Encyclopedias from Taylor & Francis Group

Agriculture Titles

Dekker Agropedia Collection (Eight Volume Set)

ISBN: 978-0-8247-2194-7 Cat. No.: DK803X

Encyclopedia of Agricultural, Food, and Biological Engineering

Edited by Dennis R. Heldman

ISBN: 978-0-8247-0938-9 Cat. No.: DK9381

Encyclopedia of Animal Science

Edited by Wilson G. Pond and Alan Bell

ISBN: 978-0-8247-5496-9 Cat. No.: DK2206

Encyclopedia of Pest Management

Edited by David Pimentel

ISBN: 978-0-8247-0632-6 Cat. No.: DK6323

Encyclopedia of Pest Management, Volume II

Edited by David Pimentel

ISBN: 978-1-4200-5361-6 Cat. No.: 53612

Encyclopedia of Plant and Crop Science

Edited by Robert M. Goodman

ISBN: 978-0-8247-0944-0 Cat. No.: DK1190

Encyclopedia of Soil Science, Second Edition (Two Volume Set)

Edited by Rattan Lal

ISBN: 978-0-8493-3830-4 Cat. No.: DK830X

Encyclopedia of Water Science

Edited by Stanley W. Trimble

ISBN: 978-0-8493-9627-4 Cat. No.: DK9627

Chemistry Titles

Encyclopedia of Chromatography, Second Edition (Two Volume Set)

Edited by Jack Cazes

ISBN: 978-0-8247-2785-7 Cat. No.: DK7851

Encyclopedia of Supramolecular Chemistry (Two Volume Set)

Edited by Jerry L. Atwood and Jonathan W. Steed

ISBN: 978-0-8247-5056-5 Cat. No.: DK056X

Encyclopedia of Surface and Colloid Science, Second Edition (Eight Volume Set)

Edited by P. Somasundaran

ISBN: 978-0-8493-9615-1 Cat. No.: DK9615

Engineering Titles

Encyclopedia of Chemical Processing (Five Volume Set)

Edited by Sunggyu Lee

ISBN: 978-0-8247-5563-8 Cat. No.: DK2243

Encyclopedia of Corrosion Technology, Second Edition

Edited by Philip A. Schweitzer, P.E.

ISBN: 978-0-8247-4878-4 Cat. No.: DK1295

Encyclopedia of Energy Engineering and Technology (Three Volume Set)

Edited by Barney L. Capehart

ISBN: 978-0-8493-3653-9 Cat. No.: DK653X

Dekker Encyclopedia of Nanoscience and Nanotechnology (Five Volume Set)

Edited by James A. Schwarz, Cristian I. Contescu, and Karol Putyera

ISBN: 978-0-8247-5055-8 Cat. No.: DK0551

Encyclopedia of Optical Engineering (Three Volume Set)

Edited by Ronald G. Driggers

ISBN: 978-0-8247-0940-2 Cat. No.: DK9403

Business Titles

Encyclopedia of Library and Information Science, Second Edition (Four Volume Set)

Edited by Miriam Drake

ISBN: 978-0-8247-2075-9 Cat. No.: DK075X

Encyclopedia of Library and Information Science, First Update Supplement

Edited by Miriam Drake

ISBN: 978-0-8493-3894-6 Cat. No.: DK8948

Encyclopedia of Corrosion Technology, Second Edition

Edited by Philip A. Schweitzer, P.E.

ISBN: 978-0-8247-4878-4 Cat. No.: DK1295

Encyclopedia of Public Administration and Public Policy, Second Edition (Three Volume Set)

Edited by Evan M. Berman

ISBN: 978-0-4200-5275-6 Cat. No.: AU5275

Encyclopedia of Wireless and Mobile Communications (Three Volume Set)

Edited by Borko Furht

ISBN: 978-0-4200-4326-6 Cat. No.: AU4326

Probability Theory / <i>Bradley J. Best and Paul J. Brennan</i>	1566
Uncertainty in Decision Making / <i>William J. Mead</i>	1984
Uncertainty, Concept of / <i>James McBain</i>	1988

Preface

This edition is dedicated to the memory of Jack M. Rabin, who founded the Book Series in Public Administration and Public Policy, of which this encyclopedia is part. Jack sadly and prematurely passed away on November 13, 2006 at age 61. He is very much missed.

Jack's legacy is one of collegiality and productivity – not least of which are the about 130 volumes that make up the Book Series in Public Administration and Public Policy. This is among the largest series in the discipline. Jack started this series and remained passionately committed to it until his death. He also created numerous journals such as the *International Journal of Public Administration*, which he served as the Editor-in-Chief. Many scholars in public administration, if not most, have published in one or more Jack's works. Directly or indirectly, it is hard to find anyone who has not benefited from Jack's dedication to expand scholarship and opportunity to all in public administration.

I am one of those who are indebted to Jack. I remember talking to him, about a week before his death, about a new project. He encouraged me to continue with it, and he made it possible for to do so. It is this spirit of support and collaboration, his spirit, that I hope to continue through this volume of *Encyclopedia of Public Administration and Public Policy*, and indeed in the Book Series itself.

With this volume, I introduce myself as the new Editor-in-Chief of the Book Series in Public Administration and Public Policy. This book series, which originally started at Marcel Dekker, is now part of the Taylor & Francis Group, at CRC Press. We will continue to solicit quality manuscripts and work with authors to contribute to the professional practice and intellectual development of public administration through books. The Book Series in Public Administration and Public Policy lives on.

The *Encyclopedia of Public Administration and Public Policy* serves multiple purposes for our field. First, leading scholars define and describe key topics of our field in what we hope are authoritative ways. The encyclopedia provides the reader with entries concerning the salient theories, issues, and concepts within the broad fields of public administration and public policy.

Second, each entry is a coherent article, rather than a short paragraph. By doing so, this work also serves as a gateway into our vast field, giving the reader both an introduction to the various subjects and references to additional bodies of knowledge, and making it relevant to experts and new scholars and practitioners alike.

Third, not only is this encyclopedia also available on the Internet, we are on-going soliciting new entries and taking the opportunity to update existing entries, too. As such, the *Encyclopedia of Public Administration and Public Policy* becomes a “living thing,” that is constantly changing and improving. All authors have had the opportunity to update their entries for this volume.

I commend Taylor & Francis for its continuing support of this series. Jack regarded this Encyclopedia as the crown of the book series, and I agree. It is thus a special pleasure to dedicate this edition to him. I express my gratitude to the contributing editors as well as to all the authors. We will continue to ask a broad range of authors to contribute. Many thanks to all!

Evan M. Berman

1993 Budget Reconciliation Bill and the Federal Budget Deficit

Patrick Fisher

*Department of Political Science/Philosophy, Monmouth University,
West Long Branch, New Jersey, U.S.A.*

INTRODUCTION

When Bill Clinton was elected president in 1992, the United States had the largest peacetime budget deficit in the nation's history. Although reducing the deficit was not a major theme of Clinton's 1992 campaign for president, Clinton decided to make deficit reduction a major priority for his administration. The 1993 Budget Reconciliation Bill, the congressionally modified version of Clinton's budget blueprint, was passed in August 1993, without a vote to spare in Congress. The key component of the bill was its tax increases on those making more than \$125,000 a year. This was a significant departure from the tax policies of the Reagan and Bush administrations, which stressed the economic benefits of reducing taxes on upper incomes.

Although the tax increases of the 1993 Budget Reconciliation Bill were not politically popular and may have played an important role in the Democrats' dismal showing in the 1994 congressional elections, evidence suggests that the tax increases have played an important role in reducing the federal budget deficit. Since the 1993 Budget Reconciliation Bill became law, annual budget deficits have declined significantly. By 1998, the federal government actually had a budget surplus, the first time the federal budget ran a surplus in nearly 30 years. In 1999, the federal government had a surplus of \$120 billion. This has dramatically changed the debate over the budget process; the deficit-reducing conventions of the 1990s are being replaced by a new set of ideas for fiscal policy. Although spending cuts have also helped in deficit reduction, a dramatic increase in federal budget revenues has been the most important reason for the reduction of the deficit.

PASSAGE OF THE 1993 BUDGET RECONCILIATION BILL

Bill Clinton, unlike most other recent presidents, demonstrated that he would immerse himself in the details of the budget. Despite the fact that it was not an issue that he emphasized while running for the presidency in 1992, Clinton also demonstrated an early effort to reduce the deficit. It was widely held that if

Clinton was to get a handle on the deficit as he promised, he must do so in the first year of his presidency, when his political capital was at its peak.

In a joint session of Congress on February 17, 1993, President Clinton unveiled his budget proposal, which included deep spending cuts but relied overwhelmingly on tax increases to bring the deficit downward. At the same time, Clinton proposed to quickly boost short-term job creation by pumping billions of dollars into new spending programs. Clinton's deficit-cutting plan was the largest in history, proposing to save nearly \$500 billion over 4 years. Of that amount, roughly two-thirds would go to reduce the deficit, while another third would be used to pay for increased job creation and long-term investment spending, making net deficit reduction at the end of the 4 years of the plan about \$325 billion.

The deficit-reduction package proposed a cut of \$493 billion over 4 years, \$247 of it coming from spending cuts and \$246 billion from tax increases, almost exactly a 1-to-1 ratio. The ratio of tax increases to spending cuts quickly emerged as the major conflict point in congressional reaction to the plan. Republicans and conservative Democrats were upset that the ratio of cuts to taxes was much less than the 2-to-1 ratio that Panetta had advocated during his confirmation hearings. Although the deficit-reduction plan made notable spending cuts, its heavy reliance on tax increases displays the difficulties the Clinton economic team had coming up with acceptable spending cuts.

Clinton's call for a tax increase was a direct repudiation of the economic philosophies of his two Republican predecessors. By aiming the taxes primarily at corporations and the well-off, Clinton is suggesting that the programs of Ronald Reagan and George Bush, which were designed to stimulate economic growth through tax cuts, came at the price of high deficits. Clinton believed that he could convince the American public—and a majority in Congress—that the economic expansion of the 1980s held negative consequences in the long run. Clinton proposed to raise most of the new revenue with an array of higher taxes on upper-income Americans and corporations, including \$126.3 billion over 6 years, mainly through a new top income tax bracket of 36% and a surtax

on income over \$250,000. Overall, more than one half of the new taxes were projected to fall on families making more than \$200,000 a year.

President Clinton's proposed budget faced its biggest obstacle in Congress with the vote on the Budget Reconciliation Bill. The budget resolution only locked in the broad deficit-reduction numbers, but left virtually all the specifics to the reconciliation process. The reconciliation bill was designed to reconcile tax and spending policy with deficit-reduction goals outlined in the budget resolution. The measure was the heart of Clinton's plan to reshape the nation's economic policy.

In the end, Clinton's economic plan emerged victorious, although just barely. The Omnibus Budget Reconciliation Act was approved in August 1993, without a single vote to spare in either chamber: it passed 218-217 in the House and 51-50 in the Senate (with Vice President Al Gore making the tie-breaking vote). The measure passed without any Republican votes, the first time in postwar congressional history and possibly the first time ever that the majority party has passed major legislation with absolutely no support from the opposition.

With the Republicans unwilling to compromise and unable to drive the process themselves, the struggle to get the antideficit package through Congress was exclusively one of rounding up enough Democrats. This was the case even though the proposal had something to offend almost every Democrat; conservatives were uncomfortable with the entire range of tax increases, and liberals were uncomfortable with some of the \$87 billion in cuts over 5 years in entitlement spending programs such as Medicare and Medicaid as well as the \$102 billion in cuts over 5 years in appropriated spending. Liberals and the Congressional Black Caucus, however, endorsed the bill early on, making moderates and conservatives the critical swing votes.

Overall, the Clinton economic plan was expected to shrink, but not eliminate the deficit. Annual deficits under the law were expected to be around \$200 billion and because nearly \$500 billion in deficits was to be eliminated over 5 years, the national debt was expected to rise by "only" \$1.1 trillion.^[1] Since enacted, the plan has reduced the deficit for the first time since the 1970s; 2000 was the eighth consecutive year with a declining deficit—a postwar record. More spending reductions and tax increases are needed to tackle the deficit problem in earnest, but the Clinton plan was a step in the right direction. The plan not only marked a major step away from the low-tax and high-deficit policies of his Republican predecessors, but also from the spending-oriented policies of Democratic Congresses. By embracing the plan, if only barely, congressional Democrats rolled the dice for their political futures,

betting that deficit reduction would improve the economy in the long run and improve their reelection prospects.

POLITICAL CONSEQUENCES OF THE 1993 BUDGET RECONCILIATION BILL

The difficulty of the passage of the 1993 Budget Reconciliation Bill demonstrates the degree that Members of Congress fear the electoral retribution for raising taxes. The anticipation of retrospective voting helps to focus legislative attention on the possible electoral consequences of voting to raise taxes even when they hear little from their constituents in advance of congressional action. Even though there was little evidence that members of Congress incurred significant electoral risks for approving new taxes prior to 1993,^[2] policy makers fear the potential consequences of voting for increased taxes.

As a result, Congress plans carefully for tax increases. They plan the timing, devise, and use processes that insulate them from interest groups, strategize to minimize the pain to voters, and build coalitions of support.^[3] Congress's aversion of risk extends to the type of taxes members of Congress are willing to raise when revenue must be increased. As experiences at the state level have shown, it is much more difficult to impose new taxes than to raise existing ones.^[4] This means that Congress tends to refuse to repeal established taxes because of the fear of losing revenue. At the same time, it does not want to introduce new taxes because a new tax can potentially have an unfavorable affect on the electorate. By making few changes, members of Congress keep past laws in effect as the best means of minimizing the political costs of taxation while maximizing tax revenue.^[5] By treating tax policy as a "non-decision" rather than as a matter of legislative choice, informal rules and behavioral patterns ensure that a policy already in place will continue in effect without new explicit decisions being made.^[6]

The fact that not a single Republican in either chamber voted in support of the 1993 budget indicates the degree of by which partisanship and ideology dominated the vote on the bill.^[7] Republicans saw the Clinton budget as a means of raising taxes and undoing the Reagan legacy that they revere. Democrats, although they were not enamored with the tax increases, believed that it was important to support the first Democratic president in 12 years. The result was a divide over the proposal that was along partisan and ideological lines. By embracing the plan, if only barely, congressional Democrats gambled on their political futures, betting that deficit reduction would improve the economy in the long run and improve their reelection prospects. Because they passed the

budget package without a single Republican vote, Democrats hoped that they would get sole credit for future success of the bill.

Democrats were buoyed by polls suggesting public support for deficit reduction, even at the cost of higher taxes. It was hoped by congressional Democrats that citizens may have come to realize that real deficit reduction would necessitate more taxes. After the Clinton budget was passed by Congress, citizens were asked about the budget deal. Despite the bitter controversy over rising taxes, Americans were surprisingly willing to pay for the new levies called for in the budget plan. According to a poll taken after the budget plan was implemented, 52% of the respondents said that they did not object to new taxes, and only 47% said that they objected. Of those who also claimed that the American public was partly to blame for the deficit, 60% said that they did not object to the tax increases (Table 1).

Democratic optimism that the 1993 budget would not be a political hindrance, however, evaporated as the 1994 congressional elections approached. As the 1994 elections proved, the Democrats' support of tax increases did not help them politically. Despite a relatively healthy economy in November 1994, Democrats who supported for the Clinton economic plan did

poorly in the midterm elections (although Democrats who voted against the 1993 Budget Reconciliation Bill fared just as poorly). More tellingly, not a single Republican incumbent lost a reelection bid for Congress in 1994. Even in an environment wherein voters were calling for deficit reduction, voting to raise taxes or cut programs proved to be a politically hazardous move for members of Congress.

DEFICIT REDUCTION SINCE THE PASSAGE OF THE 1993 BUDGET RECONCILIATION BILL

To reduce a budget deficit, policy makers must either raise taxes, cut spending, or hope that economic growth leads to increased revenues. The political battles over deficit reduction have tended to center on the degree by which spending should be reduced or taxes increased. Republicans tend to favor spending cuts, whereas Democrats, in an effort to prevent cuts of federal programs they favor, often support tax increases as a better option.

Overall, the 1993 Budget Reconciliation Bill was expected to shrink, but not eliminate, the deficit. Annual deficits have shrunk dramatically since the measure was enacted; indeed, they have shrunk much more than anyone, including the Clinton administration, predicted. The plan has reduced the deficit for the first time since the 1970s; 2000 was the eighth consecutive year with a declining deficit/increased surplus—a postwar record (Table 2). In a development that would have been believed impossible just a few years ago, there were budget surpluses in 1998–2000, the first time since 1969 that the federal government has not run in the red. Without question, since the 1993 Budget Reconciliation Bill was passed, federal budget deficits have been remarkably smaller than they had been the previous two decades.

The success of the 1993 budget at bringing in more revenue has been the most important reason for the elimination of the budget deficit. Since the 1993 budget was passed, budget revenues have significantly increased; in fact, they have increased much more than anyone, including the Clinton administration, expected. The reason for the significant increase in revenues is the combination of the progressive nature of the tax increases—they raised taxes on upper incomes—coupled with a strong economy. Those with higher incomes have done especially well since the 1993 budget was passed. Those making more than \$100,000 a year did particularly well in the economic environment of the mid-1990s; as a result, they paid more federal taxes at a higher tax rate. Since 1992, the last year the highest income tax rate was 31%, the federal government has gained substantially more revenue from those with higher incomes. The individual

income taxes received by the federal government from those making over \$100,000 increased over 108% in the 5 years after the tax provisions of the 1993 budget became law; from those making between \$50,000 and \$100,000, income taxes received increased by 36%; and total income taxes received from those making less than \$50,000 actually decreased by almost 2% over the same time period. Millionaires, however, contributed more than twice as much to the federal treasury in 1997 than they did in 1992, the year prior to the passage of the 1993 Budget Reconciliation Bill. Thus, the progressive nature of the tax increases has played a significant role in the reduction of the deficit.

The reason for the significant increase in revenues since the passage of the 1993 Budget Reconciliation Bill is the combination of the progressive nature of the tax increases of the 1993 budget—coupled with a strong economy, in which those with upper incomes have tended to do particularly well. Deficit reduction has unquestionably been considerably aided by a healthy economy. The fact that the economy has performed so well after the 1993 Budget Reconciliation Bill was enacted, however, is a strong defense of the success of the bill. Congressional Republicans were adamant that the 1993 budget's tax increases would result in an economic downturn. As Representative Dick Armey (R-TX) stated, the 1993 budget is a recipe for disaster. "Taxes will go up. The economy will sputter along. Dreams will be put off, and all this for the hallow promise of deficit reduction and magical theories of lower interest rates." Newt Gingrich, who was House Minority Whip at the time, predicted

that the bill would lead to "a job-killing recession." The health of the economy after 1993, however, indicates that tax increases on upper incomes are not necessarily a hindrance to economic growth and are a legitimate mechanism by which to balance the nation's budget.

CONCLUSION

Congress has looked toward the president to lead the process of forming the national budget ever since the Budget and Accounting Act of 1921 made the president responsible for submitting a budget proposal to Congress. Yet, for the most part, presidents have tended to focus on other priorities. Many decisions a president could try to implement to improve the budget, such as reducing the deficit, would be wildly unpopular and therefore damage the president's standing with the public. Recent presidents have tended to show little willingness to expend their own popularity by making difficult decisions on the budget.

After he was elected president, Clinton proved to be an exception to this trend. Clinton proposed a politically risky budgetary blueprint that relied heavily on increased taxes. Without a vote to spare, Clinton was able to get Congressional approval of his budget blueprint in an extremely partisan environment. Republicans attacked the plan mercilessly, while most Democrats reluctantly supported the plan in hopes that it would help to reduce the national deficit.

The fact that taxes may be necessary, but at the same time unpopular, helps to explain the Clinton administration's lack of credit for the success of the 1993 Budget Reconciliation Bill. The elimination of a federal budget deficit may be Clinton's greatest accomplishment as president. In the years since the 1993 budget was enacted, the economy has flourished and the federal budget deficit eliminated. The Clinton administration, however, has failed to reap the benefits of the achievements of his budgetary blueprint. According to a Gallup poll conducted in January 1998, 32% said that Clinton deserved no credit at all for balancing the budget. When asked who deserved more credit for reducing the deficit, the number who said Clinton was virtually even with the number who claimed Republicans in Congress.

Increasing taxes, although concentrated mainly on upper incomes, are hard to sell as being positive, even if the goal is to reduce the deficit.^[8] Deficit reduction requires one to think in terms of the long run, which is difficult for voters and for policy makers to do. Tax increases, however, are evident immediately, and much more of a factor at the ballot box.

The passage of the 1993 Budget Reconciliation Bill leaves a mixed message. It has been remarkably

successful in doing what it was passed to do: reduce the deficit. But many of those who supported the bill paid a heavy political price for their support. As Speaker Thomas Foley (D-WA) argued shortly before the House vote on the 1993 budget in an attempt to rally Democrats behind the bill, “Tonight is the time to put away the old, easy ways. Tonight is the time for responsibility.” Yet, Foley became the first Speaker of the House to lose a reelection bid since the Civil War. A heavy price to ask a lawmaker to pay for deficit reduction.

360-Degree Performance Appraisal Systems

Neil M. Boyd

School of Education and Behavioral Sciences, Pennsylvania State University, Capital College, Middletown, Pennsylvania, U.S.A.

INTRODUCTION

A 360-degree performance appraisal system is a multi-source assessment approach that taps the collective wisdom of those who work closely with an employee. The employee and their supervisors, colleagues, direct reports (subordinates), internal customers, external customers, and others may be part of the evaluation process.

Proponents of the 360-degree feedback approach offer it as a “progressive” means of conducting performance appraisal. Many contend that 360-degree feedback systems and other forms of multisource or multirater assessment methods in organizations have evolved from an innovative “nice-to-have” technique administered only to the most senior levels to a “must-have” tool for integration into overall performance and human resource management strategies. These systems appear well suited for the flexible, team-based, change-oriented organizational cultures of many organizations today.

360-Degree systems are gaining popularity because they tend to reduce the problems of previous generations of assessment methods. 360-Degree appraisal moves the manager (as appraiser) back into the “comfort zone” as she or he is now only one among a number of assessors. It greatly reduces the problems of central tendency, positive skewness, and “halo effects” in ratings that plague the boss-subordinate approach. 360-Degree appraisal reduces defensiveness on the part of the appraisee because there are a variety of assessors, feedback is presented as more balanced, and it is said to have greater face validity. It requires organizations to resolve the issue of what is meant by job effectiveness and what behaviors are causally related to it. It recognizes that subordinates are best placed to assess “leadership” or “people management” skills. The technique is helpful in defending legal challenges of the outcome of appraisals, it is presented as important in meeting the demands for employee empowerment and involvement, and finally, it is a useful tool in tapping employee opinions and attitudes.

HISTORY OF MULTISOURCE FEEDBACK AND 360-DEGREE APPRAISAL

One fact regarding 360-degree performance appraisal seems clear; the practice is not new. Contemporary 360-degree methods have roots as early as the 1940s, however, there is some disagreement regarding the exact genesis of the technique. For example, Fleenor and Prince^[1] argue that World War II German military assessment centers first recognized the value of measuring performance from multiple perspectives. By contrast, Edwards and Ewen^[2] contend that the assessment center was developed by British military intelligence in the early 1940s and was the forerunner to multisource assessments. Despite these disagreements, one point that most scholars can agree on is 360-degree performance appraisal has historical roots within a military context.

During the 1950s and 1960s, this trend continued in the United States within the military service academies. At the United States Naval Academy at Annapolis, the midshipmen used a multisource process called “peer grease” to evaluate the leadership skills of their classmates. The peer grease process, which is still used today, has a significant impact on class standing and postgraduate assignments.

In the corporate world during the 1960s and 1970s, multisource systems were used in job evaluation committees, hiring and internal selection panels (including executive selection), promotion boards, and talent selection. Organizations like Bank of America, United Airlines, Bell Labs, Disney, Federal Express, Nestle, and RCA experimented with multisource feedback in a variety of measurement situations.

Despite the fact that multisource feedback systems had been used for several decades, the use of 360-degree instruments for individual performance assessment was rare prior to the 1980s. In previous decades, performance appraisals were typically conducted in a top-down, supervisor-driven framework that was consistent with the hierarchical structure of most organizations. In the mid-1980s, organizations like duPont, Fidelity Bank, Arizona State University, and Monsanto began experimenting with multisource assessment

for development and appraisal. However, 360-degree appraisal did not replace supervisory decisions regarding performance measurement. At most, they were used as an aid in the performance measurement process.

But things have changed. Since the early 1990s, 360-degree appraisal techniques have gained a wide base of acceptance, and the idea has emerged that 360-degree feedback can be useful for performance appraisal and decision-making purposes.

THE PROCESS

360-Degree performance appraisal is employed to determine performance evaluation and/or to facilitate employee development. The specific design and implementation procedures are usually guided by the organization's goals. Within 360-degree systems, employees assess themselves, and in turn are evaluated by a number of pertinent "stakeholders." Typically, the person to be assessed reports whom he or she works with directly. This list would include subordinates, peers, and superiors, and may include customers/clients and suppliers (Fig. 1).

The supervisor responsible for the evaluation compiles a list of individuals based upon this information and upon her or his own knowledge of the employee's work responsibilities. The supervisor may

also approach others for suggestions concerning whom to contact. Ideally, the supervisor and all those who work directly with the employee rate the employee along a number of predetermined criteria (e.g., employee aptitude, task expectations, interpersonal skills, leadership skills). Usually, these criteria are considered in light of specific workplace behavior rather than on more abstract traits. In addition, the employee rates himself or herself according to the same standardized criteria. Sometimes raters provide information anonymously. Sometimes this rating is done with the aid of five- or seven-point Likert-type scales, sometimes it is done with narratives, and sometimes with both. Ratings are then analyzed in terms of relative rank (especially extreme rankings) and disparities in ratings. Extremely low scores, and disparities between raters, are used to identify areas to be addressed by the employee. Of particular note are great disparities between employee self-ratings and those of others.

After analysis, the ratings are presented to the employee. Typically, the supervisor and employee discuss the ratings, consider differences in ratings, decide upon goals to be pursued, and develop an "action plan" to help the employee meet her or his goals. The action plan may entail participating in professional development programs such as workshops and training programs; it may entail personal reflection and intentional behavior modification, or it may entail a combination of the two.

Fig. 1 360-Degree performance appraisal. (From Ref.^[2].)

POSSIBLE PROBLEMS WITH 360-DEGREE SYSTEMS

Despite the many benefits of utilizing a 360-degree approach, several authors have cautioned that like many other performance appraisal systems, 360-degree methodology is not without its problems. Boyd and Kyle^[3] proposed that 360-degree systems need to be designed and implemented by employees instead of controlled by management. An employee controlled process would reduce a number of psychological contract violations, increase organizational justice, and facilitate a democratic ethos in the workplace. Barnes^[4] pointed out that there is a potential for problems with subordinate assessments where employees desire to “get the boss” or may alternatively “scratch the back” of a manager for expected future favors. Also, the additional time and cost might be an administrative burden. Moreover, Antonioni^[5] raises other concerns. He proposed that some organizations may be jumping into implementing 360-degree appraisals without clearly defining the mission and scope of the appraisals. To prevent potential pitfalls of the system, the organization must be prepared to design a 360-degree appraisal process that supports specific missions and goals that are central to the organization. Perhaps most importantly, organization members must decide if the 360-degree approach is to be used for employee development or assessment (or both).

In addition to these concerns, Edwards and Ewen^[2] note a series of common pitfalls with 360-degree methods. The number one reason they fail is that organizations attempt to assimilate the 360-degree method within a traditional survey research scheme. In traditional survey research, investigators attempt to maximize data collection with as many items/questions as possible and with large sample sizes. In the case of 360-degree appraisal, creating measurement instruments with many items will substantially increase non-response errors. In addition, large sample sizes are not typically possible considering that perhaps eight or nine sources will rate an employee's performance. As such, statistical procedures that rely on large sample sizes in order to ensure statistical validity might not be appropriate. For example, if only eight or nine ratings are used, a simple calculation like the mean (average) might contain measurement error. In addition, organizations must consider other issues like safeguarding the process from unintentional respondent rating errors, communicating to and training organizational members on design, implementation, and evaluation of the system, and culture shock that occurs with any system that creates “change.” In short, 360-degree systems need to be designed and implemented with a great deal of thought.

360-DEGREE SYSTEMS IN THE PUBLIC SECTOR AND ITS FUTURE IN THE FIELD

It appears that over 90% of Fortune 1000 firms use multisource feedback systems for employee development or evaluation, yet its use in the public sector seems to be much more limited.^[6,7] It is difficult to assess the actual use of 360-degree performance appraisal systems in the public sector given the paucity of empirical reporting on the topic; however, a 2002 study by Glendinning^[8] indicates that 360-degree feedback has not yet been warmly received. His survey findings of 64 private and public northeast regional human resource professionals showed that 33% were currently incorporating 360-degree methods into their performance appraisal systems. Another study conducted in the public health sector showed that no local public health departments were utilizing 360-degree methods when searching six computerized search engines relating to the field of public health.^[9] The fact that the rates of 360-degree utilization appear small does not mean in reality that it is fractionally employed. It may mean that reporting of its use is lagging behind its actual implementation.

This may be the case considering that the call for 360-degree implementation has been strong in the public management and public administration literature. Since the mid- to late 1990s, many have called for the assimilation of 360-degree performance appraisal into the public sector.^[10,11] The pressure for change in the field of public personnel management has rarely been more intense. As Hays and Kearney^[12] note, “fiscal crises, a brooding and hypercritical public, and stunningly rapid movement in the personnel system's environment have exacerbated the field's traditional problems and fueled renewed calls for reform.” 360-Degree performance appraisal is but one method in the mix of calls for reform.

Much of the literature that challenges traditional performance appraisal methods is normative. Empirical studies, which assess strategy, design, implementation, and evaluation of contemporary performance appraisal methods in public management, are much less visible. Hays and Kearney reported on one study that empirically evaluated modernization within public sector human resource management, and prospects of its future direction. Included in their analysis was a focus on past and contemporary performance appraisal methods. They conducted their analysis by surveying 295 members of the American Society for Public Administration's (ASPA) Section on Personnel and Labor Relations (SPALR), and personnel directors in federal, state, and local government listed in the 1997 membership directory of the International Personnel Management Association (IPMA). Performance appraisal ranked first in importance and its

widespread use was predicted to continue. In addition, they argued that “new performance-assessment techniques such as peer evaluations, client evaluations, appraisals by subordinates, team-based evaluations, and the all inclusive 360-degree approach are anticipated to leap ahead of such traditional approaches as rating scales and checklists.” Based on their findings, a bright future for 360-degree performance appraisal is anticipated in the next decades within public personnel management.

Although the future looks bright for 360-degree implementation, there are challenges that lay ahead. Public management scholars and practitioners will have to study and evaluate the 360-degree method within the context of the public sector with an eye on the fact that it likely will not automatically transfer from the private sector. In particular, 360-degree methods will potentially contend with union, civil service, and legislative interests that pervade in the issue networks associated with public personnel management.

Accountability and Ethics: Reconsidering the Relationships

Melvin J. Dubnick

*Departments of Political Science and Public Administration, Rutgers University,
Newark, New Jersey, U.S.A.*

INTRODUCTION

The relationship between “accountability” and “ethics” has long been a concern among students of public administration. Accountability has traditionally been regarded as the means used to control and direct administrative behavior by requiring “answerability” to some external authority. It has deep roots in American constitutional history, and can be linked to the principles implicit in the Magna Carta as well as to our system of checks and balances. In public administration, ethics has most often been associated with standards of responsible behavior and integrity.

Issues about the relationship between the two were central to the Friedrich–Finer debate of the early 1940s—one of two debates that set the intellectual agenda for the field of public administration during the Cold War era (the other being the debate between Herbert Simon and Dwight Waldo).^[1] In a 1940 essay,^[2] Friedrich argued that the traditional means (e.g., oversight and control) for holding administrators accountable were ineffective and unnecessary. It was reasonable, he contended, to defer to the judgment of administrators whose sense of professional responsibility and loyalty could be trusted when they carried out public policy in the national interest. In response, Finer^[3] reasserted the widely held view that, despite the greater sense of professional responsibility among today’s administrators, democracy still requires enhanced public control and direction of administrative agents.

That exchange was—and remains—the classic expression of the conventional relationship between ethics and accountability in public administration.^[4–7] Fundamental to that view is the assumption that the commitment of modern administrators to conduct themselves responsibly (i.e., ethically, in accord with “democratic morality”) was not sufficient to ensure that the will of the people would be carried out. Accountability, in the form of external (i.e., democratic) constraints and controls, was also necessary. Accountability mechanisms were required to render the decisions and behavior of public officials responsible, not merely in the legal, political, or bureaucratic senses of that term, but also morally.^[8–10] Ethical

behavior, in short, required the presence of external accountability mechanisms in their various forms.

Does accountability foster ethical or morally responsible behavior? Despite considerable scholarship devoted to the examination of efforts to control the bureaucracy through various accountability mechanisms,^[11–20] the existence or effectiveness of the accountability–ethics relationship has yet to be systematically examined. A growing body of work on accountability implies that it has a significant impact on administrative behavior,^[21–31] but none of these studies directly address how accountability affects the ethical standards and strategies adopted by administrators.

BARRIERS TO ANALYSIS

The barriers to such an analysis have been conceptual and methodological. Conceptually, both “accountability” and “ethical behavior” have lacked the “sharpness” and clarity^[32] required for analytical purposes. The concept of accountability has been characterized as expansive^[33] and chameleon-like^[34] as applied in both theory and practice, and the appropriate meaning of ethical behavior has long been the subject of heated debate between utilitarians and deontologists (among others).^[35,36] The lack of progress in conceptualization, however, can be attributed to the institutional bias and normative ambiguity fostered by our methodological approaches to both terms. Accountability and ethical behavior are rarely perceived in behavioral terms outside the institutional contexts that preoccupy students of public administration. As a result, accountability becomes associated with certain institutional forms of oversight and ethical behavior becomes tangled in discussions of codes and legalisms. Also important has been the inability of analysts to put aside the normative “baggage” that accompanies the use of such value-laden terms as “accountable” and “ethical” when describing human behavior.^[32]

We can overcome these barriers by adopting a “middle range” or “concrete theory” perspective^[37–40] that allows us to reconceptualize both accountability and ethical behavior as “social mechanisms”—that

is, in Robert Merton's terms "social processes having designated consequences for designated parts of the social structure."^[41] Applying this approach, we assume a sociological (rather than institutional) view of accountability. The sociological view stresses the forms and functions of accountability as processes (mechanisms) that affect social actors as *situated pressures for account-giving behavior*. In this article, we focus on four general types of mechanisms that demand account-giving responses: answerability; blameworthiness; liability; and attributability.

Similarly, we regard ethical behaviors as social mechanisms constituted as norms and standards of behavior generated as partial responses to the pressures created by accountability mechanisms. In contrast to both Kantian and utilitarian views of ethics that rely on the existence of a priori knowledge or some universal standard, we assume a more naturalistic^[42] and pragmatic perspective that stresses the functional role of ethics in dealing with social dilemmas.^[43-45] Our focus is on the development and nurturing of ethical behaviors and strategies in response to major forms of sociological accountability.

THE SOCIOLOGICAL PERSPECTIVE

Three Approaches to Accountability

Analytically, the concept of accountability can be approached in three ways: historically; institutionally; and sociologically. Historically, the term itself has distinctly Anglican and feudalistic roots, and has only recently emerged as a universal standard of governance.^[46] Mechanisms similar to the modern concept of accountability, however, do have ancient roots in Athenian democracy.^[47,48] More than historical curiosities, both the Anglican and Athenian views of accountability offer insights into modern accountability and provide standards by which to assess the various approaches that emerge from sociological analyses. For our purposes, however, we focus attention on those views derived from the contemporary study of social relationships.

Institutional perspectives approach accountability as formalized means of feedback and control established with governance structures of states and corporate entities.^[49] This view covers a range of phenomena, from constitutions to financial reporting standards, and has been the dominant perspective in the study of bureaucratic accountability.^[4,6,19]

Sociological perspectives focus attention on accountability as a type of social act that is part of a larger class of social processes or mechanisms dealing with the need to repair or overcome damaged relationships resulting from "unanticipated or untoward

behavior."^[50] That group of mechanisms includes confessing to the action or seeking forgiveness,^[51] subjecting oneself to punishment or retribution,^[52,53] engaging in "good works" to make amends for the damage done or seeking the restoration of one's good name,^[54] and associated behaviors that stand as substitutes for (or complements of) giving an account of one's behavior.

Giving of Accounts

Specifically, the social "giving of accounts" occurs when one must justify or provide excuses for the action that resulted in the faux pas or untoward act that is the focus of attention.^[50] One is essentially not denying either active or passive involvement in the particular indiscretion, but is engaging in an effort to explain why one ought not to be held either fully or partly responsible. Justification involves accepting responsibility for the act, but denying the immorality or untowardness of the behavior's consequences. Excuses, in contrast, do not deny the negative consequences of the acts in question, but argue that the account giver had no choice but to act badly and was therefore not responsible.^[50,55] In this sense, an individual is "accountable" to the extent that there exists an expectation^[56] within the community that they would provide an explanation for any act regarded as worthy of account giving.

While standing as a distinct type among the class of associate mechanisms related to repairing damaged relationships, account giving may also serve as a necessary complement to the other forms. The expectation to provide a justification or excuse for one's actions may include a demand for an accounting, even if the individual confesses to the act, apologizes, and submits to punishment or undertakes restitution. Consider the case of Scott Waddle, commander of the submarine U.S.S. Greeneville that collided with a Japanese vessel, the "Ehime Maru," south of Hawaii on February 9, 2001. The incident, which led to nine deaths, was the subject of a military court of inquiry; by April, Commander Waddle had accepted "full responsibility and accountability" for the accident and made several widely publicized apologies. But in this instance, and others like it, the public admission of guilt and expression of regret and apologies did not preclude the requirement for an accounting of what took place. Thus, with each public appearance, Commander Waddle had to relive the incident and provide an account of why he acted as he did.

In contrast, there are some acts of omission or commission considered so despicable that no amount of excuses or justifications would be acceptable. For example, Adolph Eichmann, Albert Speer, and other Nazis offered defenses of their actions based on

Table 1 Types of accountability

Expectations	Structured	Emergent
Related to persons	Type A: Answerability	Type B: Blameworthiness
Related to situations/events	Type C: Liability	Type D: Attributability

accounts that they were just “following orders,” carrying out their civic and legal “duties,” or (in the case of Speer) unaware of what was taking place despite their prominent roles in the German war effort.^[57,58] No account giving in the form of excuses or justifications was perceived as acceptable.

Typology of Account-Giving Mechanisms

With its focus on actions taken in response to social expectations, the sociological perspective can generate a useful typology of account-giving mechanisms. Expectations relevant to providing an explanation for one's behavior can be viewed along two dimensions. First, the expectations can be related to specific actors or can focus on situations. Second, the expectations setting or environment can be highly structured and relatively stable or emergent and subject to fluctuation. Table 1 illustrates the resulting forms of socially relevant accountability emerging from relating these two dimensions.

In the following sections, I describe the distinctive features of the resulting four types of account-giving mechanisms and discuss the relevant literature associated with each. I also briefly consider the implications of each for generating ethical behavior mechanisms among those being held accountable. As we see, accountability and ethics are closely related both analytically and empirically.

TYPE A: ACCOUNTABILITY-AS-ANSWERABILITY

Demanding Answers

Role-specific expectations for account giving are those found in highly structured social relationships where the tasks and obligations of individuals are either clearly articulated (i.e., formalized) or so “institutionalized” (in the sense of “regularized”) that they are perceived as inherent to the position a person is occupying.^[59,60] We label this form of accountability “answerability” to stress the idea that persons who fall in this category are expected to respond to calls for giving an account upon demand. In short, that expectation comes with their role. This conceptualization

of accountability is among the most commonly used, and has been central to contemporary studies of democratic and organizational accountability.^[22,61]

Within democratic theory,^[62,63] accountability-as-answerability indicates a relationship between the governors and the governed, involving mechanisms requiring the former to inform the latter of actions taken on their behalf (i.e., in their “interest”), and allowing the latter to judge and take action against the former based on that information. The specific mechanisms involved range from accountability through elections^[64] and mediated procedures (e.g., a “vote of no confidence” in parliamentary systems)^[65] to the creation and strengthening of “horizontal” institutions (e.g., courts and ombudsman offices).^[49] Accountability-as-answerability has also played a central role in classical and contemporary organization theory, where the central problem has been to develop mechanisms (e.g., chain of command, limited span of control) and related strategies for creating and sustaining cooperative social systems.^[66–69]

Answerability Research

There have been several streams of research associated with accountability-as-answerability mechanisms, each applying a distinct model of the social relationship involved and generating a different picture of the ethical implications of answerability. One stream models answerability as a relationship between accountable individuals and the audience to which they must provide the account. In a series of articles published in the 1980s, Tellock and his colleagues found that being told one must provide a justification for a decision had a significant influence on the individual's approach to each decision.^[70–73] Moreover, individuals put in such situations were motivated to seek the approval of their perceived audiences, leading Tetlock to develop an “accountability theory” emphasizing the view of answerable individuals as “intuitive politicians... whose primary goal is to protect their social identities in the eyes of the key constituencies to whom they feel accountable.”^[74]

In contrast, a principal agent theory stream provides a contractual context within which answerability mechanisms and relationships are used to overcome the inherent “moral hazard” and “selection” problems

principals face when relying on an agent.^[75–78] Here, the answerability mechanisms are regarded as structural responses to dilemmas created by the effort of rational principals attempting to control rational agents, each pursuing their own self-interest.

A third research stream, that of the “new institutionalism,” regards organized behavior as dominated by rules and institutional norms, and would treat answerability as part of that rule structure.^[79–81] The accountable individual is a rule follower whose actions are governed by what March and Olsen have termed, the “logic of appropriateness.” Under this logic, accountability-as-answerability is dominated by three questions: what kind of situation is this?; who am I (i.e., what is my identity or role)?; and what is the rule I should follow given my identity and the situation?^[82]

Answerability Ethics

The three perspectives on accountability-as-answerability present us with alternative models of the accountable actor, and thus imply three models of ethical behavior mechanisms. The ethics of Tetlock’s intuitive politician are driven by the psychological need to be accepted by the “audience”—in the case of elected officials, the electorate or the people, and in the case of a public administrator, the client, supervisor, or stakeholder. This can result in an approach that judges the ethicality of actions on the basis of their strategic value.^[83] The ethics of the rational self-interested agent is shaped by individuals’ calculations of what actions will best suit their interests, regardless of whether those interests are focused on the accumulation of power, the accumulation of wealth, or some other goal.^[84,85] The rule followers’ ethics are primarily shaped by role expectations and the individual’s social identity—a fact that leads them to select the most “appropriate” action among alternatives based on assessments of what best fits that identity and set of expectations.

What these three ethical roles share is a reliance on exogenous signals or structures. The intuitive politician is constantly monitoring the audience for signals about appropriate behavior, whereas the rational agent is engaged in ongoing calculations about that behavior that will provide the best payoff. The rule follower, in the meantime, is always engaged in balancing the expectations associated with their social identity with the demands of the situation. All three look outward as they make their ethical choices, and all three reflect a concern for the consequences of their actions. In that sense, Type A accountability tends to make administrators rely on various forms of ethical mechanisms stressing the consequences of their actions vis-à-vis

the expectations of those to whom they are answerable. This stress on consequences will, in turn, lead to the adoption of ethical strategies drawn from teleological schools of ethics,^[86] providing logical support to the various models of bureaucratic behavior applied or implied in many positive, political, and organizational theories. Among positive theories of bureaucratic behavior, mechanisms rooted in utilitarian ethics (act, rule, and motive) are the assumed position for administrator actions. Similarly, political theories of bureaucratic behavior emphasize mechanisms that enhance the influence and power of agencies, whereas organization theories focus on the striving for autonomy, security, and resources. Implied in these models is a set of ethical strategies closely linked to Type A accountability.

TYPE B: ACCOUNTABILITY-AS-BLAMEWORTHINESS

Status-Based Accountability

Although accountability is most often thought of in terms of answerability, it is not always applied to persons in specific and defined roles. Blameworthiness as a form of accountability involves a shift in focus from specific roles and contractual obligations as an agent to one’s perceived social status and membership in some group that has status. Whereas role identifies what tasks and functions you perform, status implies power and influence within the organization.^[87] Put briefly, one is held accountable not because of one’s tasks or formal responsibilities, but because of one’s relative social position or identification with a certain group. Thus, you are held accountable because you are regarded as socially, if not organizationally, blameworthy.^[88]

In its most extreme form, Type B accountability involves “scapegoating”—that is, imposing blameworthiness on a group simply by characterizing it as the source of the undesirable condition.^[89,90] It is, in Peter Gay’s words, the construction of a “convenient Other” upon whom one can visit the blame for any problem—and against whom we can target our anger and aggression.^[91]

But accountability-as-blameworthiness can also take less extreme forms. In military organizations, for example, those at the highest echelons of any unit are deemed blameworthy and accountable for events that occur on their “watch.” This form of accountability differs from mere answerability, which is related to whether one is performing one’s specific role. Here, the primary issue is one’s status as the commanding officer that is most important.

A relevant case is that of Rear Admiral Husband E. Kimmel, Commander-in-Chief of the Pacific Fleet at

the time of the Japanese surprise attack on Pearl Harbor on December 7, 1941. There is no question that the devastation wrought by Japan's forces was causally responsible for the damages suffered on that "day of infamy." Yet, both Admiral Kimmel and Lieutenant General Walter Short, who was Commanding General of the local Army contingent, were officially blamed and sanctioned for the state of "unreadiness" at Pearl Harbor on the morning of the infamous attack, and their careers were ended despite their potential value as commanders in the war that followed.^[92] Similarly, in a statement issued in July 1997, then Secretary of Defense William Cohen held Brigadier General Terry Schwalier "personally accountable" for the lax force protection that led to the death of 19 American service personnel at the Khobar Towers bombing a year earlier.^[93] The facts in both cases indicated that there was more blame to go around than that visited on Kimball, Short, or Schwalier, but that is not the way accountability operates in the military. "In the military," observed Judith Shklar, "responsibility has to be personalized at the highest level of the organization since its system of command is built on the principles of obedience and reliance . . . We cannot afford to be philosophically discriminating when our security depends on maintaining the principles of hierarchical responsibility for victory and defeat, especially the latter" (p. 63).^[94]

Blameworthiness in Public Service Cultures

While accountability-as-blameworthiness is an accepted part of military culture [and can be found in some organizations that model themselves after the military, (e.g. some police forces)], it is rarely evident in other formal organization contexts. However, it is a pervasive presence in the extraorganizational contexts of public service. Our government and its agents operate in a culture where officials are implicitly held blameworthy for possible misfortunes, regardless of causal responsibility.^[88,94] A hurricane is an act of nature, but government meteorologists will be held accountable for forecasting its exact point of impact as well as expected intensity, and local emergency preparedness offices will be blamed if proper steps were not taken to deal with the storm's impact. In the aftermath of the September 11, 2001 attacks on the World Trade Center and the Pentagon, issues were raised about the competence and culpability of the U.S. intelligence community as well as security at America's airports. Within 2 weeks of those tragic events, the media began to castigate the policies of the U.S. Immigration and Naturalization Service for its inability to track aliens who remained in the country illegally. Like other public sector agencies, they were blameworthy;

unlike others, they were called into account for their implied role in facilitating the devastating attack.

What is involved in this form of accountability comes close to what is traditionally termed "moral responsibility." As Marion Smiley notes, in both its Christian and Kantian forms, moral responsibility implied the existence of some higher or external authority. Under those forms, blameworthiness was a matter of whether one was in a position to violate the norms of those universal standards that constituted morality. But in discussing accountability-as-blameworthiness, we are focused on the social construction of blameworthiness and the social practice of blaming.^[95] We are blameworthy as a result of our status within a community (e.g., the mayor) or organization (e.g., the general), not due to any specific task responsibilities or actual authority. We are blameworthy because we are members of a group whose members are regarded as blamable (e.g., bureaucrats, politicians), not because anyone in that group could really be an effective causal agent.

Type B Ethical Responses

The ethics of those facing Type B accountability is necessarily pragmatic in the broadest sense of that term and can take three forms beyond the mere passive acceptance of one's fate as a blameworthy actor. First, accountability-as-blameworthiness can be approached instrumentally. Faced with the social reality of blameworthiness, the accountable individual should use the situation to deal with the challenges within that context. The heads of agencies that have been subjected to severe criticism for past performance can use the opportunity to strengthen the organizations' future capacities. In response to their experiences as field-level soldiers in Vietnam, the officers who rose through the military's ranks from the mid-1970s to the 1980s developed ethical strategies that literally transformed the role of the armed forces in U.S. policy as well as the way the military was perceived by the public and perceived itself.^[96] An equally dramatic transformation of the ethical and operational norms of the Federal Emergency Management Agency (FEMA) took place under James Lee Witt, who assumed his position in April 1993 in the wake of severe criticism for FEMA's handling of recent disaster relief efforts.

A second approach is to assume a commitment to a deontological moral standard^[97] that would meet with widespread approval within the community or organization. The call for public administrators to focus on "service" rather than "steering,"^[98] to engage in the pursuit of the "public interest,"^[10,99] to adopt a professional standard of social equity,^[100,101] or to

“refund” itself in the regime values of the constitution^[102,103] are part of this effort to fill the moral void implied by the condition of blameworthiness.

The third approach is to engage in an “identity shift” by dissociating oneself from the blameworthy status or group. Under the view of social constructivism, just as certain groups are regarded as blameworthy, so other groups are inherently praiseworthy. In lieu of a tag such as “bureaucrat” or government employee, one can stress a professional identity such as city planner, park ranger, or law enforcement official. These identity shifts, in turn, have implications for the type of accountability and ethical standards to which one is subject. Of course, as social constructions, the blameworthiness of these identities can vary from place to place and over time. Police officers in a small midwestern town will face a different set of community expectations than their peers in New York or Los Angeles; similarly, the status and perception of an FBI agent in the 1990s was quite different from that of the 1950s.

Common among these three Type B responses is the establishment of credibility for public administrators as autonomous ethical actors. The post-Vietnam era commanders focused on establishing and articulating basic rules for the use of military force—rules that sometimes led them to openly resist putting U.S. personnel in harm’s way when other options were available. The military professionalism represented by the likes of George Patton were replaced by the model provided by Colin Powell and his cohort who served and suffered as field officers during the Vietnam War. The call for the public service professional to give priority to general ethical commitments is also a step toward asserting an ethically autonomous position, as is the effort to create a distinct professional identity among the public service professions. Each of these is a means toward the realization of Carl Friedrich’s model of the responsible administrator.

TYPE C: ACCOUNTABILITY-AS-LIABILITY

Law-Like Situations

In contrast to accountabilities based on the expectations related to persons, Types C and D accountabilities focus on the structure of the situation in which actors operate. Although posited as distinct types, accountability-as-liability and accountability-as-attributability would more appropriately be described as forms found at opposite ends of a continuum. At one end are highly structured contexts in which expectations are well defined and clear to all; at the other extreme are situations so vaguely defined that they

are almost devoid of stable expectations. Our current focus, Type C accountability, falls on the “highly structured” section of that range.

As implied in its name, accountability-as-liability is closely associated with a legalist view of the world in which actions are guided and assessed according to rules that carry sanctions for non-compliance.^[104] Unlike answerability (Type A), where expectations for accountability derive from the actor’s institutional role or organizational position, liability stresses the requirements of the structured situation. The nature of that structure can vary from the strictures of legal requirements backed by state sanctions to implicit contracts between two parties that carry with them rewards for compliance and/or sanctions for violations. At the core of these mechanisms is the idea that law, in a general sense, is an effective way to establish and maintain order and control.^[105,106]

In a strictly formal sense, accountability-as-liability would be limited to shaping one’s actions according to the “letter of the law”—that is, doing what is required by law and avoiding those actions prescribed under law. For Type C accountability, however, the concept of law is much broader, taking on the characteristics of both an institutional setting (i.e., the “rule of law”)^[107,108] and a context for social relationships.^[109–112]

Issues of Liability

The relationships between Type C and other forms of accountability are quite complex for two related reasons. First, ours is an “organizational society” where individuals are constantly identified by their role or status. It is rare to find a structured situation where one is completely without some role identity. Accountability-as-liability, however, tends to focus on the act and its consequences rather than on the actors or their status-derived blameworthiness. In its most stringent form, Type C accountability seeks out the actors who “did the deed” (who were directly, causally responsible) rather than the individual “in charge” or playing some other relevant role. Thus, an individual in a supervisory role/status would not be held accountable *unless* there was both evidence and willingness to link that person to the untoward activity.

For example, in the case of the infamous 1969 My Lai massacre, the U.S. Army believed that it had to treat the event as a legal case; in so doing, it found its ability to hold people accountable severely limited. Taking the legal liability route, the Army charged Lieutenant William Calley with the premeditated murder of at least four civilians. Several others in command positions at the scene of the massacre (which involved at least 175 to 200 deaths) were initially

charged, but it was later decided to drop those charges in all but one additional case due to “insufficient evidence”—a standard reflecting the legal nature of the accountability approach being applied. The exception was Captain Ernest Medina, Calley’s immediate superior officer, who was also brought to trial and charged with murder. However, there was a difference. The murder charges against him were not for specific acts of premeditated killing (although evidence indicates that he killed at least four civilians at My Lai); rather, he was charged with 102 murders under a provision of military law that allowed prosecution of those with command responsibility. He was court-martialed and acquitted of those charges. Thus, although the military could have (and did in many cases) hold many more persons blameworthy under its Type B accountability approach (and subject to organizational sanctions), it held only Calley legally liable for four of approximately 200 deaths and sentenced him to 20 years in prison. By focusing on liability, in other words, and not pursuing specific counts of premeditated murder against Medina and others, the military was unable to fulfill the need for accountability-as-liability.

This leads to the second issue associated with Type C accountability—the problem of collective responsibility.^[113] Just as the legal system has difficulty dealing with collective responsibility,^[114] liability-based accountability systems are constantly challenged by the “many hands” problem.^[115] As Dennis Thompson noted, typical solutions to this problem include applying “hierarchical” or “collective” forms of responsibility, and he finds both wanting. In their place, he advocates applying “personal responsibility” approach based on some weak causal connection between an individual and the event. In terms of the present framework, that would mean shifting from Type C to either Type A or Type B accountability—a move that raises issues regarding the integrity and fairness of any sanctions that might be imposed. Such an approach does not deal with the complex situations where even a weak causal link cannot be proven. In such cases, even the legal system has had to modify its standards by allowing liability to rest almost entirely on an individual possible “fault” rather than cause.^[116]

As with its legal equivalent, the inherent problems of accountability-as-liability are many.^[117–120] Nevertheless, it is an approach to accountability that is extremely important in public administration. A central factor shaping Type C accountability for public administrators has been the judicial treatment of two issues—administrative discretion and administrative immunity. Historical shifts in the judiciary’s handling of administrative discretion and delegation of authority cases^[121,122] have altered the jurisdictions and tasks of administrative agencies to such a degree (some

have argued) that we have witnessed a de facto constitutional transformation of the American republic.^[123] The courts’ willingness to lift the cover of sovereign immunity over the past several decades^[124,125] has been as significant in its impact on accountability, exposing administrators to legal actions and making it urgent for them to become more “constitutionally competent.”^[126]

As significant has been the general impact on public administration of the legalistic mindset fostered by these developments. Almost every area of public management has shown signs of deference to the “lawyer’s” perspective, and an abandonment of the administrator’s view of the world.^[127] The very act of entering the public service places one in a distinctive legal relationship to the state,^[128] and efforts to assure public employee integrity through Type C approaches have been pervasive and often counterproductive for the day-to-day operations of government.^[129]

Law-Like Ethics

The ethics related to Type C accountability have their roots in distinct and conflicting concepts of law. Two approaches emerge from debates among philosophers regarding the nature of law, while a third is derived from the analogical reasoning used in the practice of law.

In the philosophy of law, a major division exists between those who assume laws to be human artifacts without any inherent moral value (the *positivist* school) and those who assess laws in terms of their relation to a higher law standard (the *natural law* school). Each school generates numerous ethical positions, but for our purposes we offer them in caricature as the positivist *ethics of obligation* and the naturalist *ethics of conscience*. As applied by those who are held accountable, the ethics of obligation calls for adherence to the explicit rules that define a situation. Here, we find the ethics of neutral competence that has been so central to the norms of American public administration.^[130–133] The ethics of conscience, in contrast, is manifest in efforts to have public administrators adhere to some “higher standard” when engaged in the enforcement or implementation of the law. Here, again, we find various standards from “regime values” and “public interest” to “social equity” and “justice-as-fairness.”^[100,134–136]

A third ethical approach relevant to Type C accountability comes from the practice of law. Sunstein^[137] offered the term “analogical reasoning” to describe the type of thinking that takes place in legal practice. It is reasoning that focuses on applying laws and rules to specific cases based on how that law or rule has been applied in the past to similar (although

not identical) cases. Sunstein highlighted four features of analogical reasoning. First, it is based on the norm of “principled consistency”—that is, the need to provide some principle to “harmonize seemingly disparate outcomes.” Second, there should be a focus on the details of the case, letting the facts shape the decision. Third, analogical reasoning avoids the application of any “deep or comprehensive theory” that might overwhelm the facts of the case. Finally, this form of reasoning produces and applies standards that should be at a “low or intermediate level of abstraction.” In public administration, the ethics of “constitutional competence” advocated by Rosenbloom and Carroll^[125,126] operates at this analogical level by focusing on the need for public service employees to become familiar with their place and responsibilities within the U.S. constitutional system through relevant cases.

The common thread holding these Type C ethical strategies together is their commitment to determining what is ethical through a reasoning process—one guided by rules, the second by a higher standard, and the third through analogy. In contrast to the stress on consequences (generated by Type A account giving) and blame avoidance (through Type B), the ethical approaches of Type C accountability rely on ethical behavior mechanisms that call for an actor to engage in a certain type of reasoning that fosters consideration of procedural requirements, legal standards, or precedent.^[138]

TYPE D: ACCOUNTABILITY-AS-ATTRIBUTABILITY

Relevance of Non-Work Expectations

Accountability-as-attributability brings into consideration those arenas of social life where the rules and roles of public administration are *seemingly* irrelevant, but are potentially quite important in the environment of accountability of public sector workers. It involves those contexts where the fact that an individual holds a certain position in an organization, or that one is subject to rules and constraints in the workplace, is of little or no consequence *most of the time*. It is the context of the “non-work domain” where one lives a “private life” distinct from the public life of the government job, or so it seems. In reality, accountability pressures spillover into the private lives of all employees, both public and private.

In the non-work domain, one is subject to accountability standards that are broader in scope, more diverse, and constantly subject to change over time and from place to place. The sources of those standards are other social actors in the domain who regard

an action or behavior as requiring an accounting by some actor. In short, they *attribute* an action or behavior to an individual and would *expect* an accounting if they were in a position to demand one. This attributing behavior is regarded by social psychologists as part of our standards means for making sense of, and dealing with, the world.^[139–141] From the perspective of “attribution theory” research, this form of attribution is subject to ideological, cultural, and stereotypical bias,^[142,143] as well as situational determinism.^[144] In addition, attributions tend to be unstable and malleable by changing conditions such as information or expectations.^[72,145,146] The shortcomings of such attributions, however, have not diminished their relevance.

Being of “Suspect” Character

The link between specific instances of attribution and our Type D accountability emerges when those attributions lead to the perception of individuals as being of suspect character given the actions attributed to them. Thus, an individual seen emerging in a disheveled state daily from a local bar might be regarded as a “drunk,” and someone cited by police for speeding might be characterized as a reckless driver. An attributed behavior becomes a character attribute, and it is the fact that we are subject to such characterizations that can make us Type D accountable. Individuals whose actions in private life are found to be questionable or potentially embarrassing to their employer are likely to find themselves being held accountable for those actions, despite their irrelevance to the employee’s tasks or functions.

This is especially true for those who hold public office. In the private sector, the relevance of Type D accountability pressures is likely to depend on numerous factors, including (but not limited to) one’s position and status in the organization and the nature of the non-work behavior that triggers the concern. Is the individual a highly visible employee whose offense affects the public image of the business? Was the behavior so offensive that the presence of the individual will result in significant losses in sales or productivity unless action is taken?

Exposure to this form of accountability is unavoidable, and yet students of management have paid little attention to it.^[147,148] Scholars have long acknowledged the intermingling of social and personal factors. They were central to the work of the human relations school and played an important role in Barnard’s classic analysis of executive management.^[66,149] Interest in the relationship of family life to work has produced a stream of research in sociology and organization studies,^[150,151] including the examination of strategies developed to deal with the boundaries between work

and non-work.^[152,153] There is also research focused on the non-work lives of public sector workers, in particular.^[154–156] But, with few exceptions,^[157] little of this research considers the link between personal life and accountability.

Uniqueness of Public Office Holding

The rules that protect one's private life from public intrusions do not necessarily apply to those in public offices. Although modern society might proffer the "principle of uniform privacy" as a desirable standard for its citizens, for public office holders it is the "principle of diminished privacy" that is more likely to be applied. There are various reasons for this, including the perceived necessity to know more about the behavior of those who wield power over us, as well as expectations that public officials must achieve a higher standard of conduct in their private affairs than ordinary citizens.^[158]

Of course, accountability-as-attributability is not limited to those who hold public office. What kind of accountability is involved? Some takes the form of formal constraints on the private, non-work lives of government employees. Hatch Acts, conflict-of-interest legislation, and related policies are designed explicitly to deal with the perceived dangers of having civil servants too actively engaged in politics or private business enterprises.^[128,159–161] Other examples are found in managerial strategies to offset the potentially adverse impact of private preferences. The possibility that employees or their families might grow too attached to local communities ("going native") has led some agencies to establish personnel transfer policies to minimize the influence of non-work factors.^[162] Concern for an agency's reputation or public image is also used as a rationale for holding employees accountable for their private behavior and lifestyles. Private behavior has been regarded as grounds for adverse personnel actions, even if the behavior had little or nothing to do with the position of workplace.^[163] As significant, the courts have held that the "perception" of questionable private behavior can be used to take action against a public employee.^[164]

Type D Ethical Strategies

The ethical responses to Type D accountability pressures are likely to require that the individual accept the linkages between one's personal and professional/work lives. Two assumptions are at work here. First is the assumption that individuals accepting a public office do so with the expectation that they will be subject to diminished privacy and greater scrutiny of their behavior. Second is the fact that, in today's complex

social world, efforts to carve out a private space free from the intrusions of work or public life is all but impossible. At least some aspects of the behavior attributed to individuals in their personal lives are relevant to how they will be viewed in their working lives, and vice versa. This fact of modern social life means that the ethical demands of work life often overlap or intrude into the ethics of personal life, a phenomenon that has been at the center of many of the most popular and influential studies of American social dynamics since the 1950s.^[165–168] The result is the blurring of the lines between one's personal and work life ethics.

Thus, the individual must constantly contend with an existential conflict between ethical demands generated by one's role expectations, perceived blameworthiness or liability, and those related to one's standing as an autonomous private individual or citizen. In some cases, the solution would be an ethical position that subordinates at least some of one's personal autonomy to the demands emerging from Types A, B, or C accountability. Accepting the limits on one's citizenship rights is the price paid under certain Hatch Act provisions, just as forest rangers accept the order to move their families to the next assignment station. As significant is the choice to subordinate one's private tastes and behavior to the demands imposed by one's job or status.^[169,170]

A more positive stance has been articulated by Terry Cooper in his calls for a "citizenship ethics," which he later presents as the "responsible administrator" model.^[171,172] Subordination of the personal is replaced with a commitment to continuously reflect on one's life as a public administrator. Implied is the idea that one can achieve self-actualization through such an ethical stance, an idea that traces back to ancient ethics and its emphasis on ethics as a means for achieving the good (e.g., happiness) in oneself (in contrast to the modern focus on achieving the good for others).^[173]

At a more general level, the response to Type D accountability might be the adoption of a virtue or character ethics approach. In an environment where standards and rules are ambiguous or unstable, it would be reasonable to assume that a consistent adherence to some higher standards of personal conduct (e.g., to be trustworthy, honest, benevolent, caring) would provide some protection from the whims of accountability-as-attribution. Some have articulated this in terms of being a person of "good character."^[174] It can also involve the a commitment to act virtuously on and off the job as the situation requires,^[175–179] or at least to avoid falling prey to the "ordinary vices" that plagued us in both our private and public existence.^[180]

The ethical path selected in response to Type D accountability pressures has implications for the

Table 2 Accountability–ethics relationships

Accountability type		Ethical strategies based on	
A: Answerability	Intuitive politician	Rational agent	Rule follower
B: Blameworthiness	Instrumental	Higher moral standard	Identity shift
C: Liability	Positivist obligation	Naturalist conscience	Analogical reasoning competence
D: Attributability	Subordination	Citizenship ethics	Virtue/character ethics

general orientation of the individual toward the other forms of accountability. Deference to the intrusions of accountability-as-attributability is most closely associated with the norm of political neutrality that characterizes mainstream American public administration. A “citizenship ethics” is likely to complement the effort to promote competency-centered ethics, while implied in the virtue/character ethics approaches is a view of public administrators as more actively engaged autonomous ethical agents who understand their moral obligations.^[181]

CONCLUSION

Among the various issues raised by the Friedrich–Finer debate, those focused on accountability–ethics relationships are at once the most significant and least explored. Despite the lack of explicit attention to that relationship in the public administration literature, there are obviously considerable resources that can be brought to bear on this topic. Through the reconceptualization of the key terms in that relationship, this essay opens the door to a more thorough examination of the relevant issues.

Such an examination would begin with a further elaboration and empirical validation of the associations summarized in Table 2. If those posited relationships are validated, the implications for our understanding of administrative behavior can be significant. By focusing on accountability and ethical norms and standards as social mechanisms, we can start to reexplore the “black box” of “contingent” administrative behavior that has been so central to public administration scholarship since Herbert Simon began to model the administrative decision maker in the 1940s. Relying on social mechanisms in lieu of models and positive theory assumptions about bureaucratic behavior, we are able to consider various forms of reasoning and “reasons” that help to shape administrative choices and behavior.^[37,182]

There are also potential implications for those concerned with institutional design and administrative reform. Reformers who advocate greater accountability, for instance, typically put forward suggestions

that create or enhance answerability mechanisms. A more fully elaborated “theory” of the relationship between accountability and ethical strategies would help us to assess the potential impact of alternative forms of answerability and to explain the success or failure of various reforms. The same logic could be useful in highlighting the source of current problems. What might otherwise be perceived as an arbitrary abuse of discretionary authority, for example, might be due to the absence of (or an indifference to) Type C accountability mechanisms.

Accounting and Reporting for Private Non-Profit Organizations—Balancing Economic Efficiency with Social Mission

Walter Vance

General Accounting Office, Washington, District of Columbia, U.S.A.

INTRODUCTION

This chapter discusses how the value of economic efficiency, which is typically associated with private business accounting and operations, is increasingly being used to measure private non-profit accounting and operations financial performance. Since the mid-1990s, private non-profit organizations under the Financial Accounting Standards Board (FASB) have begun to follow the full cost accrual and consolidation model that is associated with measuring economic efficiency. This change suggests that the public choice philosophy (business efficiency in government and non-profits) has cast its shadow over the traditional progressive philosophy (social mission) that historically was the model of operations in private non-profit organizations. Specifically, the use of full costing for every project, taking a hard look at projects that are not “breaking even,” obtaining more outputs for less input, and putting extra emphasis on “earned income” in the form of donations are now all associated with the new non-profit environment. Whether the pendulum will swing back to having social mission instead of economic efficiency being the primary criteria by which private non-profits are judged is a critical question given the importance of the work that non-profits undertake. With issues like environmental degradation, poverty, and international unrest in the forefront of the news, more pressure is placed on private non-profit organizations to address these issues. How should the increasingly important private non-profit sector account, measure, and report success?

DEFINITION

Private non-profit organizations are not affiliated with a government, even though they may receive grants or aid from different levels of government. Much of

their revenue comes from voluntary contributions or earnings for services provided—not taxes.

The range of functions provided by private non-profit entities is wide. The traditional private non-profit is a charity, such as Catholic Relief Services or the District of Columbia Capital Area Food Bank. They provide services to the needy. Trade associations are private non-profit organizations but they serve their members as opposed to the public at large. The American Bankers Association is a trade organization. Like trade associations, business leagues such as local chambers of commerce are private non-profit entities. Even political action groups that lobby for legislation can fall in the private non-profit category. Private non-profits are corporations and as such must obtain corporation status from a state government. To obtain tax-exempt status they must seek approval from the Internal Revenue Service (IRS). Many private non-profits must report to the state in which they were incorporated and to the IRS. IRS form 990 is the usual way in which private non-profits provide information to the IRS on a yearly basis.

THE ROAD TO FASB AND THE EMPHASIS ON COMPETITION

A private non-profit does not have to follow FASB accounting standards. However, they cannot obtain a clean (unqualified) audit without fairly expressing their financial statements in accordance with generally accepted accounting principles (GAAP) as set by FASB. Even obtaining a bank loan may require financial reporting in accord with FASB standards. Although FASB is a private operation, it has permission from the Securities and Exchange Commission (SEC) to write accounting rules for business and provide non-profit entities. When private non-profit organizations use FASB accounting standards, they are

subject to all FASB requirements. However, some FASB rules were written specifically for private non-profit organizations. Four of the FASB standards that are specific to non-profit entities will be discussed in detail.

The financial reporting model imposed by FASB is the accrual and consolidation model with some selective use of fair value accounting (discussed later). For the most part this accrual and consolidation model emphasizes economic efficiency. All costs, regardless of whether cash has changed hands must be matched against revenue to determine whether the cost (effort) generated adequate income to break even or show a surplus. The Statement of Activities for a private non-profits (similar to the income statement of a business) differentiates among program expenses, administration (often called management and general), and fund-raising. If private non-profit organizations are formed to serve a social mission in the community, then a high percentage of expenses going to fund-raising and administration might contradict the social mission orientation. With the Statement of Financial Position (the balance sheet in business), money restricted for certain purposes can be distinguished from money that is unrestricted. While all the money must benefit the social mission as defined by the charter, some monies may be restricted to address special aspects of the social mission.

Use of the Economic Efficiency Criteria and the Accrual and Consolidation Model

The inclusion of private non-profit organizations into the FASB fold has a history behind it. FASB became concerned about the many sources of accounting rules for private non-profit organizations. Specifically, FASB felt that users of financial reports were getting inconsistent information. In some cases, FASB and others felt the accounting and reporting rules for these private non-profit organizations were too flexible and allowed the organizations to provide information that was not sufficiently candid.

Now that FASB is making the accounting and reporting standards for private non-profit organizations, this means private non-profit organizations must recognize revenue when earned and account for all costs necessary to earn those revenues in that period. If a pledge is made late in the fiscal year with the cash anticipated during the next period, then it is revenue in the year when pledged, not when the cash is received. The work, the phone calls, the web site, and the direct mailing have been done to earn the contribution during the period when the pledge was made. Thus, the pledge is considered earned revenue. On the expense side, if employees have pension benefits or other accrued

compensated absences (e.g., sick leave and vacation) the cost of those (usually some present value of the future payment) must be included during the period when they were promised even though the money will not be paid until a later date.

Consolidation is also part of the FASB approach. Separate funds to distinguish current donations from endowments are no longer used for external reporting. The total of all revenues (in consolidated format, not fund format) is reported. If the private non-profit has a sizable endowment, that endowment is part of the consolidated assets and revenues. Thus, the private non-profit may look very wealthy even in years when cash donations are low and the non-profit is facing liquidity problems. In the past, those sizable endowments could be placed in a separate fund and not counted as part of the total wealth (now called net assets) of the non-profit.

SFAS 116—ACCOUNTING FOR CONTRIBUTIONS RECEIVED AND CONTRIBUTIONS MADE

In examining Statement of Financial Accounting Standards (SFAS) 116, issued under due process by the Financial Accounting Standards Board, it is important to understand that the standard applies to private non-profit organizations that receive contributions as well as organizations or individuals that make the contribution. If a company makes a contribution to a private non-profit organizations, the timing of when (i.e., the basis) to incur the expense for the company and when to recognize the revenue for the non-profit both come from SFAS 116.

The main goal of SFAS 116 is to make sure that contributions are appropriately and consistently recorded, using the accrual logic for revenue recognition.

With respect to contributions, SFAS 116 has several broad categories that help determine when revenue should be recognized. Fig. 1 provides the categories.

Example of Revenue

Assume a private non-profit organization has the following transactions and events.

What amount can be considered revenue and in which of these categories?

1. One party contributes a \$1000 check with no conditions attached.
2. A company promises to contribute \$10,000 contingent on the private non-profit collecting \$5000 specifically to match the promise made by the company.

Categories	Revenue?
Unconditional contributions	Recognized in period received at fair market value
Conditional promises	Recognized when conditions are substantially met because future uncertainty is attached to the conditions
Services	Only if a nonfinancial asset is created and special skills ordinarily contracted are used

Fig. 1 When to recognize revenue.

- Another individual pledges \$2000 with the promise to make the donation in this current fiscal period.
- An electrician donates his time to the organization by installing wiring. The electrician's time is valued at \$500. If the electrician had not done this skilled work, the private non-profit would have had to purchase the service.
- One company, aware of the \$5000 matching requirement of the other company, promises to give \$1500 if the full \$5000 matching requirement is reached.
- A local government contracts with the private non-profit organization. The organization receives \$1200 for work to be performed in the next period.
- An individual donates \$1000 but restricts its use to a certain program.

Fig. 2 shows the results.

No conditions were applied to the \$4000 revenue consisting of two \$1000 cash contributions (Nos. 1 and 7) and one \$2000 (No. 3) pledge contribution. The \$11,500 of conditional promises (Nos. 2 and 5) would be placed in the notes to the financial statements if the conditions were not met this accounting and reporting period. For service (No. 4) notice how the revenue (\$500) from service is offset by an expense (\$500). The money received (No. 6) from the local government contract is not revenue; rather, it is a liability because the non-profit still owes the work to the local government. Having the cash is insufficient under the accrual logic to declare something a revenue. The revenue must be earned. In this case of the contract, the non-profit must do the work later and thus has a liability or future sacrifice often called unearned

revenue. In addition to liabilities, other distinctions are important in the revenue recognition logic.

Classifying Revenue into Net Assets— Permanently Restricted, Temporarily Restricted and Unrestricted

When revenue is earned by a non-profit it needs to be placed in one of three categories as designated by the donor.

- Permanently restricted—Oftentimes, the corpus or original amount cannot be spent. It is permanently restricted. Only the interest or gains earned might be unrestricted and available for current expenses.
- Temporarily restricted—This can only be spent on a certain program, e.g., health program, or cannot be spent until a later period, e.g., 3 months from now. Other temporary restrictions are possible.
- Unrestricted—Can be spent in any legal manner related to the mission.

SFAS 117—FINANCIAL STATEMENTS OF NON-PROFIT ORGANIZATIONS

The Three Required Financial Statements Under SFAS 117 are:

- Statement of financial position (balance sheet).
- Statement of activities (the term income is not used because non-profit organizations carry out activities to benefit the community not earn a profit).
- Statements of cash flow (shows the sources of cash, cash payments, and increase or decrease in cash balance, or more technically, cash and cash equivalents).

Categories	Revenue	Not revenue	Liability	Expense
Unconditional contributions	\$4,000			
Conditional promises		\$11,500		
Service as revenue	\$500			\$500
Work to be performed			\$1,200	
Total	\$4,500	\$11,500		\$500

Fig. 2 What are the amounts in the appropriate categories?

Assume that the non-profit has finished the fiscal year that went from 7/1/x0 to 6/30/x1.

Statement of Financial Position

In this first statement presented, the statement of financial position (or balance sheet) reflects the accounting equation (assets = liabilities + net assets) in that assets and liabilities are shown. Note that net assets are used in place of equity (the label to connote business ownership) and further that net assets are divided into permanently, temporary, and unrestricted categories. Net assets and the three categories are used to capture the not-for-profit nature and the types of restrictions that go with donations. Remember, also, the balance sheet is for a point in time and shows ability to pay short- and long-term obligations from the asset pool. It also shows the ability of the entity to take advantage of emerging opportunities by comparing things such as liquid assets with short-term obligations (Fig. 3).

The asset section does not have any nomenclature that is overly complex. It is arranged in terms of liquidity, from the most liquid, cash, to the least liquid, property, plant, and equipment, and long term investments. Contributions receivable parallel accounts

receivable typical of private sector business operations. Liabilities are ordered from those that need to be paid the soonest to those that need to be paid later.

In the analysis of this balance sheet, total assets, \$29,000, exceed liabilities, \$13,000, by \$16,000, suggesting a reasonably healthy financial status. For instance, the cash in unrestricted, \$2000, is sufficient to cover the accounts payable (which total \$500). A closer look reveals some possible problems. As is often the case with non-profit entities, donor restrictions can limit flexibility. The entity has a note payable that might come due soon. The note payable is \$5000, whereas the excess of unrestricted cash over accounts payable is only \$1500. Thus, the non-profit may have to borrow. An examination of the net assets section shows the type and extent of restrictions. Of the total difference between liabilities and assets, \$16,000, only \$6000 is not permanently restricted. The rest, \$10,000, is permanently restricted, which severely limits its ability to be used in the short term.

Statement of Activities

For the statement of activities, observe how the categories, unrestricted, temporarily restricted, and

	Private nonprofit organization name		
	Statement of financial position		
		6/30/x1	
Assets			
Cash – unrestricted		\$2,000	
Cash – temporarily restricted		3,500	
Interest receivable		50	
Contributions receivable		1,450	
Property, plant, equipment (net of depreciation)		12,000	
Long-term investments		10,000	
Total		\$29,000	
Liabilities and net assets			
Accounts payable		\$500	
Notes payable		5,000	
Long-term debt		7,500	
Total		\$13,000	
Net assets			
Unrestricted		\$2,000	
Temporarily restricted		4,000	
Permanently restricted		10,000	
Total net assets		\$16,000	
Total liabilities and net assets		\$29,000	

Fig. 3 Statement of financial position (balance sheet).

Revenue, gains, and other support	Unrestricted	Temporarily restricted	Permanently restricted	Total
Contributions	\$75,000	5,000	10,000	\$90,000
Income from investments	500			500
net unrealized and				
realized gains	500			500
Net assets released				
from restrictions				
satisfaction of program				
restrictions	1,000	-1,000		
Total	\$77,000	4,000	10,000	\$91,000
Expenses and losses				
Program A	35,000			
Program B	20,000			
Management and general	15,000			
Fund raising	5,000			
Total	\$75,000			\$75,000
Change in net assets	2,000	4,000	10,000	16,000
Beginning	0	0	0	0
End	\$2,000	4,000	10,000	\$16,000

Fig. 4 Private non-profit organization name; statement of activities; for the period 7/1/x0 to 6/30/x1.

permanently restricted are included, just as they are in the balance sheet (Fig. 4). Notice too, the bottom line is not profit or loss but change in net assets. Unlike the statement of financial position, the statement of activities is for a period of time, not a point in time. In this case the statement answers the question, “What has been the financial success (revenues matched against expenses) for the period 7/1/x0 to 6/30/x1?”

Overall, as presented in the total column, net assets for the non-profit have increased by \$16,000 for the period. Total revenue was \$91,000 and total expenses were \$75,000. However, when the total column is dissected, only \$6000 (\$2000 from unrestricted and \$4000 from temporarily restricted) of the change in net assets is not permanently restricted. Most of the change in net assets (\$10,000) comes from the permanently restricted category. Overall, the organization brought in more money than it spent (on an accrual basis) but a significant amount of the financial success is permanently restricted.

Statement of Cash Flow

The statement of cash flow is designed to show where the cash came from and where it went. For instance, if a private non-profit entity gets most of its cash from borrowing or grants, then future survival

may be in question. Will the grants continue and will contributions be sufficient to repay amounts borrowed and any associated interest payments? Raising cash via heavy borrowing will show in the statement of cash flow and such information can be vital to outsider readers of the statements. The statement of cash flow also shows whether the amount of cash changed (grew, stayed the same, or dropped) during the period.

SFAS 124—ACCOUNTING FOR CERTAIN INVESTMENTS

Non-profit entities often receive stocks and bonds as donations. SFAS 124 applies to equity securities (i.e., purchase or donation of stocks) with readily determinable market value and all investments in debt securities (e.g., purchase or donation of bonds). With SFAS 124 comes the interjection of “fair value” accounting and reporting (as opposed to historical cost accounting and reporting, which is used for most items such as property, plant, and equipment) and other rules related to investing in securities. On the surface, fair value accounting is not overly complex. Often called “mark to market,” it means that even those increases or declines in the value of securities not sold (so called “paper changes”) must be recognized at the end of the period. If the value goes up during the reporting

period, that is an unrealized holding gain. It goes on the statement of activities as a part of revenue. If the value falls, even without a sale, that constitutes an unrealized holding loss. It too goes on the statement of activities as loss subtracted from revenues. Unrealized gains and losses would also affect the balance sheet value of the investment. Presumably, outside users of financial statements (e.g., donors) are better informed about the financial performance and quality of management with the application of fair value accounting for securities.

The simplicity of “fair value” reporting stops at the conceptual level and becomes much more complex in implementation. The use of fair value depends on an array of circumstances, including for stocks, the amount of a company that a private non-profit owns. When a non-profit holds a large stock endowment in one company, the accounting becomes complex. A private non-profit may own 30% of a company from an endowment. If so, the accounting becomes even more complex and can likely move away from the fair value approach to an approach called the equity method where the non-profit shows the earnings or losses of the company as part of their own revenue and value. For instance, if a non-profit owns 30% of a company and the company loses \$90,000 dollars, then the non-profit shows a \$30,000 loss.

SFAS 136—TRANSFER OF ASSETS TO A NON-PROFIT

The complete title of this SFAS (136) indicates its focus. The full title is “Transfer of Assets to a Not-for-Profit Organization or Charitable Trust that Raises or Holds Contributions for Others.” As might be expected from the title, this SFAS is designed to answer the question about how a non-profit reports a contribution when the donor specifies another entity to ultimately or potentially receive the donation. SFAS 136 is of particular interest to federated fund-raising organizations. The United Way is an example of a non-profit that will be affected by this standard. It often collects donations and contributions that will be transferred to another non-profit organizations.

In the terminology of SFAS 136, the unit receiving the assets is the recipient while the unit that will or can ultimately get the assets is the beneficiary. The contributor is the donor. It is the donor’s specifications that affect the answer to how the recipient and beneficiary account for the donation. As with other accounting rules, SFAS 136 can become more complicated as is the case when the recipient and beneficiary are economically interrelated (one is a subsidiary of the other). Then both can share a stake in the donation.

SOP 98-2—ACCOUNTING COSTS OF ACTIVITIES OF NOT-FOR-PROFIT ORGANIZATIONS AND STATE GOVERNMENT ENTITIES THAT INCLUDE FUND-RAISING

People who donate assets to non-profit organizations as well as auditors who render opinions on non-profit financial statements have been concerned that amounts spent on fund-raising can be underreported to make it look like the non-profit is putting most of its expenses in mission-oriented programs. As a result, the American Institute of Certified Public Accountants wrote a statement of position (SOP) to clarify accounting and reporting for fund-raising, SOP 98-2.

Generically, the accounting term used to deal with this issue of allocating costs when more than one type of product is generated from the same process is “joint costs.” In business, a typical example is allocating a portion of a cost on one cut of meat when there is only one expense for the entire carving process. In a non-profit, an example is allocating the costs of postage, envelopes, labor, and machinery when educational or program information and fund-raising are included in the same mailing.

If an effort includes both fund-raising information and another activity such as the educational aspect of the social mission, allocation of joint cost to both program and fund-raising expenses can be used only if certain criteria are met. The activity must call on the audience to do something about the social mission. If the letter, for example, is directed toward environmental cleanup, then the letter must call for specific action such as attending a Saturday morning neighborhood cleanup. Simply saying that clean neighborhoods are important is insufficient for allowing the cost to be counted as program expenses as opposed to fund-raising expenses. If a specific, mission-oriented action is requested, an allocation between fund-raising and program expenses can be made.

Even the call for action may not be sufficient to allocate costs between fund-raising and program expenses. The audience selected should be people who believe in the mission. If the audience is selected because of past contributions, then all costs go to fund-raising. If the outside firm developing the campaign receives compensation on the basis of the assets donated, then all costs must be assigned as fund-raising costs.

CONCLUSION

Traditionally, private non-profits were considered to be driven by a social mission. In the mid-1990s, the accounting rule-making body for publicly traded companies, FASB, became a part of the life of private non-profits. As a result, private non-profit

organizations have a significant economic efficiency criterion to meet, and they did so, in part, by following the accrual and consolidation model (complemented by fair value) that FASB place on them. The new model demands more output for less input and hard decisions about projects that fail to break even—not exactly a “kinder, gentler” type of accounting!

Private non-profit entities are still adjusting to the dual forces of the competitive mentality of global markets and the world of social upheaval. In short, charity is in a new realm of competing in the market place for money and even for delivering services. Many for-profit agencies wish to sell the same services non-profits provide. The demands on private non-profit operations are considerable. They have their social mission to pursue, they must compete perhaps more

so than in the past, and they are considered to be an important part of maintaining world social order.

Accounting, Financial

Mozaffar Khan

University of Toronto, Toronto, Ontario, Canada

INTRODUCTION

It is said that to truly understand a culture one must be proficient in its language. Financial accounting is the language of business. Just as linguistic constructs (or words) are used to articulate our unobservable thoughts to listeners, so also are financial accounting constructs used to communicate summary information to a firm's external stakeholders about the economic activities of the firm. Similarly, just as linguistic rules guide how we meaningfully string together words, so also do financial accounting rules govern what, when, where, and how information is summarized and transmitted to outsiders to best convey the firm's economic fundamentals.

The set of financial accounting rules is commonly referred to as generally accepted accounting principles (GAAP). There are two kinds of GAAP in the United States—GAAP for business and GAAP for government. The latter defines accounting standards for the various federal, state, and local governments and agencies. The primary rule-making body for business accounting standards in the United States is the Financial Accounting Standards Board (FASB), which derives its authority from the Securities and Exchange Commission. The primary governmental accounting standard setter in the United States is the Governmental Accounting Standards Board (GASB). Both the FASB and the GASB are arms of the Financial Accounting Foundation.

FINANCIAL ACCOUNTING FOR BUSINESS

The FASB's Conceptual Framework of Accounting is a collection of overarching objectives and principles that informs its promulgation of rules and serves to impose internal consistency on the set of rules. According to this framework, a primary objective of financial statement reporting is to provide information to investors, creditors, and other external stakeholders that is useful in helping them assess the amounts, timing, and uncertainty of the firm's future cash flows. Four of the primary desired qualitative characteristics of useful financial statement information are held to be

relevance, reliability, comparability, and consistency. Relevant information is that which is timely, facilitates prediction, and updates prior information. Reliable information is that which is faithfully represented, neutral, verifiable, and conservative. Comparability requires that the financial statements be presented in a uniform format, using standard accounting rules, across companies. Consistency requires that a given company have accounting policies, choices of accounting method, and format of financial statement presentation that are consistent over time.

The Business Financial Statement Reporting Environment

Considerable complexity is introduced into the financial statement reporting environment by the fact that it consists of multiple parties whose interests are not necessarily aligned with each other. This problem is addressed in the principal-agent theory, which examines the conflict of interest between the principal or owner of a business and the agent or manager hired to run the business. Typically, because the agent is involved in the day-to-day operation of the firm and the principal is not, the agent has more information than the principal about the future prospects of the firm. This information asymmetry gives agents the opportunity to further their own interests at the expense of those of the principal. In the financial reporting context, managers (who are the agents) may seek to release only self-serving information to investors and creditors (who are the principals). This is known as the adverse selection or hidden information problem, and its existence hinders the achievement of the financial reporting objective assumed in the Conceptual Framework of Accounting (the provision of useful information to investors and creditors). Thus, accounting rules have to be designed to mitigate the adverse selection problem.

Another principal-agent problem arises from the fact that efforts exerted by agents in discharging their responsibilities are not fully and directly observable by principals, thereby giving agents the opportunity to shirk. This is known as the moral hazard or hidden effort problem. Because firm performance is driven by

various factors other than managerial effort, it is not possible for the owner to fully infer managerial effort after observing firm performance *ex post*. Consider a firm that has high performance in a given year despite low managerial effort and low performance in another year despite high managerial effort. If managerial compensation is tied to firm performance, the manager gains *ex post* at the owner's expense in the first instance and the owner gains *ex post* at the manager's expense in the second instance. *Ex ante* however, neither party knows who is going to gain. The point here is that it is important to both the owner and the manager that performance measures are highly correlated with managerial effort so that effort may be reasonably inferred from performance. The implication for financial reporting is that accounting rules governing performance measurement should be designed to mitigate the moral hazard problem.

Both adverse selection and moral hazard result from information asymmetry. This asymmetry cannot be completely eliminated and can only be reduced at some cost. For example, an owner may devise elaborate monitoring and reporting schemes, but these would be neither perfect nor inexpensive. Financial accounting rules are therefore also designed to balance reporting costs with reporting benefits.

Business Financial Accounting Research

Financial accounting theory is rooted in economic theory. Theoretical financial accounting research involves building economic models that help understand, explain, predict, and control the financial accounting environment. These models may also guide the design of new accounting rules.

Empirical financial accounting research uses econometric methods to test theoretical models. It also tests whether new accounting rules better capture a firm's economic fundamentals. Typically, accounting researchers assume that capital markets are semi-strong form efficient, that is, that all publicly available information is reflected in the current stock price. If a new accounting rule allows financial statements to portray more accurately the underlying economic position of the firm then it should be useful to investors and creditors in making rational investment decisions. Thus, the establishment of the new rule should bring new information to the market and, given market efficiency, should lead to revised market expectations of the amounts, timing and uncertainty of future cash flows. These revised expectations can lead to any of three testable effects: they may lead to abnormal stock returns, abnormal trading volume and/or abnormal stock price volatility. The presence of any of these effects then is

held to be evidence of the decision usefulness of the new accounting rule.

Selected Topics in Business Financial Accounting Research

Voluntary disclosure

This literature examines why managers issue forecasts of quarterly or annual earnings per share (EPS) and otherwise reveal to the securities markets private information about the firm's future prospects when they are not mandated to do so by SEC disclosure rules. Four suggested motives and reasons for voluntary disclosure are legal liability, adverse selection, expectations adjustment, and transactions cost. In the following discussion, news refers to private EPS information relative to current public expectations of future EPS (e.g., bad news refers to private management information that actual EPS will be substantially below what the market expects, while no news refers to information that actual EPS will be very close to expected EPS, either from above or below). Under the legal liability argument, managers who suppress bad news may be successfully sued by investors for the loss suffered once actual performance is realized and disclosed in the future, and the stock price plummets. Thus, managers are expected to preemptively disclose only bad news prior to the mandated earnings announcement date to mitigate their legal liability. Under the adverse selection hypothesis, managers preemptively disclose only self-serving or good news to immediately boost the price of their firm's stock. The expectations adjustment hypothesis posits that managers preemptively disclose both good and bad news, but not no news, to "correct" the market's expectations. The assumption is that the market does not like negative surprises (or bad news) on earnings announcement dates and that the firm is better off revealing positive surprises (or good news) as early as possible. Finally, the transactions cost hypothesis argues that a firm's managers will disclose all private information to investors to lower investors' information costs in acquiring that firm's stocks and to increase investor confidence in the firm. This in turn will translate into a lower cost of capital for the firm.

The empirical evidence is mixed as to which motive best explains voluntary disclosure, but the transactions cost hypothesis appears to be the weakest of the four. For more information, see Refs.^[1-3]

Positive accounting theory (PAT)

GAAP often allows managers some discretion in their choice of accounting method (first in, first out vs. last

in, last out for inventory, straight line vs. accelerated method for depreciation, etc.). Given discretion, why do firms make the choices they do? Note that an accounting policy simply determines how an economic event is portrayed. It does not change the economics of the event. Inspired by positive economics and motivated by agency theory, PAT attempts to explain firms' accounting policy choices. In other words, it attempts to explain why certain economic events are accounted for in the manner they are. It argues that a firm can be viewed as a web of contracts between multiple parties (managers, investors, creditors, regulators, consumer groups), with each party seeking to achieve its interests over, and perhaps at the expense of, those of others.

For example, consider the conflicts in the manager-stockholder relationship. If managers are compensated based on reported earnings, then they will choose income-increasing accounting policies so that their compensation will increase despite the fact that there has been no change in the economic value of the owners' equity in the firm. Another conflict arises when outside investors attempt a takeover of the firm. Although their offer may be in the best interests of the current stockholders, it may be rebuffed by managers if they fear that they will be displaced by the new owners.

Consider, too, the conflict in the creditor-stockholder relationship. Managers, acting on behalf of stockholders, may attempt to circumvent financial limits stipulated in the debt indenture to avoid triggering a technical default. For example, if the indenture calls for the firm to maintain a certain minimum level of return on assets, then managers may opportunistically make accounting policy choices that increase reported income or decrease average total assets when they are in danger of falling below the specified minimum.

Finally, firms are also believed to have a latent social contract with society. If an industry or firm finds itself reaping excess or abnormally high profits, then it may attract the scrutiny of governmental regulators or consumer groups. For example, if firms in the oil industry rake in excess profits when the price of gasoline is high, then they may be suspected of price gouging. Positive accounting theory predicts that such firms will attempt to depict earnings as being lower than they are and will thus make accounting choices that decrease reported earnings to avert attention.

Empirical research has found evidence of accounting choices broadly consistent with those predicted by PAT. For more information, see Refs.^[4-6].

Earnings management (EM)

This literature examines whether managers opportunistically manipulate reported earnings up or down.

For example, if current earnings performance is poor, then managers may "borrow" earnings from future periods to increase current reported earnings to acceptable levels, or if current earnings are exceptional, then they may "store" some earnings to use in future periods. The motive for this may be to meet market expectations or to maximize their bonus. Another example of EM is a "big bath"—a new chief executive officer (CEO) may have the management team aggressively record write-offs and other charges in the current year so that good performance is easier to achieve in future years. In effect, the new CEO "cleans house," knowing that a huge loss in the current year will be blamed on the predecessor and good performance in future years will be self-attributed. Earnings management may also occur when a domestic industry petitions the federal government for import relief. This industry may manage its reported earnings down to bolster its claims of damage from foreign competitors and their products.

This literature assumes that managers believe that capital markets are fixated on the reported earnings figure and that the market is unable to fully detect EM. If managers believed otherwise, then they would not engage in EM because doing so would be futile. Clearly, managers would like to manipulate earnings surreptitiously. The literature therefore generally assumes that EM occurs through the manipulation of accrual accounts because this is the least easily detected.

Empirical researchers have attempted to identify specific instances of EM to prove that the phenomenon exists in reality. For any given firm, only its total accruals are observable or identifiable. The managed portion of total accruals cannot be identified from financial statements. Typically, the researcher will specify a statistical model that generates the expected level of "normal" total accruals in any given year. The difference between expected accruals and actual total accruals is the "abnormal" accrual for that year. Abnormal accruals are held to represent the manipulated portion of total accruals. This decomposition of observable total accruals into its unobservable normal and abnormal components is heavily dependent on the mechanism that is assumed to generate "normal" accruals. Thus, findings of abnormal accruals constitute evidence of EM only insofar as the normal accrual-generating model is correctly specified. For more information, see Refs.^[7] and ^[8].

Anomalies

As mentioned previously, a key maintained hypothesis in financial accounting research is that capital markets are efficient. The anomalies literature attempts to debunk this hypothesis by investigating instances where market efficiency is apparently violated, that is, where

public information that is marginally useful in predicting a firm's future performance is apparently not incorporated in stock prices. The typical approach adopted by researchers is to use some public information to develop a trading strategy that yields excess or risk-adjusted returns. The implication then is that this information could not have been incorporated in stock prices and that the markets are inefficient. For example, certain financial statement information may be used to predict which firms will experience robust performance and which will experience poor performance. Next, a long position may be taken in the first set of firms and an off-setting short position in the second set of firms, under the assumption that the stock price will rise in response to strong realized but unanticipated performance and decline if performance turns out to be poor. If markets are efficient, then future performance implied by all current public information should be anticipated in the current stock price and there should be no stock price reaction once performance is realized as anticipated. However, if the market is not efficient with respect to some information, then the previous trading strategy should yield positive net returns.

Another example of an anomaly is the postearnings announcement drift. It is observed that the stock price of firms that announce robust earnings performance tends to drift upward for an appreciable period of time after the earnings announcement date, and a similar downward drift is observed for firms announcing poor performance. The anomaly here is that this phenomenon is a documented empirical regularity; that is, there continues to persist this period of time over which price movements are predictable. Consider a firm announcing poor current earnings. If investors are aware of the drift phenomenon, then they should immediately short the stock once earnings are announced. The stock price will drop immediately as a result, and no drift will occur thereafter. However, this does not happen. The drift phenomenon continues to be observed.

A third example of an anomaly would be an abnormal stock return response to an accounting method change. In efficient markets, an accounting method change should generate no abnormal returns because it merely changes the way an economic event is accounted for, or depicted, and does not change the underlying event itself.

One explanation for these anomalies is that researchers who have developed hypothetical trading strategies to exploit apparent market inefficiencies have not taken transactions costs or short-selling constraints into account. The costs incurred in searching for mispriced securities and buying or selling them can be substantial, and may offset the marginal benefit of engaging in such activity. Another explanation is

that risk factors may not be fully controlled for. For example, market efficiency would call for abnormal returns in response to an accounting method change if this change also leads to a change in the firm's risk.

It is important to note that market inefficiency does not imply investor irrationality. An ostensible profit opportunity may not be exploited if the mispriced stock is available only in limited quantities or if the transactions costs are prohibitive even though the stock is available in unlimited quantities.

Although significant evidence of apparent market inefficiency has been tendered, it has not been as unsailable as to warrant abandonment of the assumption of market efficiency, especially in the absence of refutable alternative hypotheses. For more information, see Ref.^[9].

Earnings response coefficient (ERC)

In an efficient market, a firm's stock price changes only in response to revised investor expectations about the amounts, timing, and uncertainty of its future cash flows. One stimulus for expectation revision is unanticipated earnings. Faced with an earnings surprise, investors try to assess how long they can expect the unanticipated portion of earnings (termed the earnings innovation) to persist. This persistence assessment is then fed into an asset valuation model, such as the discounted cash flow (DCF) model, to yield a new price. The earnings persistence is a parameter of the firm's time series of earnings. Typically, a pure random walk is held to be a reasonable description of a firm's time series of annual earnings, implying that all earnings innovations are permanent. Given this, and assuming a one-to-one link between earnings and cash flows, the DCF model simply prices a stock with a dollar earnings innovation as the current stock price, plus a dollar, plus the value of a dollar in perpetuity.

The ERC is the marginal stock price change in response to a \$1 earnings innovation. For example, given the previous assumptions, and a discount rate of 10%, the ERC should be $1 + 1/0.1 = 11$. Empirical ERC estimates have been substantially lower, however, spawning a large literature attempting to explain this attenuation. One explanation is that a portion of the supposedly unanticipated earnings was actually previously anticipated by market participants, so that the earnings innovation or surprise is measured with error. Attenuation due to measurement error in the earnings surprise can be mitigated by using a reverse regression econometric design. Another explanation for the observed attenuation is that a portion of the unanticipated earnings may be transitory; that is, it may have resulted from one-time gains or losses rather than from continuing operations. However, empirical ERC estimates have been shown to remain attenuated,

even when transitory items are removed from reported earnings. Finally, it has been argued that the marginal investor response to losses is lower than that to profits because losses have less information content than profits about the future prospects of the firm. Losses are less informative than profits because losses are not expected to occur in perpetuity. They can also be less informative as a result of the application of the conservatism principle of accounting, under which managers are quicker to recognize foreseeable losses than to recognize foreseeable gains. Reported gains are a lot more certain than reported losses. For more information, see Refs.^[10–13].

FINANCIAL ACCOUNTING FOR GOVERNMENT

The goals and accounting environments of government and business differ. These factors lead to differences between GAAP for government and GAAP for business.

Although the goals of business are typically to maximize return on investment, the goals of government as recognized by GASB are twofold—accountability to citizenry and promoting the common welfare. These give rise to the external financial reporting objectives of the GASB. One objective is to demonstrate accountability. This implies providing information that is useful in assessing accountability, including such information as whether there was intergenerational shifting of resources. For example, will some current-year services be funded partly by future-year citizens, or are some future-year benefits funded by current-year citizens? Another objective is to report on current operating results by revealing the sources and uses of revenues. A third objective is to report on the entity's financial condition in terms of its long-term financial viability. Finally, a fourth objective is to report on long-lived physical and non-financial assets, and their future service potential.

The Governmental Financial Accounting Environment

In setting accounting standards, the GASB is mindful of certain characteristics that are peculiar to the governmental accounting environment. One salient characteristic of this environment is that decision making within a governmental entity is far more political, because of its public nature, than decision making within a corporate entity. In addition, governments have to balance the needs of diverse constituents who often have conflicting notions of the common good. Another characteristic is the use of fund accounting by governments. A fund is its own fiscal and accounting

entity, set up to ensure availability of resources for a specific purpose. The monies from a given fund can only be applied toward the designated purpose of that fund. Usually, the General Fund is the only unrestricted fund in a government entity. Although separate financial reporting for each fund is no longer required, each fund still has to maintain its own books. Yet another characteristic is that governmental budgets are legal documents in that they often carry the force of law. They cannot be altered once passed. They are also public documents because they are products of the public intent as revealed through public hearings and dialog. This is in contrast to corporate budgets that have the discretionary flexibility to respond to changing conditions through the fiscal year and that are secret for competitive reasons.

A fourth characteristic is that some entity may be affiliated with a governmental entity, yet offer private services. The conflict here is whether to follow government or business GAAP. For such entities, the compliance hierarchy is GAAP for government first, then GAAP for business, followed by other sources of accounting standards such as experts, common practice, and the accounting literature. A fifth characteristic is that resources are often transferred from one level of government to another, requiring intergovernmental accountability. For more information, see Refs.^[14] and ^[15].

Governmental Accounting Research

Research in this area examines diverse questions, such as performance measurement, the impact of incentives, the impact of politics and the tenure of elected officials, discretionary accounting practices, and the accounting and auditing impact of intergovernmental revenue sharing, to name a few.

A prominent issue in governmental accounting today is whether to move toward accrual-based accounting as is required for businesses by business GAAP. Governmental accounting today typically follows a modified accrual method, thereby hiding such future liabilities as past service (or pension) costs.

CONCLUSION

Financial accounting is a vast and vibrant field. Accounting practice (both for business and for government) is constantly evolving to meet changing needs, and accounting research is gaining rigor in theory as well as sophistication in empirical methods. It is impossible to understand the culture and environment of financial management without understanding financial accounting.

Achieving Productivity through Budgeting

Gerald J. Miller

Donijo Robbins

School of Public and Nonprofit Administration, Grand Valley State University, Grand Rapids, Michigan, U.S.A.

INTRODUCTION

Budgets serve many purposes, all of which can promote productivity. The budget serves as a plan, a means of control, a motivation device, and a process for accountability. At its narrowest, a budget is a plan that estimates proposed expenditures for a given period, usually for a year or a “fiscal” year, and relates planned spending to an estimate of revenues needed to finance the plan. The budget also acts as a control device, directing that only the amount specified in the budget be spent in the way the budget dictates. In this sense, budgets control the amount of scarce resources fed into the governmental system, as well as the size and nature of the programs within the budget. Budgets offer incentives, implying a contract in which a set amount of performance or results is exchanged for a certain amount of resources. Finally, budgets improve the accountability of government to citizens by making budget decision making public. That is, government budgets reveal to the public the amount of money spent, with what results, and often why it was spent.

BUDGETING AND PRODUCTIVITY

Budget designers create a process that forces managers to consider different programs, often in competition within and between government departments. Managers commonly employ a simple economic idea—that any alternative must be judged in terms of other alternatives. Budgeting for productivity involves analysis, and proponents of analysis argue that explicit or systematic examination of alternative policies allows the public to hold its public officials accountable for performance.

Budget designers have productivity concerns in mind. In narrow terms, productivity may refer to economic efficiency, a surplus of the goods or services produced over the resources used in their production. Closely akin to this idea are two others: achieving the highest levels of effectiveness for a given investment

and choosing the least costly investment that will yield a given level of performance. These often translate through budgets into managerial plans, controls, and incentives for more innovative programs and greater performance.

Another view of productivity holds that budgets should steer government agencies to spending on projects with large, durable returns on investment. Budgets can favor productivity by encouraging choice and favoring alternative investments that have larger returns for the public resources committed to projects, agencies, and activities.

Political leaders make ultimate budget decisions. Political decisions are often based on the geographic distribution of spending and log rolling in which political leaders trade support for each other's favored spending plans. Compromise-driven politics tend to dampen any resolve to increase the effectiveness or efficiency in government programs. Much more emphasis gets placed on maintaining the existing distribution of budget resources, thereby making innovative choices seem irrelevant to the process.

Given all the effort to make the budgeting process favor more productive programs, politics still overshadows economic efficiency as the basis for budget decisions. Thurmaier's research supports this.^[1] He suggested that “conflicts between political and economic imperatives are handled subtly in practice, but it appears that economic and technical calculations are subordinated to prior political determinations.”

Since the era of modern budgeting began in the early twentieth century, government budgets have undergone various reforms. First, the line item budget was a rudimentary way of recording and balancing expenditures and revenues; as such, the line item budget produced accountability. Early performance budgeting was a method of going one step beyond the line item budget by classifying items by function and determining the efficiency of the budgeted expenditures. Functional spending revealed how much revenue was needed to produce a certain level of program production. Next, there was program budgeting, which combined

planning and budgeting, and promoted the economic analysis of allocation choices. Zero base budgeting decentralized decision making in an effort to redirect funds from existing programs to new programs. Finally, performance base budgeting attempts to tie the allocation of resources in budgets to the improvement in program performance, the achievement of results, and the success of efforts to realize strategic outcomes.

The success of these reforms has not been impressive. Few have lasted beyond the administration of the executive who instituted them, or they have lasted in only a single department. Although many contextual factors may have led subsequent administrations to seek other methods of budgeting, most reforms have failed to combine a sharp sensibility for both productivity and politics. One former analyst for the legislative branch observed that the “failure of [reform] efforts . . . are largely a result of an inability to account for politics. No set of budget techniques can substitute for political decisions about who wins and who loses.”^[2]

PRODUCTIVITY-ORIENTED SPENDING DECISIONS

If the conceptual linkage between productivity and budgeting is stronger than that revealed in the practice of budgeting, efforts attempt to narrow the difference. These greater efforts have rested in the major and minor modifications of productivity improvement and budget practices; productivity-friendly and budget-friendly reforms may bridge the gap between the concepts and the practices of productivity improvement and budgeting. Productivity-friendly elements refer to reducing the budget process’ outright exclusion of productivity goals. Budget-friendly elements empower productivity programs to work inside budget routines.

Productivity-Friendly Budget Elements

Budgeting serves many purposes for decision makers. Lauth^[3] warned of the pitfalls of using budgeting as the handmaiden for productivity improvement. The budget is simply too cumbersome to help, he said. Rather, the budget can be made less hostile and more friendly to the ideas underlying productivity improvement. Three major groups of efforts narrow the differences between management and politics: technical modifications, support for measurement, and incentives.

Technical modifications

Small, technical modifications could overcome some of the barriers between budgeting and productivity. For example, many opportunities for cost savings through

transfers among budget categories and line items within the fiscal year are forbidden without legislative approval. To illustrate, purchases or repairs may be deferred due to this restriction, forcing more costly ones later. Budgeted personnel lines are seldom able to be converted to any other object class or vice versa. Thus, consultants may be allowed for many times the expense of a fully trained, permanent employee. Finally, central finance offices often pull back from productive line units salary savings due to attrition, unpaid leads, or other temporary absences. The department is shackled to lower-level performance—fewer people to do the same amount of work—without the opportunity to use the same salary savings to reward employees for what might be a temporary bulge in workload.

Support for measurement

Productivity and budgets often stand at arms length when the performance-to-budget dollar measurements became complicated or numerous. In truth, agreement about valid measures of public sector work performance only exist on the input side, such as dollars given to school districts. Many blame time limits, training gaps, and primitive computing capability for the lack of development in the other areas, whereas others blame the incoherence in the organization segregation and information flows between program evaluation and budgeting.

In one of the clearest insights into the operation of budget offices, Grizzle^[4] dispelled much doubt about the ability to solve these problems. She found that many efforts to create time and develop information would involve negligible amounts of the central budget office’s work year and little cost.

Her view is that measurement problems could be less considerable and more mythical than believed, if measurement were merely a technical problem, not a problem that becomes politicized. When measurement is a political problem, it becomes one of several behavior problems for which budget officers blame incentives.

Incentives

The motivation to perform productively gets caught in the cross-currents produced by budgets. There are, first of all, incentives to misrepresent information in budgeting, thereby confusing the measurement problem further.^[5] Organization, program, and job survival become the ultimate goals when decision makers outside the organization threaten budget reallocations. The incentive for change and innovation has often come from making those inside the organization both responsible for and rewarded for reallocation.

Just as there are incentives to misrepresent, there are incentives to work in less than the most productive ways. Incentive pay is the best known antidote. The availability of funds and careful design of incentives for individuals is important. Group incentive plans are another variation. As reported by the U.S. General Accounting Office in 1983,^[6] for example, North Carolina state employees could propose programs for which they would be rewarded as a group, with a quarter of the savings, if greater productivity were realized. The state budget office chose those for which documentation might provide clear assessments of savings. Strong political support for such incentive programs must exist. In the North Carolina case, Lauth^[3] reported, the legislature terminated the program in less than 10 years because the program did less to reduce costs than it did to induce group incentives.

Budget-Friendly Productivity Elements

At another level, the productivity program can profit by major changes in the budget system. The budget system itself has been changed, in this case to one of two major systems, an expenditure control budget and a target base budget. Short of wholesale system change, retained savings plans remove the biggest disincentive to productivity improvement, the transfer of budget surpluses to the central treasury at the end of the fiscal year. Still short of a savings plan, calculating mechanisms may be added to budget systems. Finally, research on policy and program outcomes suggests that more effort in this direction may hold considerable promise.

First developed in California cities in the 1970s, expenditure control budgeting (ECB) has five elements, according to Herzik.^[7] First, the system relies on a base budget figure adjusted for population and prices level changes. Second, ECB base budgets assume existing service levels and require explicit approval of changes. Third, departments create retained savings plans, developed through productivity plan-induced savings, to finance changes in service levels or increases in programming. Fourth, central budget offices permit departments to carry forward savings realized in a fiscal year. Fifth, ECB relies on line item control of spending.

The most important aspects of ECB are selection of a base year and maintenance of department head interest in service delivery innovation. Base years may be different for agencies because, at any time, some have unique expenditures, such as capital projects, and others do not. Careful scrutiny prevents one department's base budget from being inflated, creating unfairness.

Second, a department normally having considerable political clout and able to gain bigger budgets to meet service demands may feel unfairly treated under ECB. Because all expansion must be paid out of savings, the department resists. Top management action to force attention to innovation consists of making the sole route to expansion the production of savings.

Target base budgeting^[8,9] relies on excellent revenue forecasting to establish a target. Given that accuracy, central budget offices allocate a target figure to departments within which existing service delivery costs must fit. New programs must pass muster separately in budget requests.

The existing services or target budget, even though revenue driven, force priority setting and often innovations. Rubin pointed out that the targets are assigned as a percentage of the base budget for a department. The targets "may be less than the department's base, by a percent that varies from year to year, and may vary from department to department."^[8] The target is protected, however, in that it is often an appropriated lump sum, with review of productivity or performance goals and not spending proposals, allowing various trade-offs and transfers within departments, between lines, between programs, and even between operating and capital budgets.

The unprotected or new budget requests to expand services to compete with those of other departments. The list of a department's projects is submitted in priority order. All lists get substantial scrutiny from budget examiners, Rubin stated. These lists force detailed scrutiny to the margin, making target base budgeting rational but not comprehensive.

Although ECB explicitly mandates retained savings and target base budgeting creates savings that may be reallocated, such savings plans may exist independently of a budget system. Klay^[10] reviewed these savings plans and described two types—conditional appropriations and discretionary savings plans.

Klay^[11] proposed that legislatures give state agencies direct incentives to innovate by appropriating the agency's funds in two parts—one unconditionally and the other conditionally. The legislature would authorize a part of an agency's program on the condition that the agency generate savings in its unconditionally appropriated program. If the agency is given appropriations for normal service delivery and the highest-priority program expansions in its unconditional appropriation, the legislature might also allow the agency to use savings on lower-priority expansions. The legislature might actually premise supplemental appropriations, especially when revenues are underestimated, on the generation of savings.

To retain some leverage over agencies, especially when the agencies that generate savings are not agencies that central budget offices or legislatures consider

to be well managed, finance officers might distribute savings, at their discretion, when productivity goals are met. Klay^[10] argued that also giving these same well-managed agencies their savings would provide substantial incentives. Discretionary savings plans might also be used in cases where several agencies competed in supplying essentially the same or similar services. Many pointed out the productivity potential of interagency competition, especially among agencies such as city governments, school boards, county governments, and independent districts, which perform some similar services. State oversight agencies, which have some control over the subnational governments, might retain discretion to reward those that produce the service most efficiently or that develop the greatest level of innovation. The ability to use retained savings might provide an incentive, and merger of service providers might aid in gaining effort toward either efficiency or innovation.

Ultimately, budget-friendly productivity elements must include outcome measures. Providing equitable incentives across agencies may instill a will to innovate, be efficient, or attain goals. Attitudes may portray the perceived needs of association members, organization customers, or agency clients. Allocation, however, demands an unbiased measure of achievement to which incentive programs may urge effort and against which attitudes may be viewed and balanced. To force budget-friendly performance decisions, therefore, there must exist outcome measures and a system to monitor work with these measures and evaluate performance itself.

Fisk^[12] warned of the difficulty in finding outcome measures and suggested three basic types of measures, operational, immediate, and consequential. Operational measures are those that describe the internal efficiency of an agency, including, for example, the number of reports produced, audits completed, and equipment downtime. Such measures help in the day-to-day management of an agency, but, strictly speaking, they are not productivity measures, as are immediate and consequential measures.

Immediate measurements are those that depict the final organizational output divided by the resources used to produce it or its inputs. For example, tons of garbage collected per employee hour provides a ratio, a technical efficiency measure. The shortcomings of these measures relates to their lack of power to explain why an organization collects garbage—is garbage collection a public health matter or a issue of aesthetics?—or how well we are doing it. Knowing that we are collecting garbage for public health reasons tells managers what priority to assign kinds of garbage and, therefore, where to go to collect it.

A consequential measure is one Fisk said that^[12] “addresses the issue of a program’s impact on society

and whether the program makes optimum use of resources to achieve its goals.” Knowing that an organization collects garbage to protect the health of the public can provide an avenue to explore, as above, the kinds of garbage to collect and where to go to collect the garbage. Other examples of consequential measures include deaths prevented per employee hour for a fire department and jobs created per employee hour for an economic development project. These measures directly relate organization members, customers, and clients to the organization’s work.

Although immediate and consequential measures form the bulk of traditional performance measurement in government agencies, relating them is an effort of more recent vintage. Swiss^[13] used the concept of “output chains” to show that budget-friendly productivity elements can be both valid and highly relevant to managers. That is, chains relate the question, “Did we perform the job without wasting resources?” to the other question, “Did the job achieve the desired result?” In our fire department example, we would establish first the number of fires fought (internal efficiency), then the cost per fire fought or fire fought per employee hour (immediate measures), and finally deaths prevented per fire or per employee hour (the number of reasonably foreseeable deaths without any fire action minus the actual number of deaths divided by the number of employee hours).

Finally, the measure of input used in immediate and consequential measures has traditionally been related to labor productivity. Labor costs dominate budgets, are relatively easy to calculate, are readily available in existing datasets, and have private sector data available for comparison. Simply, labor productivity reveals hours paid.

Because budgets, organization structures, and systems of work are based implicitly on output chains, making these chains explicit demands considerable work but relates technical efficiency measures based on labor productivity to immediate measures to consequential measures and then, most important, provides feedback. Feedback systems that use the outcome measures have budget consequences. Simply, the system should reveal the overall performance of a given program or organization and answer the questions raised about whether results are achieved.

What the measures emphasize may or may not jibe with the organization’s goals, with fairness, or with the budget’s emphasis. Consider lessons for social welfare entitlement programs learned from one past program initiative^[14,15] and the budgeting process connected with it. Measures were developed for overpayments and ineligible recipients. The system was monitored and state agencies administering the program sanctioned when their rates substantially exceeded federal standards. Yet, the system did not ferret out those

underpaid or those who were eligible but not receiving benefits. Truly, the organization's goals were minimized and unfairness increased, and the initiative forced displacement of the long-term economic goals of budget policy.

The initiative also splintered efforts to evaluate the program and guide its development in a budget-friendly way. First, the effort to evaluate the program went in two directions: one political to buttress the claim that the program had eliminated welfare cheats, and the other economic to justify the use of transfer payments to provide income floors—a safety net—for the young, the disabled, and the poor. Second, the initiative failed to guide budget-friendly productivity efforts. The initiative, as many who oppose it now look back and see, failed to discourage dependency. It did nothing to offer alternatives to transfer payments, more or less emphasizing greater spending in the future as transfer payment dependency reached future generations.^[16] Moreover, the initiative's implicit budget policy became cost centered. Cost-centered budgeting, generally, rewards projects that cost little, whatever their productivity value. Cost-centered budgeting leads eventually to zero-sum gaming where increased spending in one area means decreased spending in others and where deferred maintenance (keeping destitute or needy individuals whole) supports new projects.

CONCLUSION

A budget is a plan, a set of controls, a potentially large set of incentives, and a means of holding governments accountable for both what work is done and how much the work costs. Productivity and budgets would seem to be self-reinforcing and dynamic in encouraging innovation and performance. Many attempts have occurred over the years to change the format of the budget to make the conceptual linkage between productivity and budgeting stronger in practice. Many agree that these reforms succeeded in some ways, but failed to survive the politics of budgeting. Further, less ambitious efforts also exist to produce a politically acceptable connection. These efforts include approaches that lead budgeting to include productivity-friendly elements and ideas by change budgets to focus on productivity concerns.

Acquiring Resources through Price Negotiation: A Public Sector Approach

Rupert G. Rhodd

Department of Economics, Florida Atlantic University, Davie, Florida, U.S.A.

INTRODUCTION

Commercial negotiation has been with us for a long time, some accounts going as far back as when ships first sailed to China to buy silk and spices. In the pre-Industrial Revolution era the small scale of manufacturing operations meant that the entrepreneurs had to be skilled in everything including the purchasing of raw materials. If entrepreneurs were able to determine the quality of the inputs and, at the same time negotiate a price to minimize the average cost of inputs, the greater the demand for their product and the higher the profit margin. With the coming of the Industrial Revolution and large scale production there was a role for purchasing agents. In this period negotiation focusing on quality, delivery, and service “as industrial sellers customarily set prices at or near cost plus 10%.”^[1] The focus of negotiation shifted in the 1930s when sales people were granted the authority to set price at any level. Today, negotiation focuses solely on securing the best possible price.

For any organization, achieving long- and short-term goals and objectives depends on a host of economic relationships including the demand and supply of resources, which determine the price of resources. With increasing population and demand for government services, and with budgetary constraints, negotiating the optimal price and quantity of resources that are required to deliver government services has become an important activity of government agencies. This is recognized by the increased role and prominence of procurement departments/personnel in government agencies. Through negotiation, the purpose of these departments/personnel is “to secure the best possible long or short-term agreement for the organization, consistent with the concept of lowest total cost.”^[1]

Negotiation, as an important component of the organization’s strategy to acquire resources, can be considered a subtopic of game theory and can be analyzed using a similar approach as the broader topics of game theory. Alfred Chandler^[2] defines strategy as the determination of basic long-term goals and objectives, and the adoption of courses of action to achieve these goals.^[2] Strategy, which includes negotiation,

is important to the organization’s success, to the achieving of its long-term goals.

In a general way, a model of negotiation is an attempt to model in a specific way the interactions of competing utility or wealth maximizers, as it takes into account the strategies of competing players. Negotiation is therefore concerned with the analysis of strategic interaction in which the decision maker is assumed to interact with others in the environment, this causing the optimal decision to be affected by the action of others.^[3] Although it uses the same players found in any market (buyers and sellers), it extends the analysis through which price is determined by including actual interaction such as asymmetric information and haggling over the price. As in any game of strategy, there may be *cooperation* in which the players use contracts and are able to plan long-term strategies. In other situations there could be *non-cooperation* especially if enforcing the contract is difficult.

A model of negotiation could be included under the broader topic of “game theory” in which payoff functions and strategy sets are assigned to the participants, and the various outcomes are noted when particular strategies are chosen to maximize the payoff. “Game theory is concerned with the actions of individuals who are conscious that their actions affect each other.”^[4] Game theory is used mostly in situations where private decision makers are seeking to maximize wealth in the marketplace, not in situations where purchases are made by government agencies as they are not assumed to be “maximizers” of wealth or profit. However, because purchases by government agencies include contracts, are budget restricted, take place under various forms of competition, and oftentimes include some haggling, there is scope for analyzing government procurement through some form of game theoretic model using similar assumptions. The analysis presented below will not be a “pure form of game theory.” It will seek to specify conditions under which government procurement takes place and theorize as to where the final price will settle; closer to the seller’s offering or closer to the buyer’s suggestion.

VERTICAL INTEGRATION VS. OUTSOURCING

Vertical Integration

Public and private firms, seeking to acquire goods, generally do so through vertical integration or outsourcing. Whereas a vertical chain of production is the coming together of firms at various stages in the production of a good, outsourcing is that situation in which a firm gets an input to deliver a good or service, or the firm acquires the good or service to be delivered from an external source. With vertical integration, benefits such as: 1) reduction in transaction and coordination costs; 2) continuity of supply; 3) the non-sharing of proprietary rights; and 4) greater control over the quality of inputs are often realized.

Organizing production through vertical integration means that firms are organized into a business unit. The implication from this is that measuring the performance of individual firms requires that a “transfer price” be established for goods and services exchanged. With a transfer price, total profits can be reallocated among firms in the business unit and this could impact the business unit’s overall profit. Supplying goods through vertical integration may therefore not encourage least cost production by an individual firm because of subsidies by more profitable firms within the integrated business unit.

Transfer of goods between firms in a vertically integrated business unit can take place as follows. If there is a competitive external market for the good in question, the product can be transferred at the “external market price.” If there is no external market or if for some reason the market price does not truly measure the opportunity cost of producing the good, the “marginal production cost” could be used to determine the transfer price. With the marginal production cost being the cost to produce the last unit, this therefore represents the value of resources foregone to produce the last unit. Some firms in an integrated unit have also made use of “full-cost transfer prices” because it is felt that marginal cost of production focuses on variable cost and omits fixed cost.^a This method is simple, is easily implemented, and is the most popular of the pricing mechanism used by firms in an integrated unit.^[3]

Price negotiation can assist in the transfer of goods between firms in an integrated unit and also in the acquisition of goods through outsourcing. In an integrated unit, the price at which goods are transferred is aptly labeled the “negotiated transfer price” because it is determined by negotiation between the units.

A negotiated price between firms in a business unit is expected to maximize the combined profits of the negotiating firms. The selling firm will not negotiate a price below its production cost, and the acquiring firm will not pay a price above that for which it can buy the product elsewhere. The reference to purchasing a good at a price not higher than that for which it can be purchased elsewhere indicates that the market does play an indirect role, and serves more as a reference point for the determination of a negotiated transfer price. Because it is possible for two firms in an integrated unit to negotiate a transfer price without at the same time agreeing on the quantity to be transferred at that price, there is no guarantee that the negotiated price will maximize the business unit’s value. There is also the possibility of a long, drawn-out, and time-consuming process which when converted to a monetary value could increase the cost of acquiring goods and services.

Outsourcing

For the public sector in the United States, goods and services are acquired mostly through outsourcing, which is generally defined as obtaining goods and services from outside rather than providing them in-house. There are many possible reasons why the public sector may have decided to acquire goods and services through outsourcing. Among them are: 1) heightened competition between supply firms and the relatively low cost of goods and services; 2) flexible production techniques and the willingness of producers to satisfy government needs; 3) the short tenure of government and the disruption that would be caused when the leadership/ruling party changes; and 4) improved communications and the relative ease with which goods and services can be obtained from outside agencies.

When firms seek to acquire goods and services through outsourcing, the cost of goods and services are determined by market conditions, or the price is determined through negotiation, especially where there are long-term contracts.^b Buying goods in the competitive market could be advantageous as compared to a non-competitive or negotiated situation because it could easily be argued that as competitive firms do not make surplus profit over the long-run period, the market-determined price tends to be lower than a negotiated price. However, even with the potential benefits from acquiring goods at market price, procurement officers in the public sector have used negotiation with long-term contracts and a few vendors to

^aWhereas variable costs (e.g., direct labor costs and commissions to salespeople) increase with output, fixed costs (e.g., lease agreement and administrative expenses) remain constant when output increases.

^bLong-term contracts could be in the form of long-term supply and distribution contracts, franchise contracts, leasing contracts, or strategic alliances.

acquire goods and services. There seems to be the feeling that through negotiation there is more control over price, quality, and delivery. Although this may be true for quality and delivery, the negotiated price is more dependent on the skillfulness of the parties “at the negotiating table” and conditions in the market.

GOVERNMENT PROCUREMENT AND MARKET CONDITIONS

Negotiation in general differs from a ball game or a war where only one side wins and the other side loses. In successful negotiations, both sides win something, giving rise to a “win-win” situation. When procurement officers or purchasing agents seek to acquire goods and services through negotiation, the objectives of negotiation are: 1) to obtain the quality specified; 2) to obtain a fair and reasonable price; and 3) to get the vendor to perform the contract on time. Although all three objectives are important, budgetary restrictions on public sector agencies cause most attention to be paid to obtaining goods and services at a fair and reasonable price. Mention is often made of securing goods and services at the “right price,” that which is fair to both buyer and seller.^[5] And even with this definition, the “right price” is not static because firms are able (within limits) to adjust their asking and offering price, which could vary with market conditions.

In the United States we find the three forms of competition that are discussed in any elementary microeconomics textbook. At one extreme, there is the idealist form of perfect competition characterized by “atomistic” competition in which a large number of sellers trade a homogeneous good. This form of competition is also characterized by the availability of low cost of accurate information and the ability of firms to freely enter and leave the industry.

At the other extreme of the competitive spectrum is monopoly, where one firm controls the supply and hence the price of the product. Some reasons for the establishment of monopolies include the control of specific assets, production requiring large output and the realization of economies of scale, the availability of excess capacity and the ability to increase production at will, pre-commitment contracts, licenses and patents, and pioneering brand advantages.

Between the two extremes are conditions of imperfect competition where the number of sellers of a heterogeneous or homogenous good can be large or small. Under this market form, the supplier has some control over “brand” price. Studies have shown that in the United States, most goods are traded under conditions where there is some freedom to adjust price,

and this would imply conditions of imperfect competition.^c We accept the conclusions of these studies as true, but we also believe that tightly budgeted expenditures and the encumbering of funds for future expenditure cause the government sector to secure goods under varying conditions of competition. To get the biggest “bang for the buck,” government procurement is forced into markets where the price will be “right” or most beneficial to the agency.

Pricing of Goods

One of the tips given for conducting successful negotiation is “do your homework.” For government agents, this includes knowledge of the product and market. Regarding the procurement of goods, one would be more inclined to believe that if quality and quantity are easily ascertained, pricing issues involving government procurement would be at a minimum. If this is so, the situation boils down to whether pricing should be based on full cost, marginal cost, or some method to benefit the government agency as well as the firm supplying the good.

In the most competitive market, substitute goods are differentiated by design, wrapping, or other such features. The market has a large number of sellers with the individual seller forced to sell at “near equal” prices. Furthermore, to remain in this market, suppliers must be very efficient. We could therefore infer from this that suppliers in this market will sell to government agencies at the lowest possible price, that the goods will be of the highest value, and that price is a true indicator of quality. Furthermore, if government procurement involves “large dollars” and contracts that can cover multiple years, firms selling to government agencies will endeavor to have a long relationship with the agencies by selling at a lower price. Based on the above, government procurement agents seem to have some amount of buying power.

Intense competition forces manufacturers to make their products intrinsically different. This gives room for different negotiated prices between suppliers and the government, and components such as service and delivery are included in the price. Also, as the number of producers/sellers in the market declines, suppliers will have more power over the price at which goods are purchased. It also follows that as the products become more differentiated, more effort will be required by government agencies to determine quality and similarity of prices. If procurement personnel is limited, government agencies could be forced to accept

^cSee Ref.^[5], p. 244, for a list of these studies.

the seller's words, with the negotiated price more beneficial to the seller.

If the government seeks to buy goods from traditional sellers, procurement agents could find themselves involved in a game. This is because traditional sellers see negotiation as a game in which they offer to sell their products at a very high price, expecting the buyer to counter at a very low price. Through haggling and counter-offers, the established price is set somewhere in between the seller's high price and the buyer's lower price. If the government procurement official is expecting this response, both buyer and seller will be using various means (tricks, creative lies, and artful badgering) to negotiate in their favor. This could compromise delivery, quality, and goodwill.

Pricing of Services

Research indicates that employee's compensation as a percentage of non-capital direct expenditure is between 30% and 40% at the state and local levels, and 15% and 20% at the federal level.^[6] Economic theory proposes that labor should be paid according to its marginal revenue product, which is the marginal product of labor expressed in dollar value. This approach is only useful in the public sector where the output of labor is easily determined and where the government can determine the quality of the output. If quality and quantity are not easily determined, there is room for a negotiated wage rate. Many factors can determine the negotiated wages, these including union representation, skills of labor, demand by the public sector, and wage rate in other sectors of the economy.

There is also the additional issue of what price should the government pay labor when productivity of labor and wages in the other sectors of the economy increase faster than in the public sector. This issue is important because depending on the policy chosen, the supply of labor in the public sector could decline, efficiency could fall, and the average cost of services in the public sector could increase. Here again, negotiations are important. To reduce the above problems, the negotiated price of labor should be close to that which is offered in the more efficient private sector. Furthermore, because jobs in the public sector tend to be more secure and with the likelihood of more generous benefits, paying labor a rate close to that paid in the more efficient private sector could attract labor from the

private sector and improve the efficiency of labor in the public sector.

Even with the analysis outlined above, we understand that each procurement project is unique and complex and thus defies the use of a general rule or policy. We also believe that for each purchasing organization, the regulations, and the rules are different. These complicate the procurement process. In the end, the procurement approach that is used and the manner in which it is implemented will determine the success or failure of government's projects. Because of the dynamic nature of today's market, it is imperative that government agencies continue their vigilance on procurement procedures.

CONCLUSION

With the increasing size of government spending, and with more pressure on the public sector to provide a wider range of goods and services, negotiating the "best" price for the highest quality of goods and services is of greatest importance. To facilitate this process, government procurement officials must be well trained in negotiation, business decision-making, and economics and their departments must be adequately equipped with the latest technology to seek out suppliers. In the long run, a more informed procurement division will go far in maximizing society's benefits from public expenditure.

INTRODUCTION

This article is meant to provide the reader with a general understanding of activity-based costing (ABC), and its uses and benefits in the public sector. Some of the limitations of ABC are also covered.

ABC is designed to provide information for strategic decisions. Applying this model to the public sector, ABC can provide information on the cost of providing government services for strategic decisions, such as determining the affordability of providing discretionary government services (e.g., picking up yard waste); setting user fees, both internally between agencies and externally, for billable government services (e.g., water and waste water services); and determining whether to outsource government services (e.g., trash pickup).

Activity-based management (ABM) takes the ABC model to the next logical step, providing information for operational decisions (i.e., for cost management aimed at improving day-to-day operations). For example, instead of outsourcing trash pickup, the governmental entity might use the activity-based information to improve the government operation to the point where it is competitive with the private sector. The combined use of ABC and ABM is so common that many writers refer to the combined models as one—ABCM (activity-based cost management).

Activity-based budgeting (ABB) takes the model to its third logical step. Once the organization knows the cost of providing various services, it can budget the level of services it wants to provide and determine the amount of resources required to provide that level of services. Given scarce resources, the level of services is likely to exceed the available resources, even after additional sources of funds have been considered. Reductions of funds can then be logically tied to reductions of particular services. For example, if recycling pickup costs \$2 per house per pickup, the cost savings of reducing pickups from once per week to once every two weeks can be determined. Viewed from the opposite angle, the effect of cutting resources available

for recycling pickup in half on the frequency of pickups can be more clearly determined.

ADVANTAGES OF ABC

Activity-based costing has several advantages:

1. It provides understandable information—people intuitively understand activities, and how activities consume resources and raise the cost of cost objects.
2. It reduces arbitrary cost allocations by charging resources to the activities that consume them and charging activities to the cost objects that consume them, where possible.
3. It identifies activities that highlight departmental interdependencies, which can reduce functional suboptimization.
4. It provides cost driver information for managers and employees to remove costs on existing services or avoid costs on new services.
5. It provides data for other improvement initiatives (e.g., total quality management).
6. It improves budgeting by tying the budget to the actual work that is done.

CAVEATS REGARDING ABC

Activity-based costing is not a panacea; ABC models tend to address cost only, at a strategic level too general to satisfy operational needs. Operational improvement information comes from the addition of ABM and requires the addition of non-cost performance measures to the model.

Even ABCM does not lead to improvements. People must use the data to make improvements. If the ABC system indicates that governmental trash pickup is more costly than the private sector, it will continue to be more costly unless the governmental garbage

entity uses ABM information to reduce the cost of providing that service.

Activity-based costing, ABM, and ABB are not one-time efforts, which is another way of saying that they are costly in terms of time and money. If ABC indicates that the cost of providing a service is too high and that service is reengineered to be less costly, then a new ABC model needs to be constructed to determine the new cost of providing that service.

Finally, there are problems caused by generally accepted accounting principles (GAAP). Under GAAP, a cost incurred in 1 year, but related to several years, may be expensed in the year incurred. For example, a major training program for newly installed software may be expensed when incurred, making it less likely to be reflected in the cost of future activities that benefited from the training. Conversely, a cost delayed, such as maintenance, will not be reflected in the accounting records until incurred, making it unlikely to be reflected in the current activities that benefited from the use of the asset.

MODEL AND TERMINOLOGY

The CAM-I Cross

To understand ABC systems, it is instructive to examine the CAM-I Cross. The vertical portion of the cross, the cost assignment view, is ABC, whereas the horizontal portion, the process view, is ABM (Fig. 1).

As the cost assignment view shows, resources are consumed by activities and activities are consumed by cost objects. From another perspective, cost objects require the performance of certain activities, and those activities require the use of certain resources. Each part is discussed in turn.

Activities (Tasks and Processes)

Activities are at the center of ABC. They are a series of tasks (work steps) performed by an organization yielding a useful aggregation. To be useful, the aggregation needs to be neither too broad nor too narrow. For example, “provide unemployment benefits” would probably be too broad. Such aggregations of activities are called processes. “Hand blank benefits form to next person in line” would be too narrow. Such narrow parts of activities are called tasks or work steps. “Process unemployment-benefits application,” “authorize benefits payment,” and “issue benefits check” might be proper aggregations.

Because activities represent work done by the organization, they should be defined by an action verb followed by a noun, with an adjective in the middle optional. Where only one type of application is processed (or where every application processed requires the same level of resources), “process application” is an understandable activity name. Where different applications are processed, more descriptive names such as “process unemployment-benefits application” are warranted.

There are various ways to identify activities (e.g., storyboarding and activity dictionaries) but their discussion is beyond the scope of this article.

Resources

Resources are economic elements used by an organization (e.g., labor, equipment, utilities). Although the model refers to resources, the cost of resources is what appears in the model. So, while labor is a resource consumed by activities, the salaries, which represent the cost of the labor, are reflected in the ABC computations.

Fig. 1 The CAM-I Cross. (© 1990 CAM-I. Used with permission.)

To process unemployment benefits applications, the entity will use resources such as labor, equipment, utilities, and office supplies. The cost of these resources can be found in the accounting records and needs to be charged to the activity that consumed the resources.

Cost Objects

Cost objects are the reason that organizations perform activities. They are simply objects for which management desires a cost. Examples include products, customers (individual recipients of benefits or selected groups of benefit recipients, such as laid-off workers from a particular employer), and services.

Cost objects cause activities (e.g., provision of unemployment benefits requires the provider to process unemployment-benefits applications, authorize benefits payment, and issue benefits checks). The activities caused by a particular cost object should be charged to that cost object.

Resource Drivers

Resource drivers are used to charge the cost of resources to activities. In some cases, a resource is used for only one activity, and therefore, can be traced to the activity. If employees spend 100% of their time processing unemployment-benefits applications, then the employees' salaries can be charged in total to that activity. However, cost assignment (allocation) becomes necessary when employees spend time on multiple activities.

Resource drivers (first-stage drivers) are used to assign resource costs to activities. They represent a measure of the quantity of resources consumed by an activity. As examples, 1) labor and fringe benefits of an employee can be assigned based on the percentage of time the employee spends "processing unemployment-benefits application" and "authorizing benefits payment," and 2) equipment rent or depreciation can be assigned based on the percentage of time the equipment is used for different activities.

There are various ways to identify resource drivers (e.g., labor logs, questionnaires, interviews of employees and supervisors, observation, physical measurement for items like square footage) but their discussion is beyond the scope of this article.

Activity Drivers

Activity drivers (second-stage drivers) are factors that are used to assign activity costs to cost objects. They represent a measure of the quantity of activity cost consumed by the cost object. There should be a

cause-and-effect relationship with the cost driver. For example, assume that we are processing unemployment benefits for two companies, Company X and Company Y, and we want to assign the cost of this processing to each company. In this case, the activity driver might be "number of claims processed." If we process twice as many claims for Company X as Company Y, then twice as much cost for this activity should be charged to Company X.

Activity drivers exist at various levels: unit, batch, product or service, customer, facility, and organization sustaining are common categories.

Cost Drivers

Cost drivers are the root causes of costs. Identifying cost drivers can help an organization to improve processes or reduce costs by eliminating or reducing the non-value-added activities and by performing value-added activities more efficiently.

Again, consider the processing of unemployment claims. Assume that the agency has a policy that requires a supervisor to review each unemployment-benefits application that is processed, before payments can be made. The policy requiring the supervisor to look at each processed claim would be a cost driver. The related work step or task—the supervisor actually reviewing each claim—would be included in the activity "authorize benefits payment." By eliminating this policy, the cost of performing this activity would be reduced. Another cost driver of both "process unemployment-benefits application" and "authorize benefits payment" is the design of the unemployment-benefits application. A poorly designed document will increase the time required to input/review the information and increase the likelihood of errors, thereby increasing the processing and authorization costs. Redesigning a problematic claim form can reduce the cost of these activities.

There are multiple cost drivers associated with most activities. The cost of the activity "process unemployment-benefits application" is driven by many factors, including the number of claims processed, the completeness of the information supplied by the claimant, the training and experience of the agency employees processing the documents, the design of the form, and the time of day when processing occurs. The identification of significant cost drivers is critical to ABM.

As a final note, cost driver is not a synonym for activity driver. There is only one activity driver for a particular activity, but there are multiple cost drivers. In the case of "process unemployment-benefits application," one of the cost drivers—the number of claims processed—is likely to be used as the activity driver.

Table 1 Estimated overhead costs using record-keeping categories

Overhead only	Estimated cost
Salaries	\$150,000
Fringe benefits	30,000
Building rent	70,000
Building utilities	10,000
Small tools and supplies	15,000
Equipment depreciation	160,000
Equipment insurance	3,000
Equipment maintenance	17,000
Gasoline	45,000
Total	\$500,000

There are even situations where the chosen activity driver is not one of the cost drivers. If one remembers that cost drivers are what causes cost to appear in the activity cost pool, whereas activity drivers are a measure of the consumption of the activity cost pool by cost objects, the difference between the two types of drivers is understandable.

Performance Measures

Performance measures determine how effective an organization is at performing activities. These measures describe how effective the organization is at performing the work (the activities) in the organization, along with an indication of whether the activities that are being performed meet the needs of the organization's internal and external customers. Performance measures can be either financial or non-financial in nature. There are four categories of performance measures: time, quality, cost, and productivity.

An organization that processes unemployment claims might be interested in the "number of claims processed per hour" (a performance measure that is measuring time), the "number of claims that were error free" (a performance measure that is measuring quality), "the cost per claim filed" (a performance measure that is measuring cost), or "total number of claims filed

Table 2 Traditional cost allocation

Traditional cost allocation	Picking up leaves (4 DLH)	Cutting trees (5 DLH)
Direct labor (@ \$7 per DLH)	\$28	\$35
Service overhead (@ \$227 per DLH)	908	1,135
Totals per pickup/cutting	\$936	\$1,170

Table 3 ABC overhead activities

ABC overhead activities	Estimated costs
Schedule pickups/cuts	\$40,000
Set up equipment (for pickups/cuts)	100,000
Drive routes (and pickups/cuts)	270,000
Dispose of leaves and branches	50,000
Total	\$460,000

during the week" (a performance measure that is measuring productivity).

Also note that performance measures for one group can be cost drivers for another. Take the use of "number of claims that were error free" as a performance measure for the activity "process unemployment-benefits application." Errors in processing applications increase the cost of the subsequent activity—"authorize benefits payment"—because such errors require correction before authorization can occur. They can also decrease the performance of the "authorize benefits payment" activity because they decrease the number of authorizations that can be completed in a given amount of time. In other words, errors in "process unemployment-benefits application" are a cost driver for the downstream activities.

EXAMPLE

The following example helps to clarify the discussion.

The City of Kendallville performs two lawn services for its taxpayers. It picks up leaves after residents rake them into the street, and it cuts the branches of trees that are close to street signs and power lines. Except for a few smaller items, the same equipment is used for both services. Picking up leaves is done three times per year, whereas cutting trees is done twice per year.

Kendallville is divided into 100 neighborhoods. Thus, picking up leaves is done 300 times and cutting

Table 4 Activity data

ABC overhead activities	Picking up leaves	Cutting trees	Total
Schedule pickups/cuts ^a	30	100	130
Set up equipment (for pickups/cuts) ^b	5	80	85
Drive routes (and pickups/cuts) ^c	35,000	30,000	65,000
Dispose of leaves and branches ^d	50,000	100,000	150,000

^aNumber of trips scheduled.

^bNumber of setups.

^cNumber of miles driven.

^dPounds dumped.

Table 5 Overhead rates per unit of activity

Activity	Estimated overhead cost/ Estimated total activity	Overhead per activity
Schedule pickups/cuts	\$40,000/130 trips	\$307.69 per trip
Set up equipment (for pickups/cuts)	\$100,000/85 setups	\$1,176.47 pre setup
Drive routes (and pickups/cuts)	\$270,000/65,000 miles	\$4.15 per mile
Dispose of leaves and branches	\$50,000/150,000 pounds	\$0.33 per pound

trees is done 200 times. For each neighborhood, it takes 4 hours to pick up the leaves of the residents, and 5 hours to cut the branches. The city currently has a traditional cost system in which direct labor hours are used to assign overhead cost to these two services.

Table 1 shows the estimated overhead using record-keeping categories.

The predetermined overhead rate of \$227 per direct labor hour is determined by dividing the budgeted overhead cost of \$500,000 by the budgeted 2200 direct labor hours. (The budgeted direct labor hours represent 300 occurrences of picking up leaves times 4 hours per neighborhood plus 200 occurrences of cutting trees times 5 hours per neighborhood.)

Table 2 shows the cost of each service for one neighborhood.

The City of Kendallville is considering the implementation of an ABC system to cost these two services. The city manager has collected the following information.

First, the city determined that, of the \$500,000 in service overhead, \$10,000 of the small tools and supplies represents saw blades and such, which can be directly traced to cutting trees. In addition, \$30,000 of the salaries represents payments to an external consultant who reviews the neighborhoods and determines where tree cutting will be necessary. This \$40,000 will

be directly traced to the tree-cutting cost object (\$40,000/200 cuttings = \$200 per cutting), whereas the remaining \$560,000 will be assigned (allocated) using ABC.

Table 3 presents the activities were determined to be the cause of the remaining \$460,000 in overhead costs. Table 4 presents estimated activity data.

The following activity data was estimated (Table 4).

Because picking up leaves is determined by the seasons, scheduling of 10 neighborhoods at one time is possible. So, 300 pickups need only 30 trips scheduled. Also, because the pickups occur close together in time, few equipment changeovers are required between pickups. Tree cutting, however, is not restricted by the seasons and is done in small batches of neighborhoods, as need is identified by an external consultant.

Table 5 displays the overhead rates computed for each specific activity. With these overhead rates, Table 6 presents the assignment of overhead to services. The assigned overhead is then used to compute the service cost using ABC (Table 7).

In this example, the ABC rates of \$618 per pickup and \$1647 per cutting indicate that the traditional system rates of \$936 and \$1170, respectively, are overcosting the leaf removal service and undercosting the tree-cutting service. This information would be useful if, for example, the local utility reimburses the city for much of the tree-cutting service.

Table 6 Assigning overhead to services

Activity	Picking up leaves		Cutting trees	
Schedule pickups/cuts	30 trips × \$307.69 per trip	\$9,231	100 trips × \$307.69 per trip	\$30,769
Set up equipment (for pickups/cuts)	5 setups × \$1,176.47 per setup	5,882	80 setups × \$1,176.47 per setup	94,118
Drive routes (and pickups/cuts)	35,000 miles driven × \$4.15 per mile	145,250	30,000 miles driven × \$4.15 per mile	124,500
Dispose of leaves and branches	50,000 pounds disposed of × \$0.33 per pound	16,500	100,000 pounds disposed of × \$0.33 per pound	33,000
Totals (assigned \$459,250, instead of \$460,000 due to rounding)		\$176,863		\$282,387
Service overhead per pickup/cutting	\$176,863/300 pickups	\$590	\$282,387/200 cuttings	\$1,412

Table 7 ABC cost allocation

ABC cost allocation	Picking up leaves (4 DLH)	Cutting trees (5 DLH)
Direct labor (same as traditional above)	\$28	\$35
Directly traced service overhead (computed earlier)		200
Service overhead per pickup/cutting	590	1,412
Totals	\$618	\$1,647

CONCLUSION

With activity-based costing information, a public entity can make strategic decisions regarding what discretionary government services to offer, what user fees to charge internally as well as to consumers for billable government services, and whether to in source or out source public services. With the addition of activity-based management, the governmental entity can make decisions involving the management of its costs that will improve the efficiency of its operations. Finally, with the addition of activity-based budgeting, the public entity can determine which services it can afford to provide to members of the community based on available resources, and how much it can save from curtailing various services in times of scarcity.

Administration of State Lotteries

Jeff Leon Dense

*Department of Political Science, Eastern Oregon University,
La Grande, Oregon, U.S.A.*

INTRODUCTION

The most common form of legalized gambling in the U.S.A. are state lotteries. Forty states and the District of Columbia currently operate lotteries. From their humble beginnings in New Hampshire in 1964, lotteries have developed into a primary revenue source for a number of state governments, generating over \$48 billion in sales during the fiscal year 2004. More importantly, after accounting for prize distribution and administrative expenses, lotteries generated over \$15 billion in profits.^[1] State lotteries have assumed a prominent, albeit often misunderstood, role within public finance and American culture.

A series of structural developments contributed to the states jumping on the lottery bandwagon. Citizen resistance to additional taxation, the Reagan era devolution of government known as "New Federalism," and the existence of lottery operations in contiguous states, served as rationales underlying lottery adoption. Driven by the imperative of revenue maximization, a range of administrative practices, including product portfolio strategies, retailer commissions, operational efficiency, and joint ventures with other lotteries have a direct effect on a lottery's "bottom line." The proliferation of Native American and commercial casinos has supposedly created another weighty fiscal challenge. An appraisal of administrative practices and their subsequent impact on public finance, underscores the problems and prospects confronting state lotteries.

LOTTERY PRODUCT PORTFOLIO

One of the fundamental marketing decisions confronting lottery officials is which products should be offered to the public. A series of structural characteristics impinge on lottery performance and the amount of revenue the lottery is able to generate. While the payout rate for most lottery games hovers around 50%, lottery officials can manipulate several factors, including the frequency of the opportunity to gamble and the range of stakes associated with a particular game, in an attempt to maximize sales and ultimately revenues. Each lottery product has its own unique set of structural characteristics that, in tandem with other lottery

administrative practices, have the potential to provide a significant stream of revenue to state coffers.

Instant scratch-off tickets are a staple of all lottery product portfolios. Given their low technological requirements, instant tickets are especially attractive to newly created lotteries. Thematic games (e.g., Happy Holidays and Pan for Gold) and their simulated play value keep the player in suspense as long as possible, adding to their allure. It is common for lotteries to simultaneously operate a number of instant scratch-off ticket games. Instant tickets account for approximately 50% of traditional lottery sales.

Daily numbers games are a remnant of the illegal numbers games that were a longtime fixture of many urban neighborhoods in the U.S.A. The vast majority of state lotteries offer three and four digit numbers games on a daily basis. A popular variant of the daily numbers game is Lotto, which requires a player to match six numbers from a field ranging from 49 to 54. If no player correctly selects all numbers, the grand prize is rolled over to the next drawing. This rollover feature can lead to multimillion-dollar jackpots and a spate of free publicity for the lottery. A third variant of the daily numbers game is Keno, based on the casino game of the same name. Keno allows the player to choose a number of numbers from a range of 80. Keno is currently offered by 11 states.

One of the most important game portfolio selection decisions is whether to adopt Video Lottery Terminals (VLTs). Similar to slot machines, VLTs are far more similar to casino gaming products than those traditionally offered by state lotteries. The ownership of VLTs differs by jurisdiction, ranging from private sector and technology provider, to government ownership. Despite the relatively low odds of winning, the opportunity to immediately reinvest the winnings and the fast-paced action has permitted VLTs to assume a primary role in lottery revenue generation.

STRUCTURAL CHARACTERISTICS

Of all the structural characteristics of lottery products, the most important from the revenue maximization perspective is the frequency of opportunity to gamble. A skilled VLT player can play approximately 15 games

a minute in comparison with fast-draw Keno (five minutes) and bi-weekly Lotto drawings. However, state lottery officials are able to maximize revenues from more static game offerings like Instant Scratch-Off Games by altering the cost of participating in these games. While all states offer \$1 Instant tickets, there has been a recent trend toward introducing higher priced Instant tickets. Nearly all lotteries currently offer a \$10 Instant game, and eight states have begun offering \$20 tickets. While the jackpot for these higher priced Instant games is higher than their lower priced brethren, it should be noted that none of the states offering \$20 dollar Instant tickets has decided to legalize VLTs.

While Lotto and Daily Numbers games have lingered with their traditional \$1 cost, it is conceivable that given the increased competition for the gambling dollar, the cost of participating in traditional lottery games will rise in the future. There is a multiplicity of price-point strategies for lottery administrators to contemplate as they manipulate their product portfolio.

RETAILER COMMISSIONS

States employ a range of compensation schemes to reward retailers, vendors, and game operators, which have an intrinsic effect on the lottery's "bottom line." In an effort to maximize profitability, lottery officials must develop an easily accessible network of retailers to provide their products to the public. While virtually any business in the U.S.A. is eligible to sell lottery products, convenience stores and grocery stores account

for nearly three-quarters of all lottery sales. However, this retail service is not provided free of charge. The typical sales commission paid ranges from 5% to 7%. Moreover, the majority of state lotteries provide a cashing bonus to sellers who redeem winning tickets, usually 1%, providing an additional incentive for retail outlets to sell lottery products.

While there is a relatively standard formula for compensating retailers of traditional lottery products, there is wide variability in the structure of compensation for VLT operators (Table 1).

With the exception of Oregon, VLTs are operated by third parties, who are able to extract a high percentage of net sales for their services, in excess of 25% in each VLT-operating state.^[2] Increased sales should logically lead to increased profits. However, the inefficient nature of lottery operations, especially VLTs and their exorbitant commission structure, should give public officials pause as they attempt to maximize profits while providing a modicum of administrative oversight.

OPERATIONAL EFFICIENCY

While prizes paid to players provide the impetus for the public to participate, the high cost of retailer commissions and administrative expenses impede the lottery's ability to maximize revenue to government coffers and good causes like senior citizen programs, parks and recreation, and education. There are a variety of measures that can be utilized to assess the operational efficiency of state lotteries, including cents spent to generate a dollar of revenue, percentage of

Table 1 Video lottery terminal operator compensation rates

Jurisdiction	Retailer compensation percentage	Ownership and operation
Delaware	49%	Third party operators
Iowa	80%	Retailer
Louisiana	Bars and restaurants: 74% Racetracks/Off track betting: 77.5% Truck stops: 67.5%	Third party operator or retailer
Montana	85%	Third party operator or retailer
Oregon	Sliding scale, minimum of 20%	State lottery
New York	29%	Third party operator
Rhode Island	Racetrack: 27% Jai Alai: 26%	Third party operator
South Dakota	50%	Third party operator or retailer
West Virginia-Limited Video Lottery Terminal Program	57%	Third party operator or retailer
West Virginia-racetracks	43%	Retailer

(From Ref.^[2])

personal income spent on lottery products, and administrative costs as a percentage of net lottery profits (Table 2).

However, these statistical measures fail to accurately portray the cost of lottery operation to the general public. Instead, per capita administrative expenses provide a clear picture of the cost of lottery operation to the playing, and nonplaying, public. The evidence suggests that the high cost of administering traditional lottery products impedes the efficient operation of state lotteries and, ultimately, their ability to maximize revenues.

JOINT VENTURES

State lotteries have attempted to create economies of scale, and moreover, increase sales by offering games in concert with other lotteries. The most popular of these games are Powerball, played in 27 states, and Mega Millions, played in 12 states. No state offers both these games. Multimillion dollar jackpots allure the public to play these games, with jackpots in excess of \$100 million common. These games have aided lottery administrators in ensuring that a drawing for a lottery product is held daily, with drawings for

multistate games alternating with those offered by each state. The high odds of winning the grand prize (Powerball = 1:120,526,770 and Mega Millions = 1:175,711,536) mark these as the quintessential “bad bet.” However, the administration of these products is relatively efficient in comparison with other traditional lottery products, and quite profitable for those states that decide to participate in these multistate lottery games.

COMPETITION FOR THE GAMBLING DOLLAR

State lotteries once reigned supreme over the American gambling landscape. Lottery officials contend that the increased competition for the gambling dollar from Native American gaming, riverboat casinos, and Internet gambling will erode the market for state lotteries, leading to an adverse effect on public finance. Hence, public officials are never quick to embrace new forms of gambling activity that they perceive may minimize the fiscal benefits lotteries provide to state government.

One of the fundamental gaming policy issues confronting state governments is the potential effect of substitution and saturation on the state's lottery. Substitution refers to the diversion of spending on one type

Table 2 Per capita lottery operational expenses, 2004

State	Per capita expense (\$)	State	Per capita expense (\$)
District of Columbia	82.35	Indiana	16.04
Wisconsin	55.22	Texas	15.89
Massachusetts	50.07	Missouri	15.68
Rhode Island	35.25	New Mexico	14.60
Georgia	33.02	Idaho	14.58
New York	30.09	Iowa	13.75
South Carolina	26.29	Colorado	13.47
Maryland	25.70	Illinois	13.46
Connecticut	25.05	Kansas	12.43
Vermont	23.72	Minnesota	11.99
Michigan	23.04	Nebraska	11.82
Kentucky	22.47	Louisiana	10.88
New Jersey	22.31	Montana	10.74
Maine	21.90	Washington	10.70
New Hampshire	21.84	California	10.33
Delaware	21.19	Arizona	10.17
Ohio	20.11	South Dakota	9.45
Pennsylvania	19.93	Tennessee	8.97
Virginia	18.60	West Virginia	4.78
Florida	17.85	North Dakota	2.50
Oregon	16.62	Average	20.61

(From Ref.^[1].)

of gaming activity to another form of gaming. The related concept of saturation suggests that all consumer products, including gaming products, follow a product life cycle with four phases: introduction, growth, maturity, and decline. Saturation refers to a situation where sales of a lottery product, or wagering on a particular form of gaming, peak or flatten.

Evidence indicates that the introduction of commercial casinos has had a negligible impact on lottery sales and lottery-generated revenue.^[3] This finding has strident implications on the fiscal future of cash-strapped state governments throughout the U.S.A. who are contemplating an expansion of gaming activity. The reality is that there is far more substitution among lottery products than there is between lotteries and casinos. For example, the addition of a multistate lotto style game has a negative effect on sales of existing lotto games.

Given the “bottom line” orientation of state government officials, it is reasonable to infer that decision makers will argue that the proliferation of gambling is in the public interest when new forms of gambling activity provide an increase in revenues to state coffers. In every one of the nine states with commercial casinos and a state lottery, total gaming revenue (i.e., the sum of lottery and casino revenues accruing to the state) has increased since the introduction of casino gaming (Table 3).

While the decision to legalize casino gaming has long-term policy implications, public officials, lottery officials in particular, are often driven by short-term revenue considerations. A majority of states have realized double-digit average annual growth in total gaming revenues in the first five years of casinos operating in the state (Table 4).

Hence, the additional revenue provided to cash-strapped state coffers trumps the opposition of lottery officials to the legalization of additional forms of gambling activity.

Table 3 Average annual change in total gaming revenue

State	Average annual percentage increase (%)
South Dakota	56.1
Missouri	35.7
Louisiana	35.7
New Jersey	34.2
Indiana	24.1
Iowa	24.9
Connecticut	20.3
Colorado	19.9
Illinois	6.7
Michigan	2.3

First five years after casino legalization.
(From Ref.^[3])

Table 4 Average annual change in lottery-generated revenue: first five years after casino legalization

State	Average annual percentage increase (%)
South Dakota	51.1
New Jersey	25.2
Missouri	18.7
Colorado	10.6
Connecticut	3.7
Illinois	0.6
Louisiana	−0.4
Michigan	−1.4
Indiana	−1.5
Iowa	−1.5

(From Ref.^[3])

While this “bottom line” finding is significant for states suffering from budgetary stress, the majority of lottery states that have introduced casino gaming have been able to sustain a level of lottery profitability akin to that exhibited before casino legalization. The data reveal a pattern of flattening lottery-generated revenue, not a significant loss in lottery revenue, which is more than offset by the profitability of the newly legalized casino industry. This finding has significant implications for cash-strapped state officials seeking to maximize the “bang for the buck” provided by gambling activity. States operating lotteries that are considering the expansion of gambling activity should heed the lessons that can be gleaned from states that have already taken this same step in the gambling policy process.

The evidence reveals a relative absence of substitution between these competing forms of gambling activity. There are several explanations for the lack of a substitution effect between commercial casinos and state lotteries. First, it is reasonable to assume that commercial casinos and state lotteries are two separate markets differentiated by income level and consumer motive. Lottery players have lower incomes and tend to gamble to enhance their income. Conversely, casino players are “tourists,” i.e., they have higher disposable incomes and perceive casino gaming as a form of entertainment rather than an income-enhancing opportunity. Moreover, lotteries and commercial casinos are qualitatively different. From the perspective of ease of purchase, lotteries present a far more convenient gambling alternative.

CONCLUSIONS

While their dominance over the American gambling landscape has received a series of stiff challenges, state

lotteries will continue to play a significant role in public finance for the foreseeable future. There are several conceivable strategies lottery administrators can embrace to maximize future profits, including manipulating the structural characteristics of gambling (e.g., frequency to gamble) and introducing new products to their game portfolio (VLTs), privatizing operations, and increasing their operational efficiency. Given its weighty contribution to public finance, it is reasonable to assume gambling-generated revenue, and state lotteries in particular, will continue to play an important role within state government budgetary practice.

Administrative Discretion

Kenneth F. Warren

*Department of Political Science, Saint Louis University,
St. Louis, Missouri, U.S.A.*

INTRODUCTION

Administrative discretion refers to the degree of latitude or flexibility exercised by public administrators when making decisions or conducting any agency business. The chief source of administrative discretion comes from legislative bodies that have drafted vague laws. These skeletal statutes essentially allow public administrators the discretionary power to interpret laws as they see fit, as long as their discretionary interpretations do not contradict specific statutory provisions. Public administrators are normally not hesitant to exercise broad discretionary power because the reviewing courts tend to routinely defer to agency discretion (i.e., expertise), and also are specifically prohibited by statute from reviewing any agency action precluding judicial review or committed to agency discretion by law [Section 700 of the Administrative Procedure Act (APA) of 1946, as amended, United States Code: Title 5].

DISCRETIONARY BEHAVIOR IN THE CONTEXT OF FORMAL VS. INFORMAL AGENCY ACTIONS

Public administrators can follow relatively formal or informal procedures. In reality, agency actions are not wholly formal or informal, but a blend of the two. That is, formal action would consist of decision-making processes going solely by the book, whereas procedural steps are meticulously followed to reach decisions. However, because the APA or other laws or rules always permit administrators some administrative discretion when making decisions, even under the most structured or formal decision-making situations, total adherence to formal procedures would be both impossible and undesirable.

Actually, only about 10% of administrative behavior can be legitimately classified as formal.^[1] A formal agency action usually consists of those actions by administrators that fall well within prescribed (usually written) procedures, as dictated by statutes, court rulings, and/or agency rules and regulations. Formal administrative action, in contrast to informal administrative action, is characterized by the limited role an administrator's discretion can play in determining

what procedures can be followed and what decisions can be reached as the result of following specified procedures. One clear example of formal agency behavior can be seen when agencies conduct elaborate, trial-like formal evidentiary hearings where relatively strict rules of procedure are followed. Agency rule making can also be quite formal if administrators follow the elaborate provisions for making rules as required in Sections 556 and 557. Generally speaking, under the APA, informal action refers to any administrative action or inaction (e.g., a decision not to act) that does not involve a trial-like hearing. Formal rule making requires a trial-like hearing and is governed by Sections 556 and 557 of the APA, whereas informal rule making, which does not require a formal hearing, is governed by Section 553 or not by the APA at all. Likewise, adjudications that require a formal trial-like evidentiary hearing are considered formal, whereas adjudications that occur without a trial-like hearing are considered informal.

However, it would be futile to try to classify administrative actions into neat categories of either formal or informal because, in practice, administrators interchange formal and informal procedures. The point is that informal administrative actions are characterized by a broader use of administrative discretion than are formal administrative activities. As the formal-informal agency action continuum in [Fig. 1](#) illustrates, the more agency actions are controlled by administrative discretion, the more informal the agency action is. Conversely, the more formal the procedural codes (e.g., statutes, rules, court orders) that dictate agency actions, the more formal the agency action is. Of course, agency actions would never, in practice, be completely controlled by formal procedural codes or totally dominated by an administrator's discretion. The extreme ends in the continuum only represent the theoretical extremes. Although at times one may not perceive any evidence that an administrator's discretionary decisions are being modified by prevailing legal sanctions, in reality sane administrators are always cognizant of the need to submit somewhat to environmental pressures to conform to expected patterns of behavior. Systems theory, popular in the social sciences, conveys that it would be unrealistic to believe that administrators could expect to survive in

Fig. 1 Discretion's role in formal-informal agency actions.

office for long by totally ignoring prevailing legal and professional sanctions when employing their discretionary powers. An appropriate response to systemic demands would entail keeping the use of discretion within at least minimally tolerable bounds. However, this is not to suggest that administrative discretion is not abused. In fact, social scientists and legal scholars have devoted considerable attention to studying abuses of discretion and how to control them. Yet, it is maintained that the vast majority of discretionary acts by our public administrators are reasonable because they are guided by numerous legal, ethical, and professional standards of conduct forced upon them by the system in which they function. Even when reviewing court cases involving the use of discretion, one finds most allegations of discretionary abuse rest on technical legal arguments, that is, on whether an administrator acted within or outside their discretionary authority, as defined by specific statutes or rules.

EXPANDING ON THE MEANING OF ADMINISTRATIVE DISCRETION

Discretionary actions by administrators are informal administrative acts, even though they may be within an administrator's formal authority. According to Kenneth C. Davis, perhaps the most authoritative source on the concept of administrative discretion, public administrators have discretion whenever the effective limits on their power leave them free to make choices among possible courses of action or inaction.^[2] To Davis, it is important to stress, as it is implied above, that discretion is not limited to what is authorized or what is legal, but includes all that is within the *effective* limits on the officer's power.^[3] Davis added that the specific phraseology he employs to describe discretion is necessary because a good deal of discretion is illegal or of questionable legality.^[3]

Davis stated that the lifeblood of the administrative process is informal discretionary action.^[4] Further, he emphasized that informal discretionary power is enormous, especially when compared with an

administrator's quite limited formal powers.^[4] It is appropriate to mention here that political scientists, in reference to presidential powers, have for many decades acknowledged that president's informal powers are many times greater than their formal powers, as sanctioned by the Constitution, various statutes, and court decisions.^[5,6] Scholars have noted that, although vague and general, statutes and constitutional provisions give rise to discretionary power, but they do not effectively control or limit discretion. Consequently, willful administrators, including presidents, can use their discretionary authority, to make themselves far more powerful than their creators, the Constitutional framers and legislators, probably originally intended.^[1]

When examining the breadth of informal discretionary power, it is easy to understand why it is said to be the lifeblood of the administrative process. Informal discretionary powers include such positive functions as initiating, prosecuting, negotiating, settling, contracting, dealing, advising, threatening, publicizing, concealing, planning, recommending, and supervising.^[1] But the most awesome discretionary power is the omnipresent power to do nothing.^[1] That is, administrators may simply decide not to initiate, prosecute, negotiate, settle, contract, deal, and so on. These negative discretionary powers, in practice, provide administrators with more discretionary clout than positive discretionary powers, because it is far more difficult to check the former than the latter. That is, action, simply because it is action, is easier to control than inaction because checks are designed mostly to cope with abusive action, not abusive inaction.

For those interested in the problems of implementing public policies, the above has obvious implications. Through failing to act, or acting feebly, administrators can use their discretionary powers to help ensure the failure of certain duly authorized public programs under their jurisdiction that they disfavor. Although courts have ruled that administrators are not free to use their discretionary authority to block the implementation of programs authorized by Congress or to prevent persons from receiving their statutory

entitlements, strong-willed administrators may nevertheless have their way in most instances, especially because forcing administrators to comply with statutory demands through court action is so difficult.^[7] As Davis and Pierce concluded: “Judicial review of agency action can never be more than a partial solution to the problem of discretion.”^[1] “Federal agencies take millions of actions every year. It is unrealistic to expect courts to identify or deter each occasional case in which agencies abuse their discretion.”^[4,8] Besides, courts work too slowly, frequently acting after the damage has been done (after administrators have achieved their purpose).

When we think of the discretionary power of administrators, we probably think in terms of how administrative officials may employ their broad discretion to say yes or no to certain major program proposals. For example, in *D.C. Federation of Civic Associations v. Volpe*, 459 F.2d 1231 (1971), John Volpe, then Secretary of Transportation, used his discretion to approve construction of the Three Sisters Bridge, a controversial project vehemently opposed by many civic associations and environmentalists. Although Volpe’s decision essentially constituted an abuse of discretion in the eyes of Judge Bazelon, the *Volpe* case served, inter alia, to demonstrate the vast discretionary powers administrators possess to make final decisions, thus likely determining the fate of major public programs. It is true that administrators possess great discretionary powers in making final decisions, but Davis holds that administrators’ interim decisions may actually carry more weight than their final decisions.^[4] Interim actions may be more subtle, but they can nevertheless make or break programs. In essence, interim decisions determine what steps, if any, should be taken to reach some end. Of course, an administrator’s interim decisions play a significant role in determining the possible ends that will result. Typically, agency administrators use their discretion to make interim decisions in response to such key questions as: Should we investigate the X Company? Should we institute an investigation proceeding? Should we make it a prosecutory proceeding? Or should we make it somewhat one and somewhat the other, allowing its nature to change as it progresses? Should we give X a chance to escape by agreeing to comply? Or should we make an example of X? Should we start a cease-and-desist order proceeding, or should we recommend a criminal prosecution to the Department of Justice?^[4]

Such interim questions appear to be endless. Yet, how each question is answered may make a big difference to, say, Company X, as X may be vitally affected

at every step. Even if it is found guilty of nothing, the investigation may cost half a million dollars. Or its license worth millions of dollars may be jeopardized. Adverse publicity may cripple its business.^[9–11] Discretionary interim decision making may also play a critical role in determining the fate of public policies. In *Implementation*, Jeffrey Pressman and Aaron Wildavsky held that success in implementing public policy programs depends heavily on whether administrators make the vital discretionary interim decisions that permit programs to pass the crucial clearance points necessary for program survival.^[3] In sum, dramatic final actions by public agencies may make frontpage news headlines (“Fed hikes interest rates against Bush’s wishes”), but the daily, routine, nonnewsworthy interim decisions (“Fed decides to discount Labor Department’s 2002 projection on unemployment”) are largely responsible for preventing such agency headline stories from ever occurring.

Thus far, administrative discretion has been defined in the context of substantive decision making, but the scope of informal discretion extends much further. Says Davis: “Discretion is not limited to substantive choices but extends to procedures, methods, forms, timing, degrees of emphasis, and many other subsidiary factors.”^[3] Actually, because administrative law focuses on procedural due process, administrative law scholars and the courts are not so much interested in what substantive choices were made, but in how discretion was used by administrators in making their choices. Fig. 2 illustrates how administrators can ideally exercise their discretion in resolving an administrative problem. This simple model conveys that to resolve an administrative problem, administrators would first have to employ discretion, acknowledge the problem, discover the relevant facts, and then use discretion to search for those applicable laws, rules, and so on, that would settle the matter. But this ideal conceptualization is grossly complicated in reality. In the real world, administrators may use their discretionary powers to deny that a problem even exists. This action in itself must be regarded as a powerful exercise of discretion.

Thus, even if administrators acknowledge the existence of the problem, discretion may be used to define it in a particular way. Naturally, the discretion to define the problem in various ways provides administrators with the flexibility to arrive at different possible solutions. In addition, administrators can employ their discretion to determine what facts are relevant and what laws, rules, and so on, are pertinent. Of course, the discretion to include and exclude facts that are perceived

Administrative problem | Discovery of relevant facts | Application of relevant laws, rules, etc., to facts | Responsible administrative decision

Fig. 2 Simplistic, ideal exercise of discretion.

as relevant or irrelevant allows administrators the opportunity to apply or not to apply various laws, rules, and so forth, because the facts of a situation obviously determine what laws and rules should be applied.

CONCLUSION

Discretionary decisions are also clouded by administrators' past experiences, present environmental demands, politics, and personal values. Regarding police discretion, Joel Samaha commented: "Discretion creates an enormous gap between what law books say and what law officers actually do, because class, race, economics, and politics influence discretion."^[12] Uncertainty also plays an intervening role. A decision as to what is desirable may include not only weighing desirability, but also guessing about unknown facts and making a judgment about doubtful law, and the mind that makes the decision does not necessarily separate facts, law, and discretion. Furthermore, the term discretion may or may not include the judgment that goes into finding facts from conflicting evidence and into interpreting unclear law; the usage is divided.^[13] In sum, discretionary decisions are complicated informal administrative actions that involve factors and processes that are extremely difficult to pinpoint and assess. It is partly for these reasons that abuses of administrative discretion are hard to prove, especially if bad faith must be shown to substantiate the charge that administrators abused their discretionary authority when reaching a decision.^[14]

Administrative Law Judges and Agency Adjudication

William D. Schreckhise

Department of Political Science, University of Arkansas, Fayetteville, Arkansas, U.S.A.

INTRODUCTION

Administrative law judges (ALJs) and agency adjudications are two things about which most people know very little, but both play an important role in the operations of government in the United States. Adjudications and agency hearings are an important component of regulatory enforcement, entitlement disbursement, and internal agency management. Administrative law judges preside over disputes between two or more parties, much like a judge presides over cases brought before a court. However, an administrative law judge is an employee of the *executive* branch of government and, often, one of the parties in the dispute is the agency for whom they are employed. Adjudications are the equivalent to cases and are the conflicts over which the administrative law judges preside. This entry will present the origins of administrative law judges and discuss the current role they play at the state and federal government adjudications.

ADMINISTRATIVE PROCEDURES LAWS AND ADMINISTRATIVE LAW JUDGES

Currently, 1286 ALJs serve in the federal government, holding positions in 26 different agencies (Table 1). They deal with such widely varying topics as disputes over continuing Social Security Disability Insurance benefits and the application of regulations of the U.S. Securities Exchange Commission.

The position of administrative law judge originated with the passage of the federal Hepburn Act (1906). In this act, Congress granted the Interstate Commerce Commission (ICC) the power to appoint “hearing examiners” to act on the commission’s behalf in giving oaths, taking testimony, examining witnesses, and viewing evidence. The ICC’s success with this new position prompted other agencies to follow suit. Between the years 1913 and 1940, Congress granted 18 other agencies the power to appoint their own hearing examiners. The federal Administrative Procedure Act (APA) of 1946 established the hearing officer as a clearly distinct judicial power in each agency. These positions were created to constitute an independent corps of judicial actors assigned powers to preside over agency hearings, but were to do it in a manner less

formal and more flexible than courtroom proceedings, and who could develop expertise in more technical areas of policy. These actors were to remain within each agency, yet through the APA, Congress erected institutional safeguards to ensure that ALJs would hear cases in an unbiased manner, ideally free from agency pressure to ensure due process for the parties involved.^[1] State APAs created similar positions following a comparable logic of organization and institutional design. In 1972, the U.S. Civil Service Commission changed the title of “hearing examiner” to that of “administrative law judge” to reflect a recognition that, in many important areas of public life, ALJs would be hearing cases *independent* of agency pressure, i.e., carrying out the role of an impartial judge in the standard sense.

The Administrative Procedure Act granted federal ALJs a substantial degree of autonomy from their agencies. The APA gave to the Civil Service Commission (now the Office of Personnel Management) the power to determine the qualifications and compensation of individual ALJs. Under the APA, ALJs can be removed only for cause, and before one can be disciplined, demoted, suspended, or dismissed, they first must receive a hearing before the Merit Systems Protection Board. The Office of Personnel Management sets administrative law judges’ qualifications, and the APA ties ALJ compensation to the Executive Schedule. The Civil Service Reform Act (1978) further protected ALJs by explicitly exempting them from annual performance appraisals by their agency, and today, ALJs are the only members of the federal Senior Executive Service who are exempt from them.^[2] When these protections are considered along with the other protections afforded them under the APA, the federal administrative judiciary is clearly the single-most protected class of federal employees vis-à-vis employing agency influence.

However, ALJ independence is not absolute. In the eyes of the courts, federal ALJs are not “constitutionally protected” as are their regular courtroom colleagues. They are also subject to the agency in matters of interpreting the law and agency policy, and the courts have concluded that agencies can assign cases to specific ALJs as they see fit. All federal agencies using ALJs employ some type of review within the agency,^[3] and the courts have ruled that in reviewing

an ALJ decision under the APA, the agency maintains “all the powers which it would have in making the institutional decision.”^[4]

STATE ADMINISTRATIVE LAW JUDGES

On the heels of the passage of the federal APA, a working group of representatives from the American Bar Foundation and the National Conference of Commissioners on Uniform State Laws created a model state Administrative Procedure Act. The model act was fashioned after the federal APA and included provisions for the creation of state ALJs. The model APA has been adopted at least in part by all 50 states

and by the government of the District of Columbia. Today, every state employs ALJs in a fashion similar to federal ALJs.^[5]

State-level ALJs hear different types of cases from their federal counterparts. The bulk of federal ALJs hears cases involving benefits for Social Security claims, with the remainder largely presiding over regulatory hearings (environmental, transportation, securities, mergers, labor, and tariffs). State ALJs hear cases involving workers compensation, alcohol sale permits, public health regulations, environmental protection, utilities regulations, and employment discrimination. Some states will even relegate to their ALJs the authority to preside over driver’s license revocation proceedings.

The ways in which ALJs perform their duties vary somewhat from state to state. In some state jurisdictions, an ALJ is an employee of the agency for which he or she hears cases. In other states, ALJs are employed in a separate “central panel” agency. Central panel agencies were created at the state level to give state ALJs even greater decisional independence. The creation of central panels began after the Administrative Conference of the United States recommended the creation of such agencies for the federal government in the 1970s, and the idea was vigorously supported by state bar organizations.^[6] By 2003, 26 states employed central panels systems, most of them modeled after the California central panel system that was adopted originally in the 1940s^[7] (Table 2). In states without central panels, it is often the practice for the ALJs to be watched over by a board or commission, whose members may be drawn from the interests in cases the ALJs are to hear, as some states require in statute representation on the boards of particular interests.^[8]

It should be noted that some states recognize the difference between formal and informal adjudicative hearings. Generally speaking, state-level adjudications are even less formal than are federal adjudications, generally require less proof to prove a case, and are less likely to involve attorneys for private parties involved in the hearing.^[8]

AGENCY ADJUDICATIONS

Administrative law judges are the most visible actor in state and federal agency adjudications because they hear the vast majority of them. However, they are not the only ones who can preside over adjudications. Namely, the agency commission, board, or agency head may also preside over them. There are no specific processes for how hearings are held. Although all federal agencies must adhere to portions of the APA, each agency is free to develop its own specific methods.

In many respects, agency adjudications look like regular courtroom trials, but are less formal than a courtroom proceeding. Exactly how formal the proceedings are to be is up to each agency, and state-level adjudications tend to be even less formal than federal ones. At a minimum, administrative law judges (or whoever else is presiding over the adjudication) will manage the hearing (e.g., deciding who gives testimony and when), develop the record, maintain the integrity of the hearing, and render a decision based on the record generated in the hearing.

Who gets a hearing? The answer would seem to be a simple one, but it is not. Generally speaking, under the Fifth and Fourteenth Amendments to the U.S. Constitution, anyone in jeopardy of losing their life, liberty, or property at the hands of the government must be afforded due process. At the very least, this means they have to be given a hearing before an independent and

unbiased decision maker. Because it is possible that an individual could lose his or her property at the hands of an agency (questions of life and liberty are handled exclusively by the courts), it seems anyone in this position should be given a hearing. However, the courts have been reluctant to require agencies to conduct adjudicatory hearings in *all* cases where a person stands to lose some type of property. When Congress has passed a law stating an agency must hold a hearing “on the record” for a particular type of case (such as in licensing radio stations), or when the courts have inferred Congress intended to require the agency to hold such hearings (absent of any specific language on the matter), the adjudication provisions of the APA will apply. If there is no such statute, and the agency fails to grant the hearing, then it is up to the courts to decide whether a hearing is in fact required. However, scholars have been critical of the courts for failing to develop a coherent set of principles governing administrative due process and what constitutes a valid hearing.^[9] Even if an individual can show a court they stand to lose property, the Supreme Court ruled in *Mathews v. Eldridge* (424 U.S. 319, 1976) that the agency can take into consideration the burden a hearing would impose on the agency when deciding to hold one, which means the court might not require the hearing even if a person’s property is at stake. Furthermore, even if it is apparent that the individual has a right to a hearing, the Supreme Court has ruled that the hearing can be held *after* the property has been taken away by the agency.^[10]

Generally speaking, adjudications can be grouped into one of four types, increasing in degrees of formality from alternative dispute resolution (ADR) hearings, paper hearings, oral hearings, to formal hearings.^[11] In ADR proceedings, the parties in the case agree to reach a settlement through compromise and negotiation. So-called “paper hearings” are a bit more formal in the respect that the outcome is the product of the hearing officer (and not negotiation), but there is no actual hearing wherein oral testimony is presented. Instead, arguments are presented exclusively via written briefs. Even more formal are oral hearings where the parties present their arguments orally, but without discovery, prehearing conferences, or cross-examination during testimony, as in the case of formal hearings.

The federal APA does not provide a set of comprehensive procedures governing the holding of hearings. Generally, formal hearings will include opening statements, the presentation of the case by the proponent (usually the agency in regulatory hearings), the presentation of the case by the defendant, rebuttal (as allowed by the presiding officer), and closing arguments. Agencies vary by what can be admitted into evidence and are not bound by the Federal Rules of Civil Procedure’s rules on allowable evidence,

although each agency is required to generate their own rules. Agencies may base their decision on evidence that would not otherwise be admitted in a court case (such as hearsay), but the decision must also be based on enough evidence that would have been admitted or show why such evidence was not available.^[12]

Depending on the type of hearing, the administrative law judge will issue an initial decision or recommended decision. Initial decisions are generally issued when the case deals with a well-established issue and, unless overturned by the agency, becomes the agency's decision. If the case deals with a novel issue, the ALJ will issue a recommended decision that may require further action (such as additional proceedings) by the agency. The burden of proof is on the party bringing the case. Generally speaking, the standard of proof is "preponderance of evidence" if Congress has not set the standard already.^[13] However, for immigration deportation cases, reviewing courts have required higher standards, such as the more stringent "clear and convincing evidence" standard.^[14] Many agencies have internal appellate processes, having provisions that allow individuals to appeal the case to the agency board or an intermediate appellate body. Once all appellate remedies have been exhausted in federal adjudications, parties may appeal the case to a U.S. Court of Appeals, except cases from the Social Security Administration which are heard by U.S. District Courts.

CONCLUSION

Few of us who have not had contact with ALJs and agency adjudications know of their existence, but they warrant a degree of attention. Although the courts have recognized their constitutional legitimacy, their platypus-like characteristics of having both judicial and executive functions make them intrinsically interesting. The sheer volume of ALJ activity should garner our attention as well. In the case of the U.S. Social Security Administration alone, ALJs presided over 377,163 cases in fiscal year 1996; in contrast, in 1998,

all 94 U.S. District Courts presided over only 280, 293 civil cases.^[15] Although the average dollar amounts at stake in District Court cases were probably greater, ALJs have been deemed an integral part in the implementation of portions of the Social Security program, the largest of the federal domestic programs. They play important roles in state-level programs as well.

Administrative Reform in Southeast Asia

M. Shamsul Haque

Department of Political Science, National University of Singapore, Singapore

INTRODUCTION

Since the end of colonial rule, administrative reform has been one of the most common domains of social change pursued by developing nations. In these countries, the process of administrative reform became quite intensive immediately after their decolonization to reduce their dependence on colonial administration, create more indigenous institutional structure, and expand the role of government in national economies.^[1] Beyond this historical reason, there were inherent weaknesses in governing institutions—including bureaucratic inefficiency, administrative incapacity, social instability, market failure, and unemployment problem, which also required administrative reform. In more recent years, however, administrative reform in developing countries has been driven by the increasing local needs and demands as well as the contemporary global forces and pressures, in response to which the state has to restructure its administration and revive its managerial capacity in line with the similar reinvention in governance found in advanced capitalist nations.^[2,3]

Administrative reform has traditionally been understood as a formal, planned, and deliberate change in various dimensions (e.g., structure, process, behavior, norms) of the administrative system to improve its efficiency, quality, coordination, motivation, responsiveness, accountability, and so on.^[1,4] More recently, instead of administrative reform, many scholars and experts use the term “governance reform,” which has much broader connotation, encompassing changes in the civil service, policy process, civil society, and state-market relations.^[5] In terms of scope, administrative reform covers all major levels of government (federal, state, local) and public sectors (agriculture, industry, commerce, finance, transport, education, health).^[3,6] Internally, it includes various structural, functional, procedural, normative, and attitudinal changes in the administrative system.

During the recent decades, there has emerged almost a paradigm shift, especially in terms of greater emphasis on the market-driven objective, role, structure, policy orientation, and norms of government administration. Compared to the earlier state-centered model, this newly emerging market-centered model of reform has become the major framework for undertaking administrative restructuring in most countries of

the world. This current reform emphasizes the goal of efficiency and effectiveness, supportive or facilitating role, disaggregated and flexible managerial structure, result-based performance, promarket policies, customer orientation, and business sector norms.^[7,8] Such an antibureaucratic mode of administrative reform largely represents the basic components of “reinventing government” prescribed by Osborne and Gaebler^[9] as well as the principles of the so-called “new public management” presented by Hood,^[10] and it differs substantively from the past reform initiatives undertaken by various governments in line with the traditional bureaucratic model.^[9–11]

The above market-centered model of administrative reform, which emerged in advanced capitalist nations, was gradually adopted by developing countries often under the structural adjustment program prescribed or imposed by international aid agencies. In line with this global trend, in various degrees, Southeast Asian countries have embraced the major components of such reform agenda—including the downsizing of the public sector, deregulation of service delivery, divestment of state enterprises, liberalization of trade and investment, corporatization of public agencies, use of result-based budget and performance indicators, and so on—in the name of economic efficiency, competitiveness, service quality, value for money, and customer satisfaction.^[12,13] There are some major causes and implications of this reform process in Southeast Asia.

FEATURES AND TRENDS OF REFORMS IN SOUTHEAST ASIA

Countries in Southeast Asia—including Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, and Vietnam—vary significantly with regard to their territorial size, demographic pattern, ethnic and religious composition, colonial background, social structure, political system, and economic development.^[14] In the past, this diversity created certain differences among these countries in terms of the nature and objectives of administrative reform. In recent years, however, most of these countries have adopted reforms in line with the globalized market-led model of public management mentioned above. This section discusses the major features and

trends of current administrative reform, including the institutional, functional, structural, normative, and policy reforms in various Southeast Asian countries.

Institutional Reform

Most governments in Southeast Asia have undertaken major reform initiatives to restructure the public sector based on promarket assumptions. Examples of such initiatives include Public Service for the 21st Century (PS21) in Singapore, Panibagong Sigla 2000 (Renewed Vigor 2000) in the Philippines, Public Sector Management Reform in Thailand, Malaysia Incorporated in Malaysia, Resolution on Public Administration Reform in Vietnam, and National Development Program in Indonesia.^[13,15] In addition, a new set of market-friendly state institutions has been introduced, such as the Public Sector Divestment Committee in Singapore, the Committee on Privatization and the Asset Privatization Trust in the Philippines, the Steering Committee on Reduction in the Size of the Public Service in Malaysia, and the Public and Private Sector Committee in Thailand.

A more critical institutional feature of administrative reform in the region, however, is the streamlining or downsizing of the public sector in line with the current global trend. For example, the Thai government adopted the downsizing strategies such as the recruitment freeze, early retirement scheme, abolition of postretirement vacancies, and replacement of underutilized employees.^[15,16] The Philippine government also decided to downsize the number of public sector employees by 5–10% and Singapore government by 10%.^[17,18] Similarly, the governments in Indonesia and Malaysia have decided to streamline state bureaucracy by cutting public expenditure and reducing the number of civil servants.^[19,20] Even in communist Vietnam, the government has introduced unprecedented reform measures and reduced the number of ministries and agencies from 76 in 1986 to 48 in 2001 and the percentage of public sector employment from 10% in 1991 to 8.7% in 1994.^[19,21]

Functional Reform

In Southeast Asian countries, the state bureaucracy played a crucial role in socioeconomic development, whereas the private sector took part in this development process under state regulation, control, and coordination. However, the recent administrative reform has moved away from such a dominant role of the monopolistic public sector and emphasized the role of market competition and private enterprise. This new mode of reform defines the function of public administration as that of a catalyst or facilitator rather

than main actor or leader—the purpose is to restructure the role or function of the administrative system in such a manner that it can enable (rather than control) the role played by the business sector.^[22] In both Malaysia and Singapore, the role of the public sector has been redesigned to reduce its functional scope and to transform it into an enabling agent for the private sector, which now is supposed to play the leading role in economy and society.^[11,20] Such a facilitating role of the public sector has also been prescribed in the Philippines, Thailand, and Vietnam in their recent initiatives of administrative reform.^[23,24]

The functional dimension of the current administrative reform in the region has also greater emphasis on the satisfaction of public sector “customers,” which represents a shift from the earlier focus on the *entitlement* of “citizens” to basic services provided by the state. Similar to the businesslike customer-oriented approach adopted recently in the public sector by most developed nations, the concern for customers or clients has gained increasing significance in public management in Singapore, Malaysia, Thailand, and the Philippines. Top public officials are now encouraged to develop customer-oriented outlook and customer-friendly attitude in these countries.^[13]

Policy Reform

In most Southeast Asian countries, compared with their earlier state-centric public policies such as nationalization, regulation, and protectionism, the recent reform initiatives have moved toward more promarket policies such as privatization, deregulation, outsourcing, and liberalization. In the region, the privatization policy encompasses all major sectors, including telecommunications, electricity, airlines, railway, banking, finance, petroleum, transport, mining, construction, tourism, and so on. For instance, Malaysia introduced massive privatization under its Privatization Masterplan, Singapore adopted privatization policy planned by its Public Sector Divestment Committee, and the Philippines launched the privatization program through its Committee on Privatization. Similar privatization exercises were carried out in Thailand, Indonesia, Cambodia, and Vietnam.^[19]

Southeast Asian countries have also pursued the deregulation and liberalization of trade, investment, and foreign ownership. For foreign investment, Indonesia has liberalized such sectors as electricity, railways, telecommunications, and airlines, which used to be under state control. Malaysia, Thailand, and the Philippines have withdrawn restrictions on foreign ownership and adopted incentives for foreign investors such as tax exemption, duty-free imports, and so on. The liberalization of trade and investment has also

taken place in Cambodia, Laos, and Vietnam.^[25] These recent changes certainly represent a significant policy reform in Southeast Asia.

Structural Reforms

Despite the diverse historical origins of the administrative systems in Southeast Asian countries, in general, they became increasingly based on the principles of a bureaucratic model that prescribes central control over financial, procedural, and personnel matters. However, in line with the abovementioned “new public management” model suggesting disaggregated and decentralized management practices, most countries in the region have moved toward reforming their administrative systems based on greater managerial and financial autonomy and flexibility. In Singapore, for instance, the government has restructured various agencies or departments into the so-called “autonomous agencies” assigned with considerable managerial autonomy in personnel and financial matters.^[11]

In the case of Thailand, the government has also created various “autonomous public organizations” that have been provided with autonomy in their respective financial and personnel policies. In Malaysia, the traditional financial controls over government departments have been transformed into more decentralized financial management with greater autonomy in the budget matters. Similar trends of administrative reform in favor of operational autonomy in management can be found in Indonesia and the Philippines.^[15]

Normative-Attitudinal Reform

In the past, in line with the bureaucratic model that emerged largely in Western liberal democracies, Southeast Asian countries adopted various reform measures to inculcate administrative norms and attitudes based on neutrality, equity, representation, and accountability, although such standards were not often observed in practice. However, under the recent reform in these countries, greater emphasis has been placed on values such as efficiency, economy, competition, value for money, service quality, and customer satisfaction. In Malaysia and the Philippines, there is greater concern for administrative efficiency, effectiveness, quality, partnership, and customer-orientedness.

Similarly, in recent development plans and programs, Indonesia and Thailand have emphasized these market-based normative and attitudinal standards. In the case of Singapore, the current reform initiatives for the public service, especially the PS21, also stress the realization of values such as competition, efficiency, quality, and customer orientation.^[13] All these countries have also adopted various

training programs to attitudinally reorient their public employees to make them more quality-conscious and customer-friendly.

CAUSES AND IMPLICATIONS OF REFORMS IN THE REGION

In general, the main factor or force behind the current market-driven reform in the public sector has often been attributed to the globalization of trade and investment, decline in state capacity, and erosion of state autonomy, which allegedly led to the crisis of the state and thus required substantive reforms in state policy and administration. According to Pereira,^[3] this pressure of globalization on the state was reinforced by the international business interests and neoliberal policy elites demanding or advocating privatization, deregulation, liberalization, and other market-friendly institutional reforms. Because Southeast Asian countries were already integrated with the world capitalist system, they had to respond to the new globalized political economy and its forces by undertaking such reform initiatives often prescribed by international aid agencies.

For most developing countries, including those in Southeast Asia, the World Bank identified some major problems with the public sector, suggested reform measures such as downsizing, retrenchment, divestment, and so on, and extended loans mainly to those countries which could demonstrate commitment to these prescribed reforms.^[5] To a certain extent, countries such as Thailand, Indonesia, the Philippines, and Vietnam introduced divestment, deregulation, and liberalization under the influence of the International Monetary Fund and the World Bank.^[19] It is often the external debt and dependence of these countries that created an opportune context for these international financial institutions to exert such policy influence or pressure. However, it should be added that there are also internal factors—including domestic fiscal crisis, public sector inefficiency, and local business interests—which required such market-led reforms in these countries.

What are the implications of these contemporary administrative reforms? In terms of positive outcomes, the current promarket administrative reform represents a serious challenge to the traditional, centralized, monopolistic, and elitist state bureaucracy that existed in most Southeast Asian countries. This recent reform is likely to make the public sector more competitive, cost conscious, and performance-oriented and contribute to a greater degree of transparency, decentralization, service quality, and responsiveness to its clients or customers. However, there are critics who often point out various negative consequences of this

contemporary reform. More specifically, for some scholars, the new model of administrative reform based on neoliberal assumptions and market-driven principles and policies has been largely imposed on developing nations, and it represents a form of ideological hegemony.^[26]

It is stressed that under the current public sector reform, the privatization and restructuring may have diminished state sovereignty and increased foreign ownership in certain Southeast Asian countries (e.g., Thailand, Indonesia, Malaysia, and the Philippines) that suffer from heavy foreign debt and dependence and thus are vulnerable to external policy imposition.^[27] Internally, on the other hand, policy reforms such as deregulation, divestment, welfare cut, and customer focus may not equally benefit all social sections or income groups—these reform measures are likely to benefit the business and political elites, overlook the concerns of ordinary citizens, and expand the gap between public officials and common citizens.^[19,28]

In terms of the impacts of such market-led reform on the administrative system itself, the increasing similarities between public administration and business management may pose a challenge to the “public” nature of public service, perpetuate its identity crisis, and adversely affect the pride and morale of public employees.^[13] In addition, under the current reform, the expansion of operational and financial autonomy of public managers and their growing interaction and partnership with business executives may generate new avenues for administrative corruption and thus compromise public service integrity. In other words, in the current context of managerial autonomy and partnership with the private sector, it may be necessary to introduce additional safeguards to prevent any kind of wrongdoing resulting from these recent changes.

CONCLUSION

It is evident from the above discussion that during the recent decades, Southeast Asian countries have introduced considerable administrative reforms based on market-based assumptions and principles, which include changes in the public administration system in terms of its institutional nature and scope, role and function, public orientation, structural pattern, and normative priority. Although there are some potential benefits from such administrative reforms, there are also some major adverse consequences. In this regard, there is a need to consider some major critical concerns by top policymakers in charge of initiating and implementing administrative reform in each of these countries.

First, in pursuing administrative reform, most developing countries, including those in Southeast

Asia, have often followed models that emerged in advanced capitalist nations. In particular, the Weberian bureaucratic model that evolved in Western nations was imitated by Southeast Asian countries in modernizing their administrative systems without much attention paid to their unique local contexts. On the other hand, the current process of administrative reform in the region has largely been based on the neomanagerial model (“new public management”) that originated in countries such as America, Australia, Britain, Canada, New Zealand, and so on. This new model of reform, which is globally touted as “good governance” or “best practices” by international agencies, is also being reproduced in developing nations without much concern for the “peculiarities of public service problems and their settings” in these countries.^[26] On this ground, countries in Southeast Asia should try to replace the imitative models of administrative reform borrowed from outside or imposed on them by external actors or agencies.

Second, to pursue a need-based, indigenous model of administrative reform, the policymakers in Southeast Asian countries should examine and seriously consider their respective contextual factors. It is stressed by some scholars that in general, administrative reform should not be based on the assumption of “ideological or cultural supremacy” of any particular society (especially the West); it should rather be determined by each nation’s contextual factors such as political history, cultural tradition, nature of government, and constitutional features.^[26,29] Each country in Southeast Asia has its own unique contextual factors—including the colonial legacy, state formation, political culture, social relations, cultural and religious beliefs, economic resources, and citizens’ needs and expectations—which should be seriously taken into account in formulating administrative reform policies and their eventual consequences. As Heeks and Bhatnagar^[30] mention, in general, “Public managers would do better to open their eyes and ears to their immediate surroundings rather than burying their noses in MBA textbooks in seeking guidance on reform.”

Finally, it is essential to understand that administrative reform should be based on a comprehensive framework, which emphasizes reforms in other social domains (political, economic, and cultural) that affect and are affected by changes made in the administrative system. It is often emphasized that administrative reform can be successful only when it is complemented by corresponding reforms in other realms of society within which the administrative system exists and functions.^[31] In Southeast Asian countries, most initiatives for administrative reform have been undertaken without much innovations made in politics, economy, society, and culture—this parochial or unbalanced nature of administrative reform represents a

major obstacle to its successful realization or implementation. In this regard, the policymakers in each of these countries must reexamine the shortcomings of such a parochial approach to reform that focuses mainly on the administrative system and adopt a more comprehensive and multidimensional reform outlook that covers other relevant and important domains of society.

Agenda Setting

David A. Rochefort

Department of Political Science, Northeastern University, Boston, Massachusetts, U.S.A.

INTRODUCTION

Agenda setting is the process by which issues are selected for attention by government. Agenda setting is generally defined as the first phase of policy making, before formal consideration of policy proposals. As a scholarly perspective, agenda-setting research focuses on the linkage between the social environment and the polity, highlighting the role of ideas, current events, media coverage, and conflict expansion in the origin and prioritization of issues. Institutional gatekeeping also plays an important role in controlling access to the political agenda.

BACKGROUND AND OVERVIEW

Prior to the emergence of the agenda-setting framework, the study of public policy was limited in several respects. Of primary concern had been the question of participation in political decision-making. Elitists maintained that power and control lie in the hands of a small ruling group,^[1] while pluralists argued that the influence of organized interests varied according to issue.^[2] These approaches gave much attention neither to the predecisional phase of policymaking nor to the means by which private concerns become identified as public issues. Easton's^[3] system model of government did specify societal demands as a key institutional "input," yet without analyzing the pathways by which some demands succeed in entering the political mainstream while others languish without official interest.

The agenda-setting model is concerned with just this transition from social environment to political arena. It arrived on the scene when scholars were increasingly prone to view the policy process as having a natural history that exhibits the properties of a cycle with well-defined beginning, middle, and ending stages.^[4,5] The agenda-setting perspective supplied a new vocabulary and set of analytical tools for examining the early stages of this process in which an issue first acquires its political identification. It also addressed the interplay of political advocacy, media coverage, and public opinion formation as crucial in determining access to the polity. If we recognize society as the breeding ground for an almost unlimited number of conflicts, losses,

and grievances at any point in time, then agenda setting examines the funneling process by which only certain claims among these attain official standing and elicit a response from those in power.

Cobb and Elder's^[6,7] *Participation in American Politics* was pivotal in laying the foundation for this agenda-setting framework. Rather than elite or pluralist theory, Cobb and Elder based their work on Schattschneider's^[8] model of social conflict. Schattschneider acknowledged the bias of the political system, which favors those with power, money, and social status, while noting the tendency of political officials to avoid conflict. However, Schattschneider portrayed conflict expansion as a means by which disadvantaged groups compel official attention to their concerns, to the extent that the group that builds scope, intensity, and visibility in a conflict increases the possibility of agenda access.

For Cobb and Elder, the issues under debate are just as important as the groups involved in political action. Building on Schattschneider's idea of "issue redefinition," i.e., broadening the meaning and value implications of an issue, they proposed that certain issue characteristics—specificity, social significance, temporal relevance, complexity, and categorical precedence—are related to issue expansion. "Triggering mechanisms" are unforeseen events, such as natural catastrophes, changes in technology, social conditions, and scientific knowledge, or a sudden act of violence, which launch an issue by moving it into the spotlight of media coverage and public awareness. Issue advocates promote their cause by taking advantage of these circumstances.

Language animates and directs political conflict. By combining facts and emotion-laden symbols, groups use rhetoric to mobilize and maintain their followers, arouse latent public support, provoke media coverage, and dissuade the opposition.^[6,7] "Initiators," or policy entrepreneurs, are those individuals who lead the way in issue expansion by gathering information, gaining publicity, contributing to organizing efforts, and engaging in symbolic manipulation.

According to Cobb and Elder's formulation, two kinds of agendas exist. The systemic agenda refers to the "general set of political controversies that will be viewed at any point in time as falling within the range of legitimate concerns meriting the attention of the

polity.”^[7] The institutional, or formal, agenda is limited to that subset of issues “scheduled for active and serious consideration by a particular institutional decision-making body.”^[7] When the gap between these two types of agendas becomes extreme in a society, it is a formula for political delegitimation and instability.

AGENDA-SETTING RESEARCH

Nelson^[9] was one of the first scholars to apply the agenda-setting framework in a detailed policy case study. Although the mistreatment and neglect of children is not a new phenomenon, only in the early 1970s did child abuse gain a place on the national legislative agenda. Agenda entrance resulted from the U.S. Children’s Bureau’s interest in child abuse during the 1950s, steady growth of mass media coverage in the 1960s and 1970s, and the diffusion of state child abuse reporting laws in the 1960s. When the Congress adopted the Child Abuse Prevention and Treatment Act of 1974, it not only reflected the special advocacy of a powerful Senator, Walter Mondale, but also increased public awareness of the problem. The issue’s success owed much to its symbolic dimension, as the image of children victimized by adult violence invoked sympathy, stimulated moral indignation, and promoted political consensus.

In the aftermath of Nelson’s work, there has been a steady outpouring of public policy research informed by agenda-setting concepts. The topics of these studies are diverse—aging policy,^[10] social welfare,^[11] pesticides,^[12] drug policy,^[13] children’s health care,^[14] transportation policy,^[15] and more. Today, it would be hard to imagine a public policy textbook that omitted discussion of the politics of agenda setting. Meanwhile, the agenda-setting approach has not remained static. Researchers have both adopted and adapted it, fleshing out the framework’s details while extending it in new directions.

Kingdon^[16] examined the “long smoldering” process of policy initiation. He identified three streams that ebb and flow constantly through the system of government decision-making. A “problem stream” consists of the social problems perceived by government officials to be of interest and importance. A “policy stream” is the “primeval soup” of ideas for government action. Specialized policy communities spanning public and private sectors generate these alternatives and proposals, while policy entrepreneurs work to gain prominence for certain ideas over others. A “political stream” is the combination of several factors—national mood, the alignment of organized political forces, the balance of power and administrative capacity within the government, and the propensity

for bargaining—that define the political system’s readiness for action. Significant changes in the political or problem streams can “open the window” of opportunity in the policy process. At such a time, the usual obstacles are reduced and a compatible policy proposal enjoys heightened chance of adoption. But these conditions are fleeting, and policy entrepreneurs must seize the moment by attaching their preferred proposals to the problem needing solution. For Kingdon, the best way to understand movement on the government agenda is to pay attention to those instances when two or, most powerfully, three decision-making streams become coupled and carry an issue forward on an almost irresistible current of support.

“Punctuated equilibria” is the term used by Baumgartner and Jones^[17] to describe the rise and fall of policy subsystems. A subsystem is an organized institutional structure involving political decision-makers, stakeholder groups, and technical experts who share a central idea about the purpose of a policy area and produce a stable equilibrium in policy making over time. Eventually, however, equilibrium conditions can be overturned, or punctuated, by an alternative “policy image” that captures media interest and broadens policy debate. Often, this process involves new venues of decision-making, such as a change in legislative committee jurisdiction, a shift between branches of government, or movement to another level of government. Issue advocates strategically engage in “venue shopping” by looking for the most advantageous arena in which their issue could be advanced. Sabatier and Jenkins-Smith^[18] in their work on “advocacy coalitions” clarify how issue reconceptualizations of this kind fragment existing policy subsystems while attracting participants from other policy domains.

Birkland’s^[19] consideration of the role of events as triggers in agenda setting encourages attention to all “potential focusing events” to understand those qualities and circumstances that lead to a political response. In general, a focusing event is a rare, sudden, and harmful occurrence which affects a particular locale or social group and receives widespread publicity. But the impact of focusing events is not standard for all issues. Rather, the attributes of the event, as well as the policy domain affected, matter. Whether or not a well-organized policy community exists, the degree of polarization inside that community, and the role of experts all modulate the effect of focusing events in terms of an issue’s placement on the political agenda, the scope of policy change, and the distribution of policy benefits.

The original insight that issue characteristics affect conflict expansion has led to a more thorough identification of issue attributes and their political relevance.^[20] Problems can be defined along many

dimensions, including causality, severity, incidence, novelty, and proximity. The characterization of a problem as a “crisis” is a common ploy by issue advocates seeking to gain rapid agenda access. In social policy making, the description of problem populations—as deserving or undeserving, socially deviant or mainstream, and culpable or innocent—helps predict how much attention is devoted to the problem and which policy instruments are selected. In addition to problems, solutions are defined with respect to their availability, acceptability, and affordability. Numbers pervade the process of problem definition in their use, by experts and advocates, to document the existence of social problems. Numbers can also stimulate fierce political disagreements over measurement techniques and normative standards.^[21] Through force of repetition, numbers become potent symbols in their own right, evoking shared meanings and strong emotions about an issue.

Agenda setting is a two-way process in which opponents seek to contain conflicts that threaten their interests. Cobb and Ross^[22] revisited the idea of conflict containment, subsuming it under the more global dynamic of agenda denial. Their concern is the “non-consideration” of issues, despite social conditions that meet objective standards of seriousness. A narrow resource-based calculation often does little to explain why issue opponents are victorious in these situations. What is needed, instead, is an understanding of how the manipulation of cultural and political symbols can limit the appeal of an issue or cast it as unsuitable for public intervention. Cobb and Ross present a catalog of low-cost, medium-cost, and high-cost strategies used for keeping issues off the formal agenda in this way.

An analysis of the failed health-reform effort of the first Clinton administration shows how agenda setting on the elite and public levels need not be in sync. Hacker^[23] traces how media coverage, shifting public opinion, and responsive public officials together expanded the health care issue and propelled it onto the national agenda. Yet, an intriguing question is why Clinton and his advisers put forward a reform proposal built on the relatively unknown model of “managed competition,” which is a confusing hybrid of regulatory and free-market principles. Hacker finds that managed competition was a compromise meant to find favor with liberals and conservatives while achieving the benefits of a strong public program without “big government.” The notion owed its prominence to an influential network of actors in the health policy, health industry, and media sectors. In the end, however, the value of managed competition as a technical and rhetorical solution proved illusory. Once opponents redefined managed competition by emphasizing its uncertainties, public support quickly

evaporated. This episode demonstrates the danger in agenda setting that policy entrepreneurs will succeed in advancing policy designs that conflict with broad political, institutional, and cultural requirements.

Considering all that has been said, the media’s role in agenda setting is no less complex than it is essential. Media coverage gives an issue visibility, a key ingredient for standing on the public agenda. The media also provide a battleground for groups seeking to increase or limit conflict expansion. Media coverage is, in part, reactive to the established policy agenda, but it is not identical with this group of issues or the concerns of public opinion.^[16,17,24] At times, reporters and editors act as policy entrepreneurs themselves when elevating issues through investigative work or by advancing favored policy positions. Finally, the media contribute to problem definition through the causal frames adopted for story presentation.^[25] With the spread of new media forms such as the world wide web and 24-hour cable news, the possibilities for media influence within agenda setting are only multiplied.

NEGLECTED AREAS OF INQUIRY

Early on, the agenda-setting framework was suggested as a tool for studying comparative politics and government, as well as U.S. policy making.^[26] A focus on agenda setting can highlight how politics differ with regard to the regulation of social conflict, problem definition strategies, the groups involved in policy formation, and the relationship between cultural values and policy choice. Institutional processing of new issues is also an important regime-level variable across nations. Despite a number of studies of agenda setting in contexts other than the U.S.A., truly comparative research applying the model to two or more polities, either in terms of political process or a single policy domain, has been rare.^[27]

Similarly, the analysis of agenda setting in international politics and policy making is a promising subject, although it is difficult because of the multiplicity of decision-making venues for many of these issues.^[28] A conceptually sophisticated investigation of agenda setting in the European Parliament has been produced by Tsebelis,^[29] who modeled the rational preferences of participants under the rules that make it easier to accept than to modify proposals. Tsebelis’s concept of “conditional” agenda setting describes how an unusual set of institutional procedures gives the Parliament an unexpected power over member countries for policy proposals that reach a certain threshold of support, but little influence outside these limits.

To date, the agenda-setting framework has also been used primarily for political situations in which an outside group seeks to gain access to the formal agenda by activating uninvolved groups and the general public. However, “outside initiative” is only one of a set of alternative models featuring different patterns of conflict expansion. Under the “inside access” model, an issue that originates with government officials or a strategically positioned interest group attains the formal agenda directly, without expansion to the public. The “mobilization” model refers to a process in which political leaders initiate an issue or policy and then attempt to gain the public’s support for policy adoption or program implementation. Contemporary policy issues in the U.S.A., such as the war in Iraq and the proposal for social security privatization, suggest the potential value of these latter descriptive schemas.

With respect to methodology, most agenda-setting research has taken the form of qualitative case studies. With the exception of works done by Baumgartner and Jones^[17] and a few others, the framework has not been associated with quantitative empirical analysis. Although the variables involved are many and not always easy to measure, there are aspects of the model pertaining to media coverage, public opinion, and institutional agendas that invite further efforts at quantification.

CONCLUSIONS

At the time it was introduced, the agenda-setting framework supported an understanding of the policy process as a sequence of well-delineated stages, and its applications were generally confined to the beginning of that sequence. Over time, scholars have recognized the relevance of agenda-setting concepts across the entire policy cycle, whenever issues and policies are being prioritized for action or review. Also, it is now evident that policy information flows in more than one direction, creating feedback loops between stages that contribute to problem definition and political mobilization. The agenda-setting framework has shaped a generation of public policy research increasingly sensitive to this fluidity.^[19] Its versatility is confirmed by the variety of policy areas it has illuminated and the rich body of scholarly work it continues to inspire.

Agricultural Policy

William P. Browne

*Department of Political Science, Central Michigan University,
Mount Pleasant, Michigan, U.S.A.*

INTRODUCTION

Agricultural policy was once synonymous with farm (and ranch) public policy, the actions of U.S. government to modernize and industrialize producers of food and fiber commodities away from subsistence agrarianism. Thus, agricultural policy has been categorized as economic policy, or sector support. Today this is a misleading description. The evolution of modernizing agricultural policy touches myriad domestic social and international affairs matters through a formidable Agricultural Establishment. Issues of hunger, food safety and nutrition, trade, world food needs, environmental degradation, soil and water conservation, farm worker status and protection, rural poverty, and rural development are each institutionally central to contemporary agricultural policy.

POLICY INNOVATION: THE CREATION OF AN AMERICAN AGRICULTURAL ESTABLISHMENT

Public policies to benefit from American food and fiber producers understandably predate the formation of the Republic.^[1] Farmers and what they produced were assets deserving of attention. That should hardly be surprising since both British sovereigns and constitutional lawmakers governed lands dominated and hopefully stabilized by farmers and ranchers once the wilderness trail blazers and adventurers passed through. The early Americas were truly low-density rural societies, characterized by small, family-controlled farms, except in the South where large plantation owners shared space with generally small-scale growers, often tenants.^[2]

Policy debates over improving the status of farmers flourished for 20 years prior to the Civil War; farm prosperity was of obvious value to national growth. Resolution of these debates proved impossible due to national geographic divisions. With the outbreak of war and with a shaken northern electorate, otherwise divided Republicans quickly coalesced to pass popular legislation intended to keep their party in congressional control.^[3] Southern congressional members who had withdrawn from Washington were no longer an obstacle to public policy that assisted small

landowners. In 1862, four significant acts were passed: the first Homestead Act, to provide tracts of federal land to new small-scale settlers; the Morrill Act, which deeded federal lands to the states for use in capitalizing state "land grant" colleges of agriculture and mechanics; the establishment of the U.S. Department of Agriculture (USDA), as a small agency to identify and promote proper seeds and plants to growers who lacked both funds and horticultural knowledge; and the Railroad Act, which subsidized railroad expansion and, incidentally, brought means of transportation for farm supplies to the West and farm products to the East.

Although these distinctive policy innovations were administratively unplanned by politically troubled lawmakers and rarely seen by any contemporaries as an integrated approach to agrarian modernization, they proved to be just that.^[4] New federal and state institutions were being created to serve an ever-expanding cadre of American family farmers. Science and discovery were being put in motion through the creation of public sector experts who could bring applied knowledge to farmers.

Expertise and administrative outreach were facilitated throughout the remainder of the nineteenth century, in no small part because so many farmers were not commercially viable. The states were building their land grant colleges and creating state departments of agriculture to promote farming and ranching. Because so few farmers availed themselves of educational services, many state institutions employed extension administrators to work personally with farmers, usually housing these case workers within county governments.^[5]

The federal government responded similarly. Legislation created federal agricultural experiment stations in 1893, locating them within the states and usually adjacent to land grant colleges. These non-integrated institutions were to engage applied science even further, conducting research specifically on local agricultural problems and local farm failures. The Black land grants were created in 1890, to bring science, education, and outreach to large numbers of unserved southern farmers. The USDA was given full cabinet status in 1889, after intensive farm lobbying. Thus, an ever-growing department could represent its increasing number of programs on an equal footing with those of military, foreign affairs, public lands, and economic

policy makers. Finally, in 1914, the federal government passed an extension act to ensure a national farm outreach policy and join federal agricultural institutions to those of the states and counties in a highly decentralized process.

By World War I, two lasting innovations of general policy importance to the development of modern public administration had occurred. First, an unprecedented network of federal institutions had been created in a *laissez-faire* American government. Big government, fostering expertise and promoting applied science was in place; its institutions provided a *mélange* of policy for federal lawmakers to oversee, fund, reconsider, and recast into the twenty-first century. Second, what public administration scholars refer to as “picket-fence federalism” was in practice on a large scale. The plight of American farmers, chronically plagued by low prices and extensive supplies of their products, became a joint undertaking of all three levels of American government. No level was truly “in charge.” Agricultural specialists emerged at each level, maintained an ongoing dialog with one another, relied on often shared field administrators to demonstrate institutional worth, and provided mutual support both administratively and politically. It was little wonder that, in the 1950s, economist Theodore Shultz looked back at this maze of public institutions and pro-farm sector policies and almost alarmingly labeled it the “Agricultural Establishment.”^[6]

POLICY EFFECTS, POLICY EVOLUTION

The concept of Establishment unwittingly communicates the impression of a favored elite; and, surely, agricultural institutions brought elitism to American farming. Farmers who were better prepared, better funded, and more likely to join in local organizations were also more likely to gain educations for themselves and family members, pay attention to agricultural field administrators, and employ applied science and its technology.^[4] As a consequence, larger-scale farmers gained the most from publicly assisted technological adaptation as early innovators. They then produced greater amounts of commodities, did so at lower costs, and at least for the short term gained profits even with low prices. Smaller-scale, less-positioned farmers did not, bringing poverty, economic failure, and farm exits. Larger-scale neighbors having excess capital assets in turn purchased their lands. The ongoing demise of the subsistence, peasant farmers of America led to the emergence of commercial farm elites who made use of Establishment resources.

Agricultural policy prior to and just after 1900 provided more than field administration services to producers. A regulatory era ensued. Substantive legislation

provided opportunities to those who could and would take them, which again disproportionately meant farm elites. Policies to federally fund irrigation and drainage were established, as were programs for land improvement to facilitate production. Both farmer associations and marketing cooperatives were subsidized. Local farm bureaus were encouraged to form with institutional assistance. Loans and credit were extended to cooperatives. The cooperatives were freed from antitrust laws and assisted in marketing safe products. The net effect was to give agricultural producers special marketing and political status and, more important, lower their cost of production due to federal contributions.

The legacy of such opportunistic policy lingers on. The USDA still supports and regulates cooperatives. Food handlers are inspected. Water projects, loan programs, and farm credit remain consequential components of agricultural policy, in part because of strong state government advocacy. The USDA’s Forest Service provides roads through national forests to subsidize lumber companies. Public policy makers, accordingly, struggle to supervise and reshape the allocation of policy set in motion over 100 years ago. They engage these evaluative struggles with the same institutional supporters who promoted farm assistance in its beginning, agricultural field administrators with their local farm connections and technological interests.^[7] Thus, administrative components of agricultural public policy serve as advocates of both continued and reformulated service and regulatory policy, much as did the many patronage appointees in agriculture in the nineteenth century. While that early generation of agricultural experts capitalized on their political contacts at home and in Washington, modern field administrators more fully embrace the expert guise of home state economists, horticulturalists, agronomists, and nutritionists. The single constant is that a locally and professionally fragmented array of field administrators sets much of the agenda and dominates many of the debates over future agricultural policy.

THE CREATION OF MARKET POLICY: THE MAJOR CONCERN

Agriculture enjoyed several years of good production and high prices in the early twentieth century, through World War I. The transition to commercial agriculture flourished as a result, solidifying cooperation between producers and field administrators. However, commercial producers, often indebted by expansion, were ill prepared for a postwar fall off in demand and the unavoidable collapse of prices. Agricultural depression began in 1920, predating general economic collapse by 10 years. Both agricultural institutions and newly

strong farmer organizations became advocates of direct government intervention in the farm economy, displacing the emphasis on more and better farm services and regulation.

It was not until 1933 that policy makers responded to grassroots demands and moved to directly subsidize farmers by intervening in the marketplace of production and sales. That action, which was intended to raise prices by limiting production, set in motion a complex series of policies that would essentially drive agricultural policy throughout the century. The policy vehicles were the Agricultural Adjustment Acts of 1933 and 1938, along with the Soil Conservation and Domestic Allotment Act of 1936.^[8]

The featured program types that evolved from this legislation included marketing orders, which licensed agreements by commodity cooperatives to hold exclusive sales rights to their sorts of products by negotiating pricing and trade practices; production controls, either mandatory or voluntary, which limited grower planting in return for financial payments; direct supports, payments made by the federal government to landowners, for cutting back production or some other contribution to policy, such as constructing soil conservation projects; and loan guarantees, which provided preproduction loans to farmers at guaranteed rates and allowed producers to voluntarily forfeit crops to government if commodity prices fell below loan rate levels.

Four other consequential and lasting features were introduced into agricultural policy by these programs. First, it was increasingly logical to wrap the many service, regulatory, and market policies of agriculture into one extensive renewable bill, called an omnibus act. These farm bills allowed policy makers to oversee and recast policy in cycles that concentrated attention to agriculture's many details. Second, local (mostly county) and state farmer-operated committees were established to rule on producer eligibility for the previous programs. Third, policies were set by individual commodity, with no general allocation scheme and the omission of numerous products. Fourth, the largest payments and benefits accrued to the largest producers, the most commercially able farmers. Only by rewarding the largest producers would these growers cut significant sums of production and effect prices. Small-scale farmers and their small cuts in production would negligibly influence prices. Of course, this policy rewarded those who had found favor with institutional administrators. Moreover, programs for the rural poor, for small farms, and for tenants were strongly resisted by administrators and given diminished attention in the New Deal and beyond.

Agricultural policy, through 2002, saw a confusing mix of these programs recurring, coming and going, and being constantly readjusted from one omnibus

farm bill to another. Variances in crop prices, partisan politics, congressional control, and interest group strength heavily affected changes. For example, after the House and Senate agricultural committees lost control, Congress passed the Federal Agriculture Improvement and Reform Act (FAIR) as the 1996 farm bill. This act was directed by congressional leaders who had little contact with agricultural professionals.^[3] Their intent was to phase out intervention and all commodity support programs by 2002, letting the marketplace then set prices.^[9] That act provided large direct payments as phase-outs to farmers over a 7-year period; it was later supplemented with increased emergency direct payments from 1998 through 2001. In 2002, with farm prices again depressed, Congress, with the committees once more in control, reversed FAIR and reinstituted commodity programs. A review of price policy effectiveness was scheduled for 2008. Market intervention in farm incomes and pricing thus have been the central but far from only concern of federal policy makers for over three-quarters of a century.

AN EXPANDED AGRICULTURAL POLICY AGENDA

Even if market intervention, or price policy, remains the central concern of federal officials, that focus is difficult to maintain. Trade-offs are necessary. As farm voters diminish in number, as the comparative economic contribution of agriculture shrinks, and as non-farm citizens expect greater federal attention to other issues of food and fiber production, agricultural officials expand their policy agenda. Omnibus farm bills and the already extensive base of agricultural institutions make that possible, through simple accommodation.^[10]

The regulatory era of agricultural policy instituted programs to inspect meat-packing plants, set standards for food processing, and protect against manipulative pricing and food contamination by middle market businesses that brought products to consumers. Current policies extend these efforts and bring federal agencies into a review of emerging citizen worries, such as pesticide contamination and genetically engineered crops. Thus, much of the ongoing work of agricultural policy agencies is evolutionary in detail and politically responsive to shifting public opinion.

As are all public agencies, however, agricultural officials are often charged with having less than total loyalty to new agenda items and non-traditional clientele. Often, new legislation must be initiated to legitimize agency actions and overcome resistance. Omnibus farm bills have been expansive; statutes grew in length from a few dozen pages in the 1960s to over 700 in 1990. These have added important dimensions to what was once economic policy.^[11]

In 1964, the provision of food stamps to low-income Americans for use in making retail purchases was made a “permanent” agricultural agency responsibility. Supplemental assistance to low-income children and mothers followed in later years, as did a renewed USDA emphasis on nutrition. The 1973 Agriculture and Consumer Protection Act responded to twin political realities: inflation and consumers. Basic price program features were remixed to provide more direct payments to farmers, keep food prices low, and expand production with overseas markets in mind. After 1973, both consumer matters and international trade became ever more important components of agricultural policy, particularly in efforts to determine which user preferences increased product sales. Environmental advocates turned considerable attention to the farm bill in 1985, notably in preserving prairies and wetlands. As that bill passed, it was clear that environmental interests had attached themselves to existing soil and water programs and became long-term partners in policy making. Irrigation use, the release of genetically engineered products, safe food, erosion, and groundwater contamination all became ongoing issues. In sum, a variety of social causes, all of which intermingle, are now enmeshed in the economics of commercial farming and food production.

CONCLUSION

Today’s U.S. agricultural policy should be understood as general social policy, taking place in a global economy. In that economy, America is a huge food exporter and gigantic food importer. Agricultural policy in that context struggles with three problems: continued fostering of U.S. commercial production by large-scale farms, developing commercially viable producers of organic and sustainable farms that satisfy non-economic public food wants, and integrating often poorly informed social values about food safety and health into economic policies of production and trade. Integration is the critical challenge: integrating sound trade practices that ensure worldwide environmental

standards in producing safe foods; integrating USDA and other agricultural institutions with the interrelated policies of the Food and Drug Administration and the Environmental Protection Agency; and integrating organic and sustainable producers, as favored by the public, into a dominant system of large-scale producers and into the commercially directed Agricultural Establishment.

Alternative Dispute Resolution Processes

Tina Nabatchi

Lisa B. Bingham

*School of Public and Environmental Affairs, Indiana University,
Bloomington, Indiana, U.S.A.*

INTRODUCTION

This chapter explores the basics of alternative dispute resolution (ADR). The chapter begins by defining ADR and examining its use in the public sector. It then discusses several processes within each of the three categories along the ADR continuum: unassisted negotiation, consensus-building, and quasi-adjudication.

WHAT IS ADR AND WHY IS IT USED IN THE PUBLIC SECTOR?

Alternative dispute resolution (ADR), also called appropriate dispute resolution, is an umbrella term for a wide variety of conflict management techniques and processes used in lieu of traditional judicial and administrative adjudication. In general, ADR processes are voluntary, and most use a third party neutral, such as a facilitator, mediator, or arbitrator. ADR processes are designed to resolve disputes in a faster, less expensive, and more amicable manner, and because the processes are less adversarial and formal than traditional litigation, ADR is often able to preserve, and sometimes strengthen, the relationships of the disputing parties. Today, ADR processes are used at all levels of government to resolve a wide variety of public sector disputes (see [Table 1](#) for a list of government ADR web resources).

In the 1990s, several legislative acts incorporated ADR into all three branches of the federal government. The Civil Justice Reform Act of 1990 [28 U.S.C. §§ 471–482 (1994)] and the Alternative Dispute Resolution Act of 1998 [28 U.S.C. §§ 651–658 (Suppl. IV 1998)] brought ADR into the federal judicial branch. Legislative agencies were instructed to use ADR for employment disputes by the Congressional Accountability Act of 1995 [Public Law 104-1]. Executive branch agencies were encouraged to use ADR when Congress passed the Negotiated Rulemaking Act (NRA) of 1990 [5 U.S.C. §§ 561–570] and the Administrative Dispute Resolution Act (ADRA) of 1990 [Public Law 101-552 (codified in scattered

sections of 5 U. S. C. and 9 U.S.C.)], as amendments to the federal Administrative Procedure Act (APA) [5 U.S.C. § 553]. The ADRA and the NRA were amended in 1996, making ADR and negotiated rule-making permanent fixtures in federal agencies.^[1,2]

State agencies derive their authority to use ADR from three sources. First, agencies may infer authority from the state Administrative Procedures Act (APA), which often provides for informal proceedings and the resolution of complaints by settlement.^[3] Second, agencies may imply authority from a general enabling statute that gives them the power to enter into contracts.^[3] Third, some state legislatures have passed statutes expressly authorizing state, and sometimes local, governments to use ADR and/or negotiated rulemaking.

Local governments and municipalities have also exercised their inherent police powers and budgetary and legislative authority to use ADR. Often, they collaborate with local community mediation programs, non-profit organizations with volunteers who are available to mediate typical neighborhood disputes.

Given the proliferation ADR legislation, such processes are now being used to address a wide variety of public sector disputes. ADR processes are used to resolve intra-agency disputes, interagency disputes among government agencies at the same or different levels, and disputes among agencies and private parties. In these contexts, ADR has been used in labor-management disputes, contracting and procurement disputes, regulatory and enforcement disputes, and for claims against the government. The following section of the chapter discusses the broad range of ADR processes that might be used in these different settings.

ADR PROCESSES

ADR processes can be arranged along a continuum ranging from informal, unassisted techniques to more formal adjudicatory arrangements. At one end of the continuum are certain approaches to negotiation; consensual ADR processes involving a third-party neutral fall in the middle of the continuum; and, at the other

Table 1 ADR resources

For resources about ADR use in the federal government, see the Federal ADR Interagency Working Group web site at <http://www.adr.gov>

For resources about ADR use in state government, see the Policy Consensus Initiative (PCI) web site at <http://www.policyconsensus.org>

For resources about ADR use in local government, see the National Association for Community Mediation web site at <http://www.nafcm.org>

For a comprehensive gateway to ADR and conflict resolution resources, see the Conflict Resolution Information Source (CRInfo) web site at <http://www.crinfo.org>

end of the continuum are quasi-adjudicatory processes involving a third-party neutral (see Table 2). Several ADR processes within each of these categories are discussed below.

Unassisted Negotiation

Although they do not require the use of a third-party neutral, certain approaches to negotiation, specifically principled or interest-based negotiation and partnering, fall on the ADR continuum.

Principled or interest-based negotiation

The terms principled negotiation and interest-based bargaining were developed to represent negotiation approaches that stand in contrast to traditional positional bargaining.^[4] Positional bargaining, also called win-lose, competitive, or adversarial negotiation, is relatively confrontational; the disputing parties take sides (positions) and argue in such a manner as to prevail over the other. Conversely, principled or interest-based negotiation is relatively cooperative; the disputing parties seek a solution that is mutually beneficial. There are four steps in principled negotiation:

1) separate people from the problem; 2) focus on interests, not positions; 3) invent options for mutual gain; and 4) use objective criteria to assess possible solutions.^[4] The goal of principled negotiation is to find a solution that will meet the needs and interests of all parties in the dispute.

Partnering

Partnering is a relatively new ADR process developed by agencies for use in the area of procurement and government contracting. Partnering is intended to help avoid the occurrence of disputes by building strong, collaborative working relationships among the contracting parties before disputes arise. The goal is to establish channels of communication that are immediately used at the first sign of a dispute in order to catch and resolve potential problems before they become real disputes and to reduce the need for litigation in the future.^[3]

Consensual Processes Involving a Third-Party Neutral

Consensus-building or consensus-based processes describe a number of collaborative decision-making techniques in which a third-party neutral assists diverse or competing interest groups in reaching an agreement about the issues in conflict.^[5] These processes are typically used to foster dialogue, clarify areas of agreement, improve the information on which decisions are based, and resolve controversial issues in ways that all parties find acceptable. The most common consensus-based processes are conflict assessment or convening, facilitation, mediation, conciliation, negotiated rulemaking, and policy dialogues. In addition, there are processes intended to result in consensus that have adjudicatory elements, such as early neutral evaluation, minitrial, and summary jury trial. These processes supply the disputing parties with an expert

Table 2 The continuum of ADR process

Unassisted negotiation	Consensual process	Quasi-adjudicatory process
Principled or interest-based negotiation	Conflict assessment (convening)	Fact-finding
Partnering	Facilitation	Settlement judges
	Mediation	Private judges
	Conciliation	Arbitration
	Negotiated rulemaking	Med-arb
	Policy dialogues	
	Early neutral evaluation	
	Minitrial	
	Summary jury trial	

opinion about the merits of their case and furnish more information about their best alternative to a negotiated agreement (BATNA). This, in turn, can provide the disputants with a loop-back to negotiation. In all of the consensus building processes, the third party has no power to impose a settlement on the disputing parties, but rather simply aids the parties in reaching an agreement. The differences among these consensus-based processes stem from the third party's degree of activism in the dispute.

Conflict assessment (convening)

Conflict assessment, also known as convening, can be a valuable first step in many ADR processes. The assessment process begins with a discussion among potential stakeholders to evaluate the causes of the conflict and identify the entities and individuals who would be substantively affected by the outcome of the conflict. Next, the interests and needs of the stakeholders are assessed, a preliminary set of relevant issues is identified for discussion, and the feasibility of using various collaborative ADR processes to address the dispute is evaluated. In the final step, often called process design, the neutral recommends and assists in developing an appropriate ADR technique for addressing the dispute.

Facilitation

Facilitation is a collaborative process in which a neutral assists a group of stakeholders in constructively discussing the issues in controversy. The facilitator typically works with participants before and during discussions to assure that appropriate persons are at the table. The facilitator also helps the parties set and enforce the ground rules and agendas, assists the parties in effectively communicating, and helps keep them on track and working toward their goals. Facilitation is commonly used in negotiated rulemaking and to help resolve complex environmental or public disputes; however, the process may work in any number of situations where parties of diverse interests or experience are in discussion.

Mediation

Mediation, one of the oldest forms of conflict resolution and the most common ADR process used in the federal government, is a style of facilitated negotiation, where a skilled, impartial third party assists disputants in reaching a voluntary, mutually agreeable resolution to all or some of the disputed issues.^[5] The mediator works with disputants to help them analyze the conflict, improve communication, identify interests, and explore possibilities for a mutually agreeable resolution. The mediator lacks power to impose any solution;

instead he/she assists the disputants in designing their own solution. Typically, this involves supervising the bargaining, helping the disputants find areas of common ground and understand their alternatives, offering possible solutions, and helping parties draft a final settlement agreement. Mediation usually occurs in the context of a specific dispute involving a limited number of parties; however, mediation procedures are also employed to develop broad policies or regulatory mandates and may involve dozens of participants who represent a variety of interests. Mediation is most often a voluntary process, but court orders or statutes mandate its use in some jurisdictions.

Conciliation

Conciliation involves efforts by a third party to improve the relationship between two or more disputants. Generally, the third party will work with the disputants to correct misunderstandings, reduce fear and distrust, and improve communication. The term conciliation was used in the early 20th century to refer to labor-management mediation, and was later used in Title VII of the Civil Rights Act of 1964 to refer to settlement efforts conducted by an investigator in the Equal Employment Opportunity Commission (EEOC) after reasonable cause to believe that discrimination under the Act has occurred.^[3] Today, conciliation is often used to prepare disputants for a future ADR process, and can also be used as a synonym for mediation.

Negotiated rulemaking

Negotiated rulemaking, also known as regulatory negotiation or reg-neg, involves efforts by regulatory agencies to design regulations by negotiating with interested stakeholders.^[6] In this multiparty process, a negotiating committee consisting of the rulemaking agency and interested stakeholders seeks to reach agreement on the substance of a proposed rule, policy, or standard. The purpose and intent of negotiated rulemaking is to avoid the litigation that may arise to challenge the new rule by generating agreement among the affected interests so that they abide by the decision and its implementation. Federal law requires a thorough conflict assessment before the use of reg-neg and the involvement and assistance of a skilled, neutral mediator or facilitator during the process.

Policy dialog

Policy dialogues are a relatively new form of ADR that are generally used to address complex environmental conflicts or public-policy disputes. In this process, representatives of groups with divergent views or interests are assembled to explore and discuss the

issues in controversy. Unlike many other consensus-based ADR processes, policy dialogues usually do not seek to achieve a full, specific agreement. Rather, participants seek to assess the potential for developing a full consensus resolution at some later time or may put forward general, non-binding recommendations or broad policy preferences for an agency (or other governmental entity) to consider in its subsequent decision making.

Early neutral evaluation

Early neutral evaluation (ENE) is a service often initially performed informally by mediators. In this process, a third-party neutral, usually someone with specifically relevant legal, substantive, or technical expertise, hears informal evidence and arguments from all the parties involved in the dispute and issues a non-binding report advising parties about the strengths and weaknesses of their cases.^[3] The report may also evaluate the likely reaction of a judge or jury if settlement is not reached, provide guidance about appropriate range of outcomes, and assist the parties with narrowing the areas of disagreement or identifying information that may enhance the chances of settlement.

Minitrials and summary jury trials

Minitrials and summary jury trials are commonly used to resolve litigation over complex environmental or public issues. In a minitrial, parties are generally represented by a counsel and an agent with the authority to agree to a settlement or decision, e.g., a CEO or agency official. Abbreviated versions of the evidence and arguments are presented, after which the decision-making representatives attempt to negotiate a settlement.^[3] In a summary jury trial, the disputing parties impanel a jury and present short versions of the evidence and arguments. The jury deliberates and makes findings of fact and liability when appropriate, which are then released by the judge.^[3] The parties are not bound by the jury's findings, but rather use the information to assist with settlement negotiations. Minitrials and summary jury trials are alike in that they both serve as a loop-back to future negotiations.

Quasi-Adjudicatory Process Involving a Third-Party Neutral

There are a broad range of ADR processes that resemble administrative agency adjudication. These processes can be non-binding, with a decision that is advisory only and may serve as a loop-back to negotiation, or binding, with a decision that is final and enforceable by the courts. Some of the most common

quasi-adjudicatory processes are fact-finding, settlement judges, private judges, arbitration, and med-arb.

Fact-finding

In this process, the neutral, called a fact finder, receives information and listens to arguments presented by the disputants. The fact finder, who may conduct additional research to investigate the issues in dispute, evaluates the evidence and submits a report that contains findings of fact and sometimes recommendations based on those findings.^[3] Typically, this informal, non-binding process is used in cases where the disputed facts involve highly technical scientific or engineering issues, thus requiring the fact finder to have subject-matter expertise.

Settlement judges

Settlement judges are used for litigation that has already reached administrative adjudication. In this process, a judge, who is different from the presiding judge in the case, acts as a mediator or neutral evaluator and meets both separately and jointly with the parties to find a mutually agreeable solution.^[3] If the efforts of the settlement judge do not produce full agreement, the case returns to the presiding judge. A settlement judge often plays a more authoritative role than a private mediator, by sometimes providing parties with specific, non-binding legal or substantive information and recommendations.

Private judges

Private judging is similar to both settlement judging and arbitration, and is used for cases that have already reached adjudication. In a private-judging process, sometimes called rent-a-judge, the disputing parties or the courts empower a private person, usually a retired judge or magistrate with special expertise, to hear and decide their case after private proceedings.^[7] The private judge acts as an adjudicator and issues a binding decision based on both fact and law.

Arbitration

Arbitration is a quasi-adjudicatory process where the disputants present their case to an impartial third party, who then issues an opinion. Arbitration may be of rights or interests. Rights arbitration is retrospective; the issues involve an existing contract that one party claims the other has breached. Interest arbitration is prospective; the issues involve the determination of entitlements under some future contract. Arbitration has been used in both unionized and non-unionized labor settings, where it is referred to

as rights arbitration, grievance arbitration, interest arbitration, employment arbitration, and final-offer or baseball arbitration.^[8] The success of arbitration in labor relations has led to its use in commercial settings. Commercial arbitration is used for disputes involving architectural, construction, consumer, and sales contracts, as well as for divorce, environmental, and other disputes.

In all forms arbitration, neither the decision-maker nor the parties are bound by the rules of evidence used in a court of law. However, the hearings themselves generally follow the steps of adjudication: the parties make opening statements; the party with the burden of proof presents its case, then the other party presents a rebuttal; witnesses may be cross-examined and the parties may make closing statements or present briefs arguing their cases.

Med-arb

Med-arb is a relatively new procedure in which a neutral first mediates the case, and if that fails, then goes on to arbitrate the dispute. Sometimes the same neutral mediates and arbitrates the case; at other times different neutrals act as the mediator and arbitrator. In this latter variation, the mediator and arbitrator may or may not be in contact, and the arbitrator may or may not consider the mediator's comments and recommendations.

CONCLUSION

The emergence and proliferation of ADR is one of the most significant movements in U.S. law in the latter half of the 20th century and has had profound effects

on the way the government and public administrators handle conflicts. The institutionalization of ADR in administrative agencies demonstrates both innovation and a concern toward amicable resolution of public disputes. The use of ADR in the public sector will continue to grow as governments recognize the potential of these processes to resolve disputes in a faster, less expensive, and more amicable manner, and as public managers develop expertise in using these processes in decision- and policy-making activities.

Annexation

Jered B. Carr

Department of Political Science, Wayne State University, Detroit, Michigan, U.S.A.

Richard C. Feiock

Askew School of Public Administration and Policy, Florida State University, Tallahassee, Florida, U.S.A.

INTRODUCTION

Annexation is the legal process whereby a municipality adds land, and usually population, to its jurisdiction. In some instances, these actions enable the provision of entirely new services to the territories annexed; in others, they enable higher levels of already-existing services; and yet in others, the level and mix of public services do not change, but the responsibility for providing these services is transferred from another jurisdiction such as a township, a county, or a special district government to a municipal government.

Although annexation involves the extension of the entire institution of municipal government, it is the expansion of city services that typically receives the most attention. The key role service provision plays in annexation cannot be overstated. Annexation is a process that, in many instances, proceeds literally property by property, as services are exchanged for city residence. As the most tangible benefit offered to suburban residents, city services are an inducement used by the city to encourage suburban property owners to join the city. Consequently, annexation issues revolve around service provision and the revenues necessary to pay for them. In some instances, municipal boundary expansion may result in one jurisdiction seizing another's revenue base. When officials from other local governments oppose annexation proposals, it is usually because of the effect of these annexations on their jurisdiction's ability, real or perceived, to fund current and future service levels.

Given the central role of service provision in annexation, the fiscal impacts of these actions are critical. However, current research has shown that the fiscal impacts of annexation are not well understood.^[1] Few local governments have the time and resources to undertake comprehensive fiscal analyses of annexation activities. Moreover, studies show that annexation is not necessarily a "winner-take-all" process.^[1] Annexation can be fiscally advantageous for both, one, or neither community. Conventional wisdom holds that annexation is fiscally beneficial to the

annexing municipality and fiscally disastrous for the government losing the territory. However, in practice, the fiscal impact of annexations is far more complex.

KEY STAKEHOLDERS IN ANNEXATION

Despite the key roles that service provision and financing play in municipal annexation, the racial and income disparities present in communities also influence annexation patterns. Numerous accounts have chronicled the ways in which annexation has been used to intentionally alter the racial composition of cities, and, conversely, how cities have refrained from annexing areas comprised largely of racial minorities or low-income populations.^[2] Importantly, the full effects of municipal annexation on the racial composition of a community may become obvious only when annexations are viewed on a cumulative basis.^[3,4]

Three stakeholders are most often at the center of municipal annexation activity: municipal officials, suburban residents, and the officials of other local governments. In some instances, city residents and state legislators may also become important players in these actions. Whether these stakeholders choose to become involved in a proposed annexation depends on the incentives created by the characteristics (e.g., land area, population demographics, and land use) of the specific parcel considered for annexation, by how revenue sources and functional responsibilities are distributed among the local governments in the area, and by how difficult state annexation laws make their participation in the action. The role played by state laws in affecting the participation of the different stakeholders is discussed in detail in the following section.

Municipal Officials

Municipal officials in cities experiencing population growth and urbanization on their periphery will often view boundary expansion through annexation as

desirable. The thinning and sorting of population that goes on in most urban areas works to diminish the revenue capacity of central cities, while also increasing the demand and need for public services in these cities. The availability of cheaper land, new housing, lower densities, and suburban amenities encourage population dispersion and distribution throughout the metropolitan area. Deterioration of neighborhoods, decreased personal safety, and the widespread apprehension regarding low-income and minority group members all help to push affluent citizens to new residences in areas lying outside the city. Annexation is often seen as an important instrument by which municipal officials can maintain the city's economic base.^[5]

Despite the attractiveness of annexation to municipal officials, whether it makes fiscal sense for a city is often unclear. Annexation may appear to be in the long-term fiscal interests of cities, by expanding the property tax base and increasing revenues from user fees, utility charges, and sales taxes. Yet, in the short term, annexation can result in tremendous capital costs for the extension of services to new residents. Thus, while the annexed area may provide a fiscal surplus, it may also constrain policy options in the short run and affect the ability of a city to undertake other initiatives for years to come.^[6] Even in the longer term, annexation may not prove to be in the fiscal interests of the annexing municipality. For instance, annexation may capture revenues from increased commercial development of the periphery of the municipality, but along with these gains may come increased costs from traffic congestion and infrastructure provision and maintenance.^[1]

State revenue-sharing programs are often an important motivating factor behind municipal expansion, especially where revenue distribution is linked to population or the location of revenue generation. Consequently, city officials may seek to annex territory less for its value in terms of property tax base than for the intergovernmental revenues attached to the area's population and the sales or income tax potential of its businesses.

The extension of municipal boundaries may reduce the costs of service provision borne by current city residents in two different ways. First, the additional customers provided through annexation may lead to lower unit costs produced by economies of scale. Second, annexation expands the base of taxable property that can be tapped to support municipal services. City residents may also see annexation as a way to achieve fiscal equivalence in the wider community. The city's infrastructure and services often directly or indirectly affect residents of bordering unincorporated areas. Thus, annexation can be a means to bring property owners into the municipality

who were previously benefiting from these services at no cost.

However, annexed residents also have the right to participate in municipal elections. Adding a pool of new voters to the city can be controversial, and some city residents may oppose a proposed annexation because of its potential effect on municipal elections. In contrast, race has also been cited as the motivation behind the annexing of White suburban residents. In these instances, city officials have been accused of using annexation to add White population to a city that is nearing a majority-minority status.^[2] Empirical analyses of state annexation patterns have linked reductions in the number of Black elected office-holders to aggressive annexation by communities.^[4]

Suburban Residents

The incentives of suburban residents are less clear than those of city officials. Annexation can be a way to satisfy unmet service demands in these areas and, thus, may be viewed as a means to expand the scope and quality of public services and to increase property values. However, while suburban residents may benefit from the extension of most services and infrastructure, they may instead prefer lower tax and service levels.^[6] Also, suburban residents may resist annexation because they want to maintain the status quo of benefiting from city services and infrastructure at no cost. For example, suburbanites enjoy the benefits of the city's cultural amenities and physical infrastructure at no cost. In addition, some city services have regional effects, such as economic development and urban planning. Annexation can prevent suburban residents from exploiting the central city by imposing marginal costs without full repayment in terms of taxes, fees, or charges.

Even where suburban residents do not seek to "free ride" on city taxpayers, they may still resist annexation because they oppose having to share in the costs of redistributive services that they see as primarily benefiting inner-city residents. Ostensibly, city officials are motivated to add properties that cost less, to support in services, than they generate in tax revenue. This logic is usually apparent to suburban residents as well. Thus, the city must be able to convince them that services through the city will cost less than their other options.

Finally, for a variety of reasons, people within suburban areas and cities sort themselves in many ways. Members of different income groups tend to congregate to form relatively homogeneous communities, both inside and outside of cities. Suburban residents may resist annexation to preserve the "character" of

their community, which they may define in various ways. Numerous anecdotal accounts exist of suburban residents resisting annexation to a city with substantial minority or poor populations. In other instances, opposition may be based on preserving area qualities, such as the rural nature of the neighborhood or low-density development.

Officials from Other Local Governments

The way that officials from local governments outside the annexing city view annexation depends greatly on how functional responsibilities have been divided among the local governments in the community. Conventional wisdom suggests that annexation is a zero-sum game and that the other local governments in the region will always see expansion by neighboring jurisdictions as a threat to their own long-term viability. This is not always the case. In some instances, the annexation of the property displaces a service provider, such as a township, a county, or a special district government. The other local government may strongly oppose annexation to the city because the other government may suffer a loss of revenue from property and/or sales taxes. For example, opposition by county officials is more likely, where county governments have made a significant commitment to providing municipal-level services to the unincorporated areas of the county.^[7] However, in other instances, annexations may involve the acquisition of territory not previously receiving the services in question. The municipal expansion simply adds another layer of government with fundamentally different responsibilities to the property, and no government is displaced. In this situation, other local governments may even support annexation to the city.

STATE STATUTORY REGIMES

State restrictions on local government powers are embodied in Dillon's rule, which holds that local governments are "creatures of the state." As such, local government authority has to be granted by the state constitution or by legislative acts.

For states, the fundamental question is whether annexation is a technical exercise of matching political jurisdictions to service-delivery boundaries, an exercise in political association, or both. State legislatures have generally decided that annexation has elements of both, although they have balanced these two roles in different ways. The different ways that states have resolved this balance has been effectively captured by the Sengstock's classification of annexation laws.^[8] This five-part typology groups state

annexation laws in terms of where the key decision-making authority is placed. It effectively answers the question: Of the three stakeholder groups described in the previous section, which one holds the balance of power to authorize annexations? Generally, each stakeholder has a role in the proceedings, but state law puts one in the favored position where the stakeholder's consent is required for annexation to occur. Given that this diverse set of actors may have different preferences for jurisdictional lines, the inclusion or exclusion of particular actors is expected to have important consequences for annexation activity.^[9]

Regardless of whether it is explicitly stated, all state statutory regimes begin with the presumption that municipalities will generally seek to expand their boundaries. Some states provide municipalities with the authority to expand their boundaries essentially at will, trusting that city officials will not abuse this discretion and expand only where necessary, to ensure efficient and equitable service delivery for the population in the area. Other state legislatures do not display the same level of confidence in municipal governments and require cities to obtain the permission of property owners before expanding. Yet others require that a third party make the decision, apparently trusting neither of the directly affected parties to rise above their own narrow interests on this issue.

Municipal Determination

In these states, municipal governments are authorized to extend their boundaries by the unilateral action of their governing bodies, typically by passing a municipal ordinance annexing the territory. States typically permit unilateral action only if the territory to be annexed meets specific requirements for urban character, such as contiguity, density, or extent of subdivision.^[10] Some states also require that annexation be addressed in a comprehensive plan or overall strategy for annexation. Finally, states that allow unilateral annexation often stipulate that municipalities must produce service plans setting out the timetable for extension of services to the annexed territory.

Popular Determination

Under this approach, the affected electorate or property owners have the right to vote to determine if a municipal boundary change will take place. This approach is rooted in the philosophy that property owners should be able to choose the jurisdiction in which they live, not the other way around. Electors and property owners can grant approval by initiating annexation with a petition signed by a majority of

electors and/or property owners in the territory to be annexed, by referendum or by written permission filed subsequent to a municipality's decision to pass an annexation ordinance or resolution.^[10] In a few cases, a majority of electors and/or property owners have the power to veto an annexation action by petition or by filing written objections.^[10]

Among popular determination states, there are differences with regard to who may vote in annexation referenda. Generally, only the electorate and/or property owners within an area proposed for annexation are allowed to vote on a proposed action. However, in some states, the electors of the municipality may also vote. In a few states, the electors of the diminished territory, typically a county or township government, are also empowered to vote on the action. Referenda commonly require only a simple majority for approval. In cases where the electors of the city are empowered to vote, the two elections and results are usually considered separately, and double majorities are required to approve annexation. Importantly, many states also have provisions that permit annexation to occur without a referendum of property owners. In those instances, where a super-majority of electors or property owners initiate annexation, all referenda requirements are generally waived. Depending on the state, a super-majority of 75% or 100% may be required to avoid the referendum provision.^[10]

Judicial Determination

The final three categories represent different approaches to empowering third parties to approve annexations. The first of these third parties is the judiciary. In some states, courts are empowered to determine if an annexation may proceed, using guidelines and criteria established by the legislature. However, court review is usually limited to procedural or statutory compliance issues. Legislative guidelines usually do not empower courts to assess substantive issues, such as the prudence or equity of annexation, or to consider adverse fiscal impact on other local governments.^[10]

Legislative Determination

The second third party authorized to approve annexations is the state legislature. Because legislatures have the power to create annexation statutes, this is more accurately viewed as the legislature simply retaining this authority. This approach is found most often in states that are highly urbanized and, therefore, possess little remaining unincorporated territory. For example, the states of New England typically do not

have general statutes outlining the process for annexing unincorporated territory, because they lack unincorporated territory. Annexation in these states requires deannexing property from one municipality and annexing it to another.^[10] In addition, in states where annexation procedures are too burdensome or non-existent, municipal boundary changes may be made by special act of the state legislature.

Importantly, this approach provides a forum for other local government officials to participate in these decisions. Although the entire legislature must act on the annexation proposal, typically these local bills will not be put before the entire body until a consensus within the local delegation is achieved. The local delegation is unlikely to act, and therefore annexation will not occur, where there is conflict among the local governments about the proposed annexation.

Quasilegislative Determination

Finally, some states use independent, non-judicial boards or tribunals to determine whether a proposed municipal annexation will occur. This approach provides for a more direct role by other local governments in annexation policy. Most states that use this approach provide for local commissions that consist of various local officials from within a county or group of counties. A few states have state boards with members appointed by the governor.^[10]

PATTERNS OF ANNEXATION ACTIVITY ACROSS THE STATES

State annexation laws affect annexation patterns by providing incentives and disincentives for participation by key stakeholder groups.^[7] The specific procedural constraints outlined in these laws make some options harder to achieve than others, because some provisions necessitate the coordination of greater numbers of people. For example, rules requiring referenda and majority approval by property owners and/or city residents impose collective action barriers to effecting annexation, as proponents must circulate petitions and/or get their supporters to the polls. In contrast, where state law permits boundaries to be extended by the unilateral action of municipal officials, no collective action is required. The need to act collectively to expand municipal boundaries means that those groups better able to organize and sustain these actions will be favored in the process. Consequently, local boundaries will often be drawn to match the preference of those groups that have an advantage under the procedure. [Table 1](#) provides a listing of municipal annexation activity ranked by state.

Annexation as Strategic Action

Despite the widespread usage of the Sengstock typology to classify annexation laws, state annexation regimes often do not fit into a single Sengstock classification but, instead, have elements of two or more different types.^[10] For instance, many states permit annexation to be initiated by municipalities and property owners.^[10] Multiple state procedures create opportunities for stakeholders to manage the scope of conflict. As Schattschneider recognized in 1960, the outcome of any conflict is determined by the extent to which the audience becomes involved in it.^[11] “Every change in the number of participants is about something, that the newcomers have sympathies or antipathies that make it possible to involve them. By definition, the intervening bystanders are not neutral” (on page 4 of Ref.^[11]).

In the past few years, scholars of municipal annexation have begun to recognize the limitations of the Sengstock framework and produce studies focusing, instead, on determining the effects of specific provisions on annexation patterns. In 2006, Facer examined 15 separate provisions of state annexation law on seven different measures of annexation activity.^[12] He found that provisions designed to facilitate annexations were indeed linked to higher levels of annexation activity. Provisions permitting property owners to initiate annexation proceedings, those establishing special processes for preventing or eliminating “unincorporated islands,” and those enabling the annexation of non-contiguous lands had the largest stimulating effects on the level and extent of territory and population annexed.^[12]

However, these studies show that provisions such as requirements for referenda on annexation proposals, which are expected to raise the costs of collective action and therefore reduce annexation activity, instead, appear to increase the likelihood of these actions. Carr and Feiock's 2001 study showed that states with referenda requirements had substantially more annexations than the states not imposing this

constraint.^[7] Similarly, Facer's analysis showed that states using a referendum requirement had almost twice as many annexations as states not requiring a referendum on annexation proposals.^[12] One explanation for these findings is that because many states have created multiple procedures for municipal annexation, those that seek annexation are able to strategically select the arena (i.e., annexation procedure) in which they are most likely to be successful. In other words, they are able to choose the annexation path of least resistance, given their resources and objectives. Most often, the path of least resistance is annexation on a small scale.

For example, many states have created provisions that enable annexations to occur without a referendum if all the property owners in the targeted area agree to the annexation.^[10] These procedures enable municipal officials to exclude city residents, county officials, and all the other suburban property owners in the immediate area from the annexation decision. Consequently, efforts by municipal officials to manage the scope of conflict have led cities to annex literally property owner by property owner. Although large-scale annexations do occur, they are comparatively rare. Not only do annexations effected under these procedures exclude other stakeholders, but also, because of their small scale, these actions go relatively unnoticed in the wider community.

The fact that annexation proponents act strategically underscores the importance of thinking about municipal annexation not only in terms of measures of scale, such as population and territory annexed, but also in terms of the frequency of these actions (Table 2). For years, an overly narrow focus on measures of scale led scholars to mistakenly conclude that the annexation law in a state was far more restrictive than it was in practice. Requirements for referenda were viewed as making annexation nearly impossible; yet, recent studies show that this conclusion is wrong.^[7,14] It appears that many annexations occur through processes that are able to circumvent the more restrictive provisions.

From State annexation data compiled from the U.S. Census Bureau's Boundary Adjustment Survey.

MUNICIPAL ANNEXATION RESEARCH: KEY QUESTIONS FOR THE TWENTY-FIRST CENTURY

Three aspects of annexation policy are likely to receive significant attention in the future. First, all the actors affected by annexation, whether city officials, suburban residents, or interested third parties, have various mechanisms at their disposal to achieve their service-delivery objectives. In previous years, suburban residents could obtain municipal-level services only by joining a municipal government, either through annexation to an existing municipality or through the formation of a new city government. Many states now empower counties and special districts to offer services directly competing with municipal governments.^[15] Similarly, municipal governments once had to annex suburban properties to provide services to them, but now many states permit municipal governments to provide services to properties beyond their borders.^[13] Others permit one or more local governments to enter into agreements that effectively transfer land from one unit to another for a specified period of time, thereby obviating the subject of annexation.^[14] Thus, studies of annexation policy must recognize that the benefits of annexation may be met in a variety of ways and conceptualize annexation as one instrument among many.

Second, it is likely that scholars of annexation will produce better and better analyses of the consequences of state annexation laws on the patterns of annexation observed in the states. As already noted, annexation policy is a complex topic involving multiple state laws and strategic behavior by participants. Policymakers and academics alike have an important stake in understanding how key provisions such as referendum requirements, service plans, and the use of boundary commissions effect annexation patterns.

Finally, concerns over the effects of urban sprawl on the fiscal health of central cities have led to renewed calls for regional government in our urban areas. Advocates of annexation, such as Rusk, argue that cities able to annex suburb properties are fiscally stronger than

those cities unable to expand their boundaries.^[16] They contend that annexing land is an important route to economic health and development of urban areas. However, for much of the latter part of the 20th century, many state legislatures created annexation laws giving property owners greater control over annexation decisions.^[10] This trend coincided with a more general movement, aimed at providing suburban property owners with more choices in service provision. The intense debate in the United States over the appropriate role of annexation policy in the fiscal health of our urban communities will likely continue in the 21st century.

Appearance of Impropriety

Stuart C. Gilman

Ethics Resource Center, Washington, District of Columbia, U.S.A.

INTRODUCTION

One of the most controversial concepts in public service ethics is the notion of the appearance of impropriety. Whereas few would question the evil of impropriety in carrying out one's public duties, many have great difficulty with the modifier "appearance." After all, some might argue, cannot any action be falsely perceived? Does not the appearance standard leave anyone open to attacks by the most excessive elements of the community? Is not appearance an excuse for subjective extremism? Even if all these questions are answered affirmatively, reality for those who serve the public is that the appearance of impropriety is a critical standard by which to evaluate public officials. Yet, at the end of the day, it might be the most important standard by which to judge the actions of public officials.

Appearance standards are not limited to public administrators, but also extend to legislators and judges. In fact, many professional associations, such as the American Society for Public Administration, the International City/County Managers Association, and the Association of Government Accountants, have codes that have appearance as one element. Recently, the appearance of impropriety has even been raised for private-sector companies whose multiple business lines seem to conflict with each other (e.g., public auditing companies and their consulting firms).

Appearance standards are all derived from the English Common Law Standard of the Common Man Rule, or in its modern incarnation the Prudent Person Rule:

Historically known as the prudent or reasonable man rule, this standard does not mandate an individual to possess exceptional or uncanny investment skill. It requires only that a fiduciary exercise discretion and average intelligence in making investments that would be generally acceptable as sound.^[1]

The Prudent Person Rule provides a model test: Would a reasonable person armed with all the facts conclude that an action or inaction was inappropriate?

TOWARD A DEFINITION

Appearance of a conflict of interest, appearance of the loss of impartiality, and appearance of impropriety

often are used interchangeably. Although some might claim that it is valuable to refine the differences among them, for our purposes these concepts are synonymous. A claim can be made that conflicts of interest are a subset of impropriety; however, in applied, practical cases it is almost impossible to support the distinction. Andrew Stark has argued that appearance of impropriety can either take "a factual or a normative caste (or sometimes both). Either (a) it *looks* like the official did something wrong or (b) the official did something that *looks* wrong" (Ref.^[2], p. 328). In other words, an official's action is questioned; however, no law was broken and no broadly agreed-on mores were violated. Instead, people feel there should have been a law against the action (or result), or it should be defined as an actually improper action (or result).

On a number of levels such judgments seem unfair. They are prejudiced (decided before the facts are actually known) and also seem to smack of ex post facto laws (laws made after the action). Following Stark's argument, in civil matters such standards of legal fairness are excessive because they assume protections inherent in criminal prosecutions (e.g., innocence until proven guilty). In the vast majority of cases, appearance issues do not rise to criminal standards. Most often, they are punished either politically or administratively, with the most extreme penalty being removal from office. In addition, we assume that public officials will be held to supererogatory standards, thereby justifying the public's trust.

Another argument against an appearance standard is that it rests on knowing one's intention. Former Senator Alan Cranston, reprimanded by the U.S. Senate for his role in the Keating Five Case, claimed that no one knew what he was thinking when he acted.^[3] The only real person who can judge is the senator himself. "You were not there. I was. And I know that what I knew at the time ... convinced me that my [actions] were appropriate."^[4] However, there are always mixed motives in anyone's actions. Simply saying the behaviors were not viewed as intended is not enough. Therefore, as Dennis Thompson pointed out, "because appearances are often the only window that citizens have on official conduct, rejecting the appearance standard is tantamount to denying democratic accountability."^[4]

In a democracy, it seems reasonable to hold public officials to standards that average citizens might not apply for their own behavior. An official has an obligation to do the “right thing” and also to sustain the confidence of the people in governmental institutions. It is important that officials not do one or the other, but do both. This is the double standard to which most democracies hold their officials. It might be argued that this is true of all types of government. Because information is arguably the one most jealously guarded resource in non-democratic societies, it is almost impossible for citizens to find out about impropriety, much less distinguish between real impropriety and its appearance.

WHY IS “APPEARANCE” A PROBLEM?

Unlike other unethical actions, “appearance” issues seem to violate the usual regulatory standards of clarity and objectivity. However, if we understand appearance not in its juridical form, but as a way of clarifying values, it seems to take on a wholly different character. Where a law, regulation, or rule would emphasize a “bright-line” test of whether you violated the precept, a values approach requires balancing various principles and interests. So, for example, under a regulatory regime a senior official might be limited to a \$25 gift each year from a single source. If an individual receives 1000 gifts worth \$25 or less, it would not violate the rule. However, a reasonable claim can be made that the individual would have violated the *spirit* of the rule. In this sense, the notion of spirit is the view that there are essential values that are a predicate to the rule itself. In this case, individuals seem to be intentionally exploiting the rule for their own benefit and, even more egregiously, consciously circumventing the letter of the law in a way that seems to be purposely abusive.

An additional dimension of appearance is that it is dynamic, often varying with historical tides, scandals, and changing societal mores. For example, the press and public often ignored sexual peccadilloes in the nineteenth century when “affairs of the heart” seemed to be part of the privilege of the ruling class. Well into the twentieth century, both Franklin Roosevelt and Dwight Eisenhower were purported to have long-term relationships with mistresses. Today, the slightest hint of such a relationship would be front-page news.

Other issues that now seem to be clear impropriety, in other historical contexts, seemed to be a mere appearance problem. As late as the early twentieth century, George Washington Plunkitt could claim that the Tammany Hall Democrats were more ethical than the Philadelphia Republicans. Although the Republicans had stolen the zinc roofs from poor houses to enrich themselves, the Democrats only took advantage of

buying land (and making a profit) when they knew some public project, such as a building or bridge, might be built on it. Plunkitt used these examples to distinguish between *honest* and *dishonest* graft.^[5]

The impact of these actions, even if legal at the time, can have a devastating impact on the public confidence in government. Public confidence is always fragile in democracies. Inevitably, revolutions, military coups, and other methods of destroying democratic institutions are justified by the lack of confidence in public institutions. In this way, a reasonable claim can be made that appearance of impropriety can have a far more pernicious impact, because collectively a series of unrelated appearance issues can undermine the most robust democratic institutions. This “death by a thousand cuts” by the appearance of impropriety can lay claim to the destruction of untold numbers of political regimes since the 1800s.

GENERAL RULES

Notions of “conduct unbecoming a civil servant” or “conduct that leads to embarrassment of the service” are some of the more general rules used by government. Without mentioning the word appearance, these general rules can often give wide latitude when it comes to enforcement against actions that are perceived as unethical. However, they are often criticized as overly broad and as license to carry out political or personal vendettas against an individual or a group of individuals. In Great Britain, the Nolan Committee on Standards in Public Life created a series of standards based on either “actual or apparent” violations. These broad principles of behavior expected from government officials include *selflessness, integrity, objectivity, accountability, openness, honesty, and leadership*. Although these are aspirational in terms of any enforcement capability of the committee, they are capable of being administratively enforced within ministries or departments.

In the United States, the courts have supported agency actions against employees for activities that appear to be improper, yet do not violate a specific law. One of the clearest examples comes from the federal court case *Wild v. U.S.*^[6] At the time, the executive branch was operating under the Lyndon Johnson’s *Executive Order 11222* (1965), which allowed each department or agency to develop its own specific standards of conduct, based on the model standards found in the executive order. The U.S. Department of Housing and Urban Development (HUD) had such a set of standards that forbid employees from undertaking activities that could appear to conflict with their jobs.

Lawrence Wild was an employee of HUD who had been dismissed for violating HUD’s code of conduct.

Among other elements, the code prohibited the appearance of official impropriety. Wild had violated this norm through his ownership of private rental units. These were so badly deteriorated that local newspapers noted his official position as a manager with HUD and as a landlord of slum dwellings:

In his defense, Wild had argued that as a matter of fact, the newspaper's impressions were inaccurate: he had either demolished or rehabilitated that vast majority of units in question, and had plans to do the same with the remainder. And in any case, Wild urged, as a normative proposition the appearance standard is "so vague as to fail to provide adequate notice" as to what kind of "off-duty conduct places [an official's] job on the line" (Ref.^[2], pp. 326–327).

The court recognized that the point of the appearance standard is to make certain conduct, not forbidden by regulation, a grounds for removal from federal service.

The appeals court went further in its opinion by arguing that whether an employee actually engaged in misconduct is not as important as whether *he could be perceived of having done so*. The appearance norm itself "adequately conveys its concern that an employee not conduct himself in a way likely to bring public obloquy on HUD."^[6] As the court concluded, the irony of Wild moonlighting as a slum lord while serving as a professional employee of HUD should have allowed him to conclude that his actions would have reduced the public's confidence in the department.

This case illustrates both the appearance of impropriety and some of the appearance concept's fundamental problems. The case allows us to distinguish between actual behavior and the perception of behavior. The perception that an official of an agency committed to upgrading the quality of housing bought slum dwellings was enough for the court to argue that HUD had legitimately fired Wild. Whether his personal actions were ethical, the mantle he carried as a HUD official required him to consider not only his own personal actions, but also the impact of those actions on the public's confidence in his agency's work.

Even if one accepts this as a reasonable line of argument, it is obvious that there are extraordinary impositions on an official's civil liberties and personal freedom. Many government officials are attracted to their agencies because of a passionate interest a particular policy arena: environment, forestry, children's health, etc. One can easily imagine the many circumstances that would lead to appearance issues. Yet, the potential of apparent conflicts of interest might prevent a public employee from buying stock in a particular pharmaceutical company that deals with children's health issues, purchasing public forest land, or even

accepting payment for giving speeches against the current government air pollution policies.

As with all exercises in clarifying values, the dilemma with the appearance standard is that there is a constant balancing of ethical principles. One can imagine cases where the upholding of a fundamental value trumps the issue of appearance. In a hypothetical example, an official responsible for disease prevention in prisons might be an advocate for provision of contraceptives to prevent AIDS. This disease is rampant in the prison system, with hundreds of inmates infected and dozens dying each year. In this particular state, state law bans purchase of such contraceptives by the state. The employee could create a non-profit organization to provide contraceptives free of charge and become a spokesperson for that group. Perhaps a newspaper accuses this employee of coercing inmates into using contraceptives forbidden by the state and therefore encouraging homosexual sex among inmates. Under the Wild standard, a judge could find it reasonable to fire this person because it would "bring public obloquy" on the prison system.

SPECIFIC RULES

Attempting to clarify the concept of appearance of impropriety, numerous governments codified the concept in the 1990s. Although this is true for a number of federal, state, and local governments, as well as Canada and Australia, the paradigm case is the executive branch of the U.S. federal government. In 1989, then President George H. W. Bush issued *Executive Order 12674*, which articulated 14 general principles of government conduct, including "employees shall endeavor to avoid any actions creating the appearance that they are violating the law or the ethical standards promulgated pursuant to this order."^[7] In the executive order, President Bush further ordered the U.S. Office of Government Ethics (OGE) to promulgate regulations to clarify and allow for enforcement of these standards, including appearance.

The regulations appear in Subpart E of the regulations (5 CFR 2635.501–503) entitled *Impartiality in Performing Public Duties*.^[8] There are two detailed provisions that deal with different aspects of avoiding "an appearance of a loss of impartiality." The first issue focuses on appearance issues that would be created by personal or business relationships. For this, the OGE used the traditional English Common Law Standard (5CFR2635.501) "an employee should not participate . . . if he determines that a reasonable person with knowledge of the relevant facts would question his impartiality in the matter." The guidance actually provides a "test" (2635.502) for an employee who is unsure of how to answer the question of appearance

by detailing types of relationships, as well as types of actions that would constitute an appearance of impropriety. This expands the prohibition against actual conflicts of interest in the criminal statutes (18 USC 208) that forbids actions that would benefit an employee, his or her spouse, or their minor children. In effect, this regulation extends the appearance of a conflict of interest to any member of the employee's household or someone with whom the employee has a personal relationship (e.g., parent, lover, uncle, sister, companion, personal friend). Interestingly, it also allows an independent source (authorization by an agency designee) to use an additional series of factors related to the impact on the agency to make an appearance determination. For the executive branch of the federal government, this determination would be usually made by the ethics official in the agency.^[9]

The regulation also provides several vignettes to illustrate how to apply the regulation, for example:

An employee of the Internal Revenue Service is a member of a private organization whose purpose is to restore a Victorian-era railroad station and she chairs its annual fund raising drive. Under the circumstance, the employee would be correct in concluding that her active membership in the organization would be likely to cause a reasonable person to question her impartiality if she were to participate in an IRS determination regarding the tax-exempt status of the organization.

What the regulation attempts to do is to provide some guidance to evaluate the circumstance oneself. If that does not resolve the question, the regulation provides a set of standards through which an independent, third party can make a determination.

The second part of the regulation deals with the appearance problem of receiving extraordinary payments (defined as that is \$10,000 or more in value) from a private organization when joining the government. In effect, there is a 2-year disqualification (from the date of receipt of the payment) from dealing with any specific matter before the government in which a prior employer has an interest. Unlike the first section of the appearance standard that involves various tests and balancing of interests, this second standard suggests a clear-cut standard of appearance.

THE FIDUCIARY RESPONSIBILITY

It is worthwhile noting that appearance of impropriety or losses of impartiality are not isolated to the public service. There are many notable examples in the non-government arena where chief executive officers, as well as others, have been fired because of acts that

appeared improper or unethical. Indeed, there is a fiduciary responsibility in publicly traded companies to stockholders and other stakeholders. However, there is a significantly broader sense of fiduciary responsibility for public servants, and this is often ignored when one analyzes appearance problems in public service.

There are several dimensions to the breadth of fiduciary responsibilities for public servants, including the constitutional undergirding of public service, the limits to privacy, and the growth of transparency. Most constitutional regimes put extraordinary constitutional obligations on public employees. For instance, in the United States, all public employees (including the vast majority of state and local officials) take an oath to uphold the Constitution. They do not swear to support their immediate supervisor, the head of the agency, or the president. Rather, they swear to uphold a document that begins "We the people . . ." Although this oath takes many forms, it is worthwhile noting the similarity in most ethics regimes as reported to the Organization for Economic Cooperation and Development (OECD).^[10]

Although privacy concerns are a growing arena for constitutional debate in many countries, one of the few areas of contraction can be found in terms of public servants. In the United States, the use of public financial disclosure is an obvious example of the importance of appearance over the value of privacy for public servants. Currently, the OGE accounts for more than 20,000 public financial disclosure forms in the executive branch of the federal government alone. Because ethics officials review these forms and actions to eliminate real or apparent conflicts of interest, they must be taken before they are permanently filed. Available to anyone on request, the primary purpose of the forms is to eliminate any appearance problem. The growth of disclosure systems since the early 1990s, as noted in the OECD report mentioned previously, is nothing short of remarkable. This is true worldwide, including countries as diverse as Argentina, South Africa, and Slovakia. It is also true in most states in the United States and provinces in Canada.^[11]

Some of these systems are confidential and not public. Confidential systems also rely on the citizen's faith in the independence and objectivity of offices reviewing such disclosures. The Canadian Ethics Counsellor is responsible for reviewing financial disclosure and eliminating conflicts.^[12] In a recent address, the Ethics Counsellor, Howard Wilson, commented that Canadians had faith in his office, and the Canadian people's respect for privacy would never put up with a public disclosure system for their public officials. One wag responded that the Canadian system was simply one scandal away from public disclosure.

Transparency, or the general openness of government, is another major force expanding fiduciary

responsibility. From procurement to contracting, and from hiring personnel to making major policy decisions, government transparency is designed to not only eliminate impropriety, but also to eradicate the appearance of impropriety. Perhaps the best legal example of this is the Freedom of Information Act. Although many in the media complain about redacted or denied documents, the law places severe limitations on what an agency can keep out of public scrutiny. Generic requests can place overwhelming claims on an agency's personnel and time. For example, one request from a conservative non-government organization for any document with the name "Hillary Rodham Clinton" required a search of every paper file, electronic file, and e-mail. The search, gathering, review, and release, all under legal supervision, took hundreds of personnel hours of labor for what was little more than a fishing expedition. Whatever one thinks of such processes, they are a stark testament to the broad fiduciary responsibilities to which we hold public servants.

CONCLUSION

The appearance of impropriety is both a vexing and illuminating concept. It is vexing because, although it appeals to fundamental values, it also undermines fairness. It is illuminating because it points to the extraordinary set of responsibilities of public servants, and the growing expectations around those responsibilities held by the public. In a sense, the appearance of impropriety is the leading edge of the organic expansion of public service ethics. Impropriety acts as a sort of tidewater mark, to which laws and regulations ultimately rise. Dennis Thompson called this phenomena mediated political corruption.^[4] Appearance of impropriety rises to inform and define the definition of political corruption. For this reason, understanding the shape and volatility of the appearance of impropriety is vital for political leaders and the public service, in general.

As Judge Frank Nebeker, then Director of the U.S. Office of Government Ethics, wrote in an opinion excoriating former Reagan Attorney General Ed Meese:

Avoiding criminal conduct is not the mark of public service. The duties imposed by non-criminal standards are far harder to discharge. They may even be strange and seem overly restrictive to some joining the government for the first time ... [But] the vast majority of officers and employees are hard working and loyal individuals who make every effort to adhere to the

high ethical standards the public has a right to expect from them and that they expect from themselves.^[13]

Therefore, although the appearance standard has a legal foundation, only emphasizing jurisprudence would ensure that we would miss its political weight and importance. The appearance standard is also grounded in political values and is an expression of democratic accountability. The basis of appearance is the notion that civic employees are servants of the public, and therefore must do everything in their power to assure citizens that government officials are working for the *public good*.

Appreciative Inquiry

Thomas W. Kent

Department of Management and Entrepreneurship, College of Charleston,
Charleston, South Carolina, U.S.A.

INTRODUCTION

This article describes the nature of appreciative inquiry (AI) and what is involved in it. It is, essentially, an organizational intervention that is based on the premise that every organization has strengths and a history to be proud of. The process brings those strengths and proud moments to the fore, as a way to help regenerate people's optimism and hope, as they enter a significant planning process. The article describes this planning process in overview. For an in-depth description of the four stages, the reader should see the resources mentioned at the end of the article.

OVERVIEW OF AI

Much of the impetus for organizational change comes from negative forces. We do not like the way something works and we want to change it, we see problems that constantly reoccur and we want to fix it once and for all, competitors are eating our lunch and we need to do something, and we have personnel issues that are vexing and must be resolved. These are some of the drivers of organizational change as well as examples of negative forces.

It is arguable, but a solid case can be made that this is not the best starting point for a successful future. Whitney and Trosten-Bloom, for example, suggest that when you start from the negative, you set the stage for raising employees' doubts and fears and for increasing resistance to change.^[1] Frequently, as a result, the leaders of the change effort end up having to force the change through the organization, while losing employee commitment and cooperation as they do. In addition to that, working from the negative establishes a "fix it" mentality. When we fix something, we generally like to repair it back to something close to its original condition or working order. Or, we try to patch over a problem so that the situation is workable. Neither of these latter processes really enables organizational improvement. Let us look at a more positive approach to organizational improvement or transformation.

AI has been around as an organizational intervention for about 20 yr. It has been used in all kinds

of organizations—large and small, governmental, sales, media, community councils, and high tech.^[2–7]

Some of the most significant work using AI has occurred in community settings. "Imagine Chicago" may be the best example.^[8] This was a 10-yr effort, designed to create citywide learning communities and economic relationships that promote justice vs. deepen the divide between rich and poor. It began in 1992 and continues today, involving thousands of the citizens of Chicago. A small design team and 50 interviewers marked the beginning of the project, which eventually involved a wide range of individuals and institutions, including grassroots leaders, public schools, teachers, immigrant and faith communities, school children, and parents. This project took place in three stages: *understanding* what exists by focusing on the best of what exists; *imagining* what can be; and *creating* what will be. Below is a more descriptive account of the usual AI steps.

AI starts from the basic belief that every organization has identifiable strengths and assets that can serve as the starting point for change. With a clear picture of these strengths and assets in mind, the process creates a positive vision of the future—one that draws employees to it vs. something negative they might run from. This idea is like the planning methods of Ackoff when he suggests doing "ends planning" by creating an idealized design of the organization and then planning your way to that end.^[9] In practice, the AI process takes several days and involves all stakeholders. The process can involve many people, some times hundreds and, on occasion, thousands.^[10]

Cooperrider et al. call an organization's strengths and assets the "life-giving forces" within the organization.^[11] He believes that the job of the organization's leaders is to create an alignment of positive forces, so that the negative aspects of the organization become irrelevant.^[12] The AI process seeks to identify these forces and use the energy they engender to ignite the collective imagination of organization members to help them dream about what could be in their future as an organization.

The process involves four steps or phases: discovery; dreaming; designing; and destiny. This is what Cooperrider calls the "4-D" cycle (Fig. 1).

Fig. 1 Four stages of the appreciative inquiry change process.

DISCOVERY

The Discovery phase (or the *understanding* stage in the “Imagine Chicago” project) seeks to identify the best of what currently exists within the organization/community. This process generates positive excitement among the participants, and this allows them to envision new possibilities and new actions. The participants of the AI process are asked two questions:

- What factors give life to this organization when it is and has been most alive, successful, and effective?
- What possibilities, expressed and latent, provide opportunities for more vital, successful, and effective (vision-and-values congruent) forms of organization? (on page 32 of Ref.^[9])

During this phase, participants share their experiences and memories of significant accomplishments, momentous achievements, meaningful relationships, and other memories that they most value about the organization that they want to see sustained, enabled, and brought into the future. During this stage, people “appreciate” their organization more, and they are drawn together in an atmosphere of hope and anticipation.

Out of this process, a topic or set of topics is selected for further discussion and planning. The topics are selected by a microcosm of the organization—people from all functions and levels of the organization or community. Customers, clients, citizens, suppliers, and others may be a part of this microcosm. This team serves as a “steering committee” for the process and part of their role is to select the topics that will be carried forward through the process. It is important that all members of this team have an equal voice. School principles, managers, community leaders, and other power figures must not control the discussions.

DREAMING

The first stage—the discovery stage—naturally leads to images of what might be possible in the future. In the “Imagine Chicago” project, this stage was called *imagining*. This is the objective of the dreaming stage—to imagine a compelling future that is also practical. It is practical because it is anchored in the past, in the sense that the images of the future come from discovery-stage discussions of great moments in the past. During the dreaming stage, stakeholders imagine and discuss inspiring possibilities and great achievements that can contribute to the organization’s success and to the world.

The dreaming stage includes all the people involved in the previous stage. It is this, huge in some organizations, group that does the dreaming and creates the vision of what the organization is to become. The advantage of this process is that it is the “workforce” that creates the vision. Unlike a vision that is the brain child of the top administrator or the top management team, this vision belongs to the individuals whom the vision will most directly affect—employees, community members, etc. They carry it out in their heads when they leave the meeting. The top administrator does not have to hold numerous meetings to share the vision and to convince people that this is a good thing.

People pursue their own dreams; they do what they see in their minds. As a result of the dreaming stage, a common vision occurs to a large group of organizational members. Consequently, we automatically—even if we do nothing else—have a large number of people pursuing the same end.

DESIGNING^a

In the third stage—designing—the stakeholders create images that serve as the architecture of the new organization. The architecture includes new or changed structures, processes, and systems. They are based on the recollections of the moments of greatness that were shared in Stage 1 of the process. Some of the elements that might be designed could include partnerships, planning processes, environmental positions, societal relationships, results, leadership, training, communications, and hundreds of others. The participants do not actually redesign existing systems or processes but—through discussion—identify the systems, structures, and processes that will be designed in detail later and set the model, goals, and boundaries for the actual designs.

^aThese two steps were combined into one in the Imagine Chicago project and were called “*creating*.”

DESTINY^a

This stage is also called the “delivery” stage, because its goal is to ensure that the dream is brought to reality. In this stage, groups volunteer and appoint themselves to carry out the actual design and implementation work that must go on within each of the design elements chosen in the previous step. This stage is an ongoing stage, since implementation takes time. During that time, the large group acts as a massive design team, as the entire group reconvenes from time to time to receive updates, approve designs, lend support to volunteer or implementation teams who may be struggling with implementation questions, redirect efforts that have gone astray, etc.

It should be noted that the large group’s role is not that of monitoring progress. Its actual job is to sustain and build energy by recreating the culture of appreciation that was reached in the early stages and by infusing creativity into the implementation process. In a sense, each time the large group reconvenes, the energy and optimism that were built in the first step of the process are recreated. Thus, the large group’s work at this stage is to maintain optimism and commitment within the small groups that are doing the hard work of implementation.

The challenges during this stage are mainly two: One is to sustain the high level of energy that initiates the process through to the end of the process and the other is to maintain the level of creativity and innovation that is fostered in the beginning stages of the process.

The process starts off in Stage 1 with a very large group—typically. Some call this the Conference Group. The positive nature of the work done in the early stages builds tremendous excitement and energy. As time goes on during the fourth stage, this energy and excitement would naturally ebb. The key is to keep the large group—the Conference Group—engaged and energized. This group must be reconvened throughout all the stages. In this, the destiny stage, instead of analyzing results, critiquing actions, checking time tables and commitments, etc., the large group describes positive changes that have occurred, exciting moments of implementation, success stories, and so on. They do what is necessary to maintain the momentum and to keep the energy positive.

Among the important things the Conference Group does for the implementation teams is to create a reinforcing culture. By recognizing and elevating the status of innovative thinking, “out of the box” ideas, and creative action, they make it OK, even valued, to be innovative and daring. In one case, in a very large chemical

plant, an accountant, who had never been in the operations portion of the plant to any significant extent, simply wondered out loud to the implementation team if something would work in the operations area. The team explored the idea and saved the company tens of thousands of dollars each year. This story was told at a Conference Group meeting, and people went wild with enthusiasm. Not only had the company saved a lot of money, but an accountant came up with the idea (imagine that), and accounting and operations were actually working together (you are kidding—unheard of). The event sparked enormous amounts of fun, enthusiasm, optimism, and innovative ideas. These kinds of stories tell people that it is a good thing to go beyond the ordinary.

TRANSFORMING EFFECTS

The AI process has the potential to change the organization in a number of ways. Some outcomes are very tangible; others are quite intangible. What most reports talk about are the tangible outcomes—improved productivity, greater efficiency, etc. But no less important or significant than these changes are the intangible types of changes that organizations report.

Here are a few of the areas in which leaders see and report changes in their organizations. The organization’s members become more positive and optimistic. As a result, people begin to experiment with unconventional ways of doing things. They are encouraged by what goes on within the process to risk change and to bring about new ways of doing things. Innovation expands, as people begin to think about all sorts of new ways to do the work of the organization. Finally, the spirit of cooperation and of sharing thoughts as a way to spark creativity grows. In the “Imagine Chicago” project, hundreds of learning communities were created, and future (now current) neighborhood leaders were created. They grew from the school children who participated in the early stages to positive leaders today. These are not particularly measurable outcomes, but they are observable. Furthermore, they are changes at the heart of the processes that drive organizational success.

CONCLUSIONS

AI is an organizational intervention that has been available for a couple of decades. It can lead to substantial change both in terms of the creation of new methods, systems, and structures and in terms of new or improved processes that are at the heart of organizational and community performance. There are, after 20 years, a number of excellent sources that

^aThese two steps were combined into one in the Imagine Chicago project and were called “creating.”

can help the reader understand AI and how to use it. It is likely that leaders who wish to embark on this journey may wish to use outside facilitators to help with the process—especially if the system the leaders are attempting to change is large. Many of the authors of the references given below can assist leaders, and many universities in their schools of business or departments of public administration have faculty members who are able facilitators of this process.

Arbitrage

Susan MacDonald

California State University, Stanislaus, Turlock, California, U.S.A.

INTRODUCTION

Arbitrage refers to the simultaneous sale and purchase of identical securities or other financial instruments on different markets to take advantage of price differentials for profit. When applied to the public sector, arbitrage involves state and local government use of proceeds from tax-exempt bonds on investments that yield a higher rate of return than the interest on the bonds themselves. The difference between the two rates is considered profit or arbitrage, and since 1986 must, with few exceptions, be rebated to the IRS.

In the private sector, true arbitrage is completely hedged. In other words, both sides of the transaction are guaranteed at the time the position is taken so there is no risk of loss. If Security X is selling in New York for \$50 per share and in Chicago for \$49.50, the arbitrageur would purchase shares in Chicago and sell them simultaneously in New York, making a profit of \$0.50 per share. The price differential or profit is also known as the spread. Transaction costs must, of course, be deducted from the spread and they may include commissions and interest, if money is borrowed to purchase the shares. Arbitrage differs from traditional investing in that profits are made by the trade itself, not from the appreciation of a security. In fact, holding securities long enough for them to change in value is generally considered a risk by the arbitrageur.

Efficient markets do not, by definition, afford many opportunities for profit making through this type of trade, and arbitrage has been credited with contributing to market efficiency and “the law of one price.” This does not mean that efficient markets afford *no* opportunities for arbitrage; it does suggest, however, that arbitrageurs have had to modify their approach as they look for new opportunities in increasingly efficient markets. There are essentially five types of arbitrage in the private sector: simultaneous, risk, index, pair trading, and technical trading. In the public sector, there is only public debt arbitrage, which is essentially a form of simultaneous arbitrage—although it does not exactly occur simultaneously. Several factors have been instrumental in changing the nature of arbitrage over time; these include new market opportunities; new technology, especially in telecommunications and data processing; and advances in

mathematical and statistical theory. This essay will briefly trace the evolution of arbitrage—largely in the United States,^a and conclude with some observations about new venues for arbitrage and potential ramifications for public administration.

SIMULTANEOUS ARBITRAGE

Little was written about arbitrage until the early 1970s, although it had been practiced for almost 50 years in the United States. Guy Wyser-Pratte^[2] was one of the first to explain the details of risk arbitrage, and he traced the practice back as far as 13th century Italy when Venetian merchants took advantage of differences in currency exchange rates in order to make a profit. Einzig,^[3] writing in 1970 about foreign exchange markets, speculated that arbitrage in silver coins might be traced as far back as 500 B.C. and the ancient Persian Empire. In any event, profiting from differences in currency exchange rates is perhaps the most basic type of arbitrage and is still widely practiced today. Textbook examples and exercises can be readily found on the web. An example from the Association for Computing Machinery and University of Virginia explains:

Arbitrage is the trading of one currency for another with the hopes of taking advantage of small differences in conversion rates among several currencies in order to achieve a profit. For example, if \$1.00 in U.S. currency buys 0.7 British pounds currency, £1 in British currency buys 9.5 French francs, and 1 French franc buys 0.16 in U.S. dollars, then an arbitrage trader can start with \$1.00 and earn $(1 \times 0.7 \times 9.5 \times 0.16)$ 1.064 dollars thus earning a profit of 6.4 percent.^[4]

Later, the author cautions that the trader must *begin and end* with the same currency; otherwise the profit remains only hypothetical. This is consistent with the idea of hedging, or both sides of the transaction being known in advance and acted upon, thus without risk.

^aFor a comprehensive examination of cross-national arbitrage opportunities, see Ref.^[1], which provides a thorough and accessible comparison of markets, stock exchanges, and taxing circumstances affecting arbitrage opportunities around the world.

Several aspects of currency arbitrage are applicable to arbitrage in general: first is the timing. Currency exchanges take place at virtually the same time, so there is little risk of exchange rate volatility. Second, cash resources need not be tied up for long periods so there are no opportunity costs.^b Third, transaction costs must be deducted from the profit. This was probably less a concern in the 13th century than today, but arbitrage often involves small price differentials and is therefore financially more viable for those who can trade with few transaction costs. Fourth, currencies are convertible in two directions (francs can be exchanged for dollars, just as easily as dollars can be exchanged for francs). This increases the flexibility of currency conversion over other types of arbitrage. Similarly, there are often two components, or legs, to arbitrage transactions that must be balanced for profits to be realized; in the case cited above, conversion back to dollars was necessary for the profit to be realized. Finally, price differentials are normally short lived. Competition in the arbitrage arena is limited, but fierce. Actors must be able to act quickly. In sum, the arbitrageur takes advantage of small differences in price by trading *large quantities* at very *little cost* and in *very little time*. In the 20th century, arbitrageurs have largely been *institutional* traders whose profession is the prompt identification and agile execution of complex trades. The arbitrageur is, therefore, very different from most individuals involved in financial markets—he or she looks for price differentials within and across markets and engages in trade to exploit these differences. They have highly specialized skills and *substantial* resources—both in terms of dollars and state of the art technology—at their disposal.

EARLY FORMS OF ARBITRAGE AND TENDENCY TRADING

Historically, opportunities for arbitrage were found largely in markets dominated by government issues—whether currency, bills of exchange, or public bonds. The legendary story^c of the Baron von Rothschild's actions around the Battle of Waterloo provides a useful illustration. In 1815, the head of London's Rothschild bank sent carrier pigeons to the Battle of Waterloo so that he could learn the results of the battle before the news became public. Upon the pigeons' return, Rothschild ostentatiously sold British bonds on the London Stock Exchange, giving the impression that the British had lost to Napoleon. This led others

to sell their bonds, causing a drop in price. Rothschild then surreptitiously repurchased the bonds for a profit before human messengers arrived with news of Wellington's victory—and a recovery in the price of the financial instruments. Poor communication, lack of information, and timing played important roles in this arbitrage—as did a little deception. Of course these conditions were short lived.

Throughout the 19th century, European markets provided similar opportunities for arbitrage. As communication across markets improved, it became easier for traders to take advantage of differences in the price of securities on the London, Paris, Amsterdam, and Frankfurt exchanges. The simultaneous trading of identical securities kept arbitrage risks low and the trade straightforward, although currency fluctuations might complicate an arbitrageur's calculations. As traders became more experienced with equity price differentials, the spreads narrowed and opportunities for arbitrage lessened. This led the more adventuresome to begin *tendency trading*, or selling Security A in a temporarily upward-moving market and buying Security A in another market where it appeared to be declining. Such trading modified our definition of arbitrage by *expanding the time frame* for completing transactions. It also increased the risk. In the United States, traders found opportunities for arbitrage in railroad restructurings and similar corporate events that were common in the 1930s.

RISK ARBITRAGE AND CORPORATE EVENTS

Market circumstances in the 1930s provided new opportunities for arbitrageurs in the United States. During the Great Depression, many railroad companies found themselves undercapitalized and forced into bankruptcy. Those who were able, reorganized, recapitalizing their operations and providing new opportunities for arbitrage. A merger usually involves two corporations—one stronger, let us say A, one weaker, let us say B. A offers to take over B by using A's stock or cash, or a combination of the two, and converting B's shares into A's at a time certain in the future and at a specified ratio, usually less than 1 : 1. Negotiations between the two sets of corporate leaders take place in secret. However, once the *corporate event*^d has been made public, a time frame for completing the merger is announced. During this time, shareholders of both

^bIn economics, opportunity costs refer to alternative uses of financial resources that might yield greater profits.

^cThe story is told in Ref.^[5].

^dThe term "corporate event" is often used instead of merger, but its application is far broader and includes any corporate action such as mergers, acquisitions, hostile takeovers, as well as corporate decisions to convert preferred stock issues or convertible bonds into common shares. See especially Ref.^[6].

corporations must vote on the merger; and government agencies, like the Department of Justice, must act on the proposal. Denial by any one of these bodies will delay the process at best, or scuttle it altogether, at worst. For the arbitrageur, either circumstance may not only destroy his or her chances of profit, it may result in substantial losses.

The arbitrageur makes money from mergers, acquisitions, and other corporate events through a speedy yet astute assessment of the proposal, access to substantial amounts of cash (often borrowed at very low rates), and privileged treatment on the exchange, such as that reserved for large institutional traders. Once the intended merger has been made public, the arbitrageur will begin gathering details about the arrangement. Some of this information will be available in public documents; some will be available only by word of mouth among insiders. The arbitrageur is particularly interested in the business soundness of the proposal. Once this has been established, the arbitrageur considers problems that might prevent the merger from occurring. These include actions of regulatory bodies like the FTC, FCC, or ICC; tax decisions by the IRS; antitrust investigations by the U.S. Department of Justice, as well as the votes of shareholders in both corporations. Again, time is crucial in assessing the merits of the opportunity, as others will be examining the merger for their own benefit. Finally, the arbitrageur's own circumstances, including tax consequences, access to capital, and available interest rates must be factored into the equation before she enters into the process.

Basically, what the arbitrageur tries to do is situate himself in such a way as to take advantage of the anticipated boost in value that *B* will experience once the merger has been consummated. The arbitrageur does this by selling *A*'s shares short—that is, borrowing shares of *A* and then selling these borrowed shares on the market. The lender will specify when the shares are to be returned and the conditions under which the loan is made, including interest rate, securitization requirements, etc. The advantage for the arbitrageur is that he will be able to *return the shares*, not cash, at the time specified. The arbitrageur then uses the cash he has obtained from selling *A*'s shares to purchase *B*'s shares long. In other words, he buys *B*'s shares at their current value and holds them until the merger has been consummated. Because *B*'s shares will be converted into *A*'s according to the ratio specified in the agreement, the arbitrageur can calculate in advance how much profit to count on—assuming, of course, that the merger materializes in the time projected. Any change in either condition will affect the trade's profitability. Holding shares beyond the negotiated date converts the arbitrageur into an investor, making him susceptible to all of the market's myriad vagaries with

few of its benefits. It is because of the extended time frame and uncertainty that this is known as *risk arbitrage*.

Mergers were not the only corporate events that provided arbitrageurs with an opportunity for profit. Other events included the divestiture of public utility companies following passage of the 1935 Public Utility Holding Company Act, corporate acquisitions—both friendly and hostile, price disparities between common shares and convertible stock, convertible bonds, or purchase warrants issued by the same corporation, and cash-tender offers.^e The specifics of each of these transactions vary, but the merger principle remains the same: Corporate securities that share a common underlying value were temporarily out of sync. Arbitrageurs took advantage of the disparity, which they realized was short term. In the process, they often provided the liquidity necessary for the corporation to complete its transaction successfully.

Interest in arbitrage has waxed and waned since the 1930s, but the veil of secrecy surrounding it was lifted during the 1970s. This was due in part to authors like Wyser-Pratte and Evans, Jr., whose works have already been mentioned. However, it was also due to the extensive publicity surrounding arbitrageurs like Ivan Boesky, whose notoriety both attracted new investors and eventually served as a cautionary note of the risks involved. In 1977, Boesky boasted of annual profits approximating \$30 million; within 10 years his net worth was estimated at \$250 million. But in 1987 Boesky was also convicted of conspiring to file false trading papers and sentenced to three years in jail. Three years later, Michael Milken, another notorious arbitrageur, received a 10-year sentence for insider trading. Arbitrage could make one wealthy, but its risks appear psychological as well as financial.

INDEX OR ABSOLUTE ARBITRAGE

Index arbitrage is “the simultaneous sale and purchase of an *index future* and of a *portfolio* replicating the same index.”^[8] Like the example involving corporate mergers, two valuations are being compared; unlike the merger example, it is not immediately clear whether the index future or the portfolio should be bought or sold. To make this assessment, the definition requires further unpacking.

A *futures contract* is an agreement to buy or sell a commodity, currency, interest rate, or equity for a specific price at a specified time in the future. An *index future* is “a futures contract on a stock

^eArbitrage involving these other corporate events are covered extensively in Ref.^[7].

index ... [that is,] an agreement between a seller (short position) and buyer (long position) to a *cash settlement* based on the *change in the stock index's value* [emphasis added] between the date the futures contract is entered by the two parties and some future date.”^[9] Thus, simply put, we have four monetary values: today's futures (F_{T1}), today's stock index (S_{T1}), tomorrow's futures (F_{T2}), and tomorrow's stock index (S_{T2}). Of these, only the value of today's stock index is certain. Today's futures valuation (F_{T1}) is known, but that number includes an estimate of the stock index's value at *expiry*—the date in the future when the contract will expire and a final accounting will be made. Because estimates of the *index future* change regularly, the value of futures contracts will fluctuate. However, the closer one gets to expiry, the less fluctuation there will be. Indeed, at expiry, *the index future will equal the stock index*; it is just that the two indices do not mirror each other precisely in the intervening time. Because the two indices are identical at expiry, the transaction is *said to be* without risk.

In sum, an *index futures contract* anticipates a given exchange's value at a specific time in the future. Purchasing this type of derivative^f can be useful for people or institutions that own diverse portfolios on a given exchange, and that want to hedge their investment position. If they assume the market will go up, they may purchase an *index futures* predicting that the exchange will decline. If the index does indeed decline, the holder of the *index futures* can offset losses in his or her portfolio with gains from settling the *index futures*, once it has expired. This type of derivative instrument was introduced by the Kansas City Board of Trade in February, 1982 but the Chicago Mercantile Exchange (CME) followed suit in April that same year, trading futures contracts based on Standard & Poor's 500 common stocks. By 2000, 90% of all futures trading in the U.S. was conducted on the CME.

Financial instruments like stocks, bonds, futures, etc. are traded on exchanges in a bidding process; their values are negotiated by sellers presenting their *ask* price and buyers presenting their *bid*. To manage the results of these negotiations, futures contracts are settled daily, while all futures contracts (on the S&P 500) expire quarterly—on the third Friday of March, June, September, and December. The last trading days are the Thursdays prior to *expiry*. To appreciate what is entailed in the daily settlement process, it is helpful to review some hypothetical numbers. Clearinghouses like the CME require traders to make initial deposits, settle their accounts daily, and postpone full payment until expiry. Futures contracts themselves

are denominated in *points* that represent a fraction of their total value. On the CME, the initial deposit is \$23,438 *per point* and *each point is worth* \$250. Thus, if an investor buys 100 futures at \$1000 each and they close that day at \$1005 she will have made \$125,000, but will have to pay the clearinghouse:

\$2,343,800	(100*\$23,438) Initial deposit required at end of Day 1
<u>−\$125,000</u>	((1005 − 1000)*100*\$250) unrealized gains, in the trader's account
\$2,218,800	Net deposit required at the end of Day 1

The value of the starting position is much higher than the deposit. Because each point is worth \$250, the starting position is (100*250*1000) or \$25,000,000. Each day, both realized and unrealized gains and losses are tabulated and an accounting is made with the clearinghouse. In addition to the deposit, the CME requires a minimum reserve or “maintenance requirement” of \$18,750 per unit. If the trader in the example above had *lost* \$19 per share at the end of Day 1, instead of gaining \$5, her losses would have totaled (\$19*100*\$250) or \$475,000. This would then have been *subtracted* from the initial deposit of \$2,343,800, leaving her with a deposit of only \$1,868,800 or \$6200 shy of the required minimum of \$1,875,000. Had this occurred, she would have had to give the CME an additional \$6200 to continue trading, or settle her account completely at a substantial loss. Of course, daily losses *can* be made up on subsequent days, depending on the market. These daily tabulations are zero-sum—for every loser there is a winner, and vice versa. Excluded from the clearinghouse's daily accounting is interest, if cash or other financial instruments are borrowed—unless, of course, the loan is arranged through the clearinghouse itself, which typically charges higher rates than the market. Many arbitrageurs consider interest payments a cost of doing business that must eventually be deducted from profits. At expiry, the balance left in the trader's reserve is returned.

To get a sense of the numbers involved in this type of arbitrage, Reverre^[10] estimates that approximately one dozen institutional investors engage in this activity, and each has approximately \$5 billion in cash at their disposal. Finally, he estimates that annual profits per arbitrageur are around \$40 million.

How, then, is it possible for arbitrageurs to make these profits? Even a somewhat simplified answer requires us to return to the four values mentioned earlier: today's futures (F_{T1}), today's stock index (S_{T1}), tomorrow's futures (F_{T2}), and tomorrow's stock index (S_{T2}). As mentioned, we know the value of S_{T1} ; it is today's value of the stock exchange index. S_{T2} is calculated by projecting the cost of holding the stock

^fA derivative is a financial instrument whose return is *derived from* a formula or something other than interest.

portfolio, in its current configuration, until the expiration date. To calculate this, we estimate the *carrying costs* of the portfolio and then add these costs to the current value of the stock index. Assuming that the underlying value of the stock will remain constant, we estimate the interest required to borrow money for the portfolio and deduct revenues anticipated from dividends. We also know that the value of the futures contract (F_{T2}) will, by definition, equal the value of the stock portfolio (S_{T2}) at the time of expiry. If today's price of the futures contract exceeds the projected value of the stock portfolio that has just been calculated, ($F_{T2} > S_{T2}$), the arbitrageur will conclude that the futures contract is overpriced. He will then consider selling the index futures (taking a short position) and buying the stock portfolio (taking a long position). On the other hand, if the estimated value of S_{T2} exceeds today's price of F_{T2} ($F_{T2} < S_{T2}$), he will consider buying the index futures and selling the stock portfolio. Of course, transaction costs must be calculated to ensure that the arbitrage is worthwhile. Once again, profit margins are small, so it is imperative that transaction costs be kept as low as possible and that the volume involved is high. Only a few institutional traders can meet both conditions.

When index arbitrage was introduced in the early 1980s, computers facilitated many calculations, but were not sufficiently powerful to calculate the changing values of *all* stocks on a given exchange in the time required by arbitrageurs. Rather than base their calculations on all stocks, then, many institutional traders selected *representative* portfolios, which they traded in lieu of the entire index. As computers, and their software, became more sophisticated, arbitrageurs were able to rely on increasingly precise and sophisticated calculations. This made their jobs at once easier and more complicated, as trading itself once again moved into new territory.

PAIR TRADING AND SPECULATIVE ARBITRAGE

Pair trading, or hypothetical arbitrage, resembles the simultaneous trading of identical stocks on different exchanges for a profit. With pair trading, however, the sale and purchase can take place on the same exchange because the stocks are *similar*, rather than identical. What constitutes "similarity" is open to debate or judgment. What the arbitrageur looks for are *two stocks that normally trade at the same price*, but for some reason unrelated to their underlying value are trading at different prices. This will enable the arbitrageur to short the higher priced stock and to buy the stock selling at the lower price—making a profit when the two come back into alignment or equilibrium.

Speculative arbitrage, also described as technical trading, involves the same techniques developed in index arbitrage and pair trading, but takes advantage of advances in statistical probability, supercomputers, and mathematical modeling to identify arbitrage opportunities on a given exchange. Discussion of speculative arbitrage has exploded in the academic literature—it has become the new *terra incognita* for the most mathematically gifted in business schools. Indeed, the Association for Computing Machinery and University of Virginia web site that discussed currency exchanges, mentioned earlier, was set up as a *programming contest* to determine whether different currency exchange rates offered an opportunity for arbitrage. The program can be used as a prototype for any price comparison, including stock prices. Despite the popularity of speculative arbitrage in the academy, it has been largely prohibited on stock exchanges.

PUBLIC DEBT ARBITRAGE

Since 1986, public finance officers have had to become increasingly familiar with public debt arbitrage. Arbitrage, in this context, refers to any "profits" earned by state and local governments from investing their bond proceeds in financial instruments that yield more than the bonds themselves pay. Congress did not prohibit arbitrage in the Tax Reform Act of 1986 (P.L. 99-514); it merely required state and local governments to *rebat*e or tax arbitrage profits *in full* to the IRS. This requirement was applied to almost *any profits* earned between the first bond sale and the date the debt was retired, which could extend several years depending on the life of the project and debt restructuring. Some governments had issued bonds with the sole purpose of profiting from the interest differential—arbitrage—but the 1986 legislation applied to *any portion* of the proceeds (with limited exceptions) from the debt issue.

Historically, Congress neither prohibited such investment, nor taxed the surplus generated by these transactions. However, it began restricting the use of tax-exempt bonds as early as 1968, when Congress eliminated the tax exemption on any public debt used for *nonpublic* purposes. Indeed, if more than 10% of the proceeds from any public bond issue were used for *private* purposes, the entire bond's tax-exempt status would be revoked. In 1969, Congress extended the loss of tax-exempt status to bonds whose proceeds were used, in whole or in part, for investment in higher yielding instruments, or arbitrage. Although Congress allowed some exceptions, this legislation had the *effect* of increasing state and local governments' debt costs. Investors are attracted to tax-exempt bonds, whose returns are generally *less* than other financial

instruments, because their tax-exempt status allows investors to make money without incurring additional tax liability. If the bonds lose their tax-exempt status, investors lose that tax advantage and then expect the issuers to offer bonds with a higher yield, or interest payment—otherwise there is little financial incentive to purchase the lower yielding debt instruments. Increasing the interest payments not only costs the issuing agency more, it reduces the price differential or amount that can be earned through arbitrage. Nevertheless, many states and municipalities still found it worthwhile to forfeit the tax-exempt status of some bond issues in order to earn a higher yield. In the mid 1980s, before additional tax reform, Georgia's State Auditor, G.W. Hogan, estimated that as many as 40,000 state and local governments were able to add at total of \$729 billion to public coffers through arbitrage; the state itself earned almost \$40 million per year in this way.^[11]

In 1982, Congress passed the Tax Equity and Fiscal Responsibility Act (TEFRA), which tightened controls on municipal bonds by requiring agencies to *register* their bonds in order to secure tax-exempt status. (Arbitrage bonds were omitted because they had already been declared non-tax-exempt.) Registration was intended to reduce the fraudulent issuance of tax-exempt bonds. South Carolina officials believed the legislation violated both the states' Tenth Amendment reserved rights and their immunity from intergovernmental taxation, established in the 1895 Supreme Court decision, *Pollock v. Farmers' Loan & Trust Co.* Although *South Carolina v. Baker* was not decided until Spring 1988, the U.S. Supreme Court distinguished between states' rights to issue debt and Congress' ability to determine which debt instruments would be accorded tax-exempt status. As long as Congress did this in a nondiscriminatory way, the Court concluded, there was no infringement on the Constitution. The Court also addressed the question of taxing state bond interest.

By 1986, the federal government was facing budget deficits of historic proportions and members of Congress were making a concerted effort to eliminate as many tax loopholes as possible. Those who favored additional restrictions on state and local bonds argued that it was an inefficient use of federal tax dollars to ignore the revenues that states and localities were earning through arbitrage. They proposed that agencies *rebat*e their entire arbitrage profits to the IRS, in effect imposing a 100% tax on the spread, *in addition to* having removed the bonds' tax-exempt status. Rebate opponents argued, as in *South Carolina v. Baker*, which had not been decided at the time, that the federal government had no authority to tax state and local governments. Despite objections, the tax measure passed, although some exceptions were incorporated

into the final version. The following year, the U.S. Supreme Court heard *South Carolina v. Baker* and issued its decision in April 1988 (485 U.S. 505). The Court explicitly overturned *Pollock*, declaring that Congress *could* impose a nondiscriminatory tax on bond holders by removing the tax-exempt status of certain bond issues. It also upheld Congress' right to tax states on any bond interest earned. Presumably, this would apply only to registered, tax-exempt bonds as unregistered municipal bonds would not be tax-exempt and therefore trade closer to market rates.

The Supreme Court's actions have left opponents to focus primarily on the law's exceptions. In general, arbitrage restrictions apply to all registered, tax-exempt bonds issued after August 31, 1986 and these restrictions continue to apply to all bond proceeds until the debt has matured or the bonds have been redeemed. Congress allowed exceptions for small issues or bonds whose entire proceeds are spent within a designated, and limited, period of time. For example, municipalities issuing no more than \$5 million annually in tax-exempt bonds for public purposes do not have to rebate their positive earnings. This amount was increased to \$10 million in 1997 and to \$15 million in 2001 for public school construction, but remains at \$5 million for all other purposes. A second exception involves bond proceeds for construction where expenditures are completed within two years and kept to an agreed upon spending schedule. Any investment profits earned in the interim are exempt from rebate. Other exceptions involve Tax and Revenue Anticipation Notes (TRANS), debt service funds, and tax-exempt investments, but in each case, the investment period is short and the use of funds is narrowly defined.^g

The difficulty for bond issuers, and their finance officers, is that each debt issue, and the proceeds from each set of bond investments, must be tracked individually and in detail. Commingled funds, bond refinancing, and separate escrow accounts all complicate this tracking of bond proceeds for arbitrage-rebate purposes. Payment to the IRS is required every 5 years, but the agency has only 60 days after the due date to submit 90% of the full amount owed. Similarly, full payment is due to the IRS within 60 days of the last bond's retirement. This includes bonds that have been refinanced. Determining if and when investments meet these criteria is time consuming and costly.

In 1999, the Government Finance Officers Association (GFOA) released a survey of state and local government officials, that it conducted jointly with the National Association of Counties, and found that the average amount of time spent on arbitrage tracking

^gFor further information on arbitrage exceptions and requirements, see Ref.^[12].

was 303 hours per year, and the average annual cost was \$33,305. Costs ranged, however, as high as \$409,000 with the number of hours reaching 3360.^[13] These costs and staff expenditures were made regardless of whether arbitrage was involved. Indeed, bond tracking *must* occur if only to demonstrate to the IRS that the issuing agency has not engaged in arbitrage or that it meets the criteria for exemption.

GFOA has been working with Treasury staff and Congress to raise the \$5 million nonschool construction limit to \$25 million for municipal bonds. It has also been urging legislators to allow public entities without taxing authority to issue tax-exempt bonds so that cooperative ventures can be financed. More recently, GFOA has been promoting the idea of safe harbor legislation that would simplify both the accounting requirements and consolidate exceptions into one package.

NEW VENUES FOR ARBITRAGE

Since 2000, arbitrage has spread in various directions. Financial arbitrage has become more prevalent in hedge funds and large investors, like pension funds, are reported to be increasingly involved in arbitrage to offset market declines. It is also being used to take advantage of temporary price differentials that can occur when new regulations are phased in. Capital structure arbitrage exploits price differentials that occur when a company's debt and equity are out of sync. Arbitrage is also being used metaphorically. Articles now include topics like information arbitrage or product arbitrage where consumers take advantage of differences between the old, physical market and the internet market.

CONCLUSIONS

In the market, arbitrage is not only a source of profit for the powerful few, it has historically provided liquidity for corporate actions, contributed to market efficiency, and played an equalizing role through the law of one price. Arbitrage has played a different role in the public sector. In both sectors, arbitrage involves a sale and a purchase—at least nominally. But in the

public sector, state and local governments borrow money (sell bonds) and then invest the proceeds (purchase financial instruments)—there is no equivalent sale and purchase of an identical financial instrument, as in the private sector. Also, in the private sector, arbitrage serves the broader community as well as those directly involved in producing it; by contrast, in the public sector, the more powerful allow arbitrage but tax it at 100% and, in the words of Chief Justice Marshall, thus destroy it.

Asset Pricing

Greg Chen

School of Public Affairs, Baruch College, City University of New York,
New York, New York, U.S.A.

INTRODUCTION

This article discusses asset pricing, its theories and applications. It starts by reviewing portfolio theory and the concept of diversification. It then introduces the centerpiece of asset pricing model, the capital asset pricing model (CAPM). This is followed by a review of empirical testing results of the model. The failure of the model in explaining and predicting market data motivated the modification and development of new and more complex models. The article, subsequently, surveys and assesses selected alternative models, including the arbitrage pricing theory (APT), other multifactor models, conditional CAPMs, and CAPM with higher order comoments.

PORTFOLIO THEORIES

Portfolio theory is the foundation for modern CAPMs. Portfolio theory was laid out by the groundbreaking work of Markowitz^[1] and Tobin.^[2] Markowitz developed the notion of efficient frontier of portfolios. Each portfolio on the efficient frontier offers the maximum possible expected return for a given level of risk. Tobin laid the foundation of the separation theorem. The theorem states that a portfolio can be formed by separating the problem into first finding an optimal combination of risky securities and then deciding whether to lend or borrow, depending on your attitude toward risk.

In portfolio theory, investors face two kinds of risks, namely, diversifiable (unsystematic) and non-diversifiable (systematic). Unsystematic risk is the component of the portfolio risk that can be eliminated by increasing the portfolio size. Risks that are specific to an individual security such as business or financial risk can be eliminated by constructing a well-diversified portfolio. Systematic risk is associated with the economy or the overall movements in the general market, and therefore is often referred to as the market risk. The market risk is the component of the total risk that cannot be eliminated through portfolio diversification.

CAPITAL ASSET PRICING MODEL

Building upon the portfolio theory, Sharpe^[3] developed a computationally efficient, single factor, ex ante model to relate risks to expected returns, the CAPM. Mathematically, CAPM is expressed as follows:

$$E(R_i) = R_f + \beta_i[E(R_m) - R_f] \quad (1)$$

where $E(R_i)$ is the expected return on asset i , R_f is the risk-free rate, $E(R_m)$ is the expected return on the market portfolio, β_i is the beta on asset i , and $E(R_m) - R_f$ is the market risk premium.

The beta in the model represents an investment's non-diversifiable risk relative to the market risk. In other words, the beta of an investment measures the comovement of the investment's expected return with the market's expected return. The beta for a stock is defined as follows:

$$\beta = \frac{\text{cov}(R_i, R_m)}{\sigma_m^2} \quad (2)$$

where $\text{cov}(R_i, R_m)$ is the covariance between the returns on asset i and the market portfolio and σ_m^2 is the variance of the market portfolio.

The CAPM was developed under strong simplifying assumptions. They can be summarized as:

- Investors are price takers and have homogeneous expectations.
- One period.
- Presence of a riskless asset.
- Perfect market, i.e., no taxes, transaction costs, regulations, or short-selling restrictions.
- Returns are normally distributed or investor's utility is a quadratic function in returns.

The CAPM is an elegant, but very simplified representation of reality. The extent to which the model reflects the real world needs empirical examination.

Security Market Line

Graphically, the CAPM can also be expressed by the security market line (SML). This is illustrated in [Fig. 1](#).

Fig. 1 Security market line (SML).

The slope of the SML is equal to $[E(R_m) - R_f]$ which is the market risk premium and that the SML intercepts the y-axis at the risk-free rate.

In capital market equilibrium, the required return on an asset must equal its expected return. Thus, the SML equation can be used to determine an asset's required return given its beta. This can also be used to assess if an investment is correctly priced. If an investment's return falls on the SML, the investment should be considered correctly priced because the expected return of the investment matches the one required by the CAPM. However, if the expected return of the investment differs from the one as required by the CAPM, the investment should be judged as either underpriced or overpriced.

Estimating Beta

The CAPM is an ex ante model relating risks to expected returns. To use the model, one needs to know how to estimate the beta of a stock or portfolio. Beta is typically estimated by regressing the realized excess return on the individual assets on the realized excess returns on the market, following the regression of Eq. (3). Five years of monthly return data are often used in the estimation of beta and many financial institutions provide beta at a nominal or no cost.

$$R_i - R_f = \alpha_i + \beta_i(R_m - R_f) + \varepsilon_i \quad (3)$$

where α_i is the intercept and ε_i is the error term.

A typical data set of realized excess returns and the corresponding excess market return is illustrated in Fig. 2. The regression line superimposed into the data points is called security characteristic line (SCL). The slope of the SCL is the estimate of the beta of the security.

Fig. 2 Security characteristic line.

Empirical Test of CAPM

The empirical tests of the CAPM focus on the predictions about the intercept and slope in the relation between expected return and market beta.^[4,5] The approach is to regress a cross-section of average asset returns on estimates of asset betas. The model predicts that the intercept in these regressions is the risk-free interest rate, R_f , and the coefficient on beta is the expected return on the market in excess of the risk-free rate, $E(R_m) - R_f$. This prediction plays a prominent role in tests of the CAPM. In the early work, the main method of the test is cross-section regressions.

The results of the empirical test are mixed. Although earlier investigations confirm the model, the last 20 years have witnessed disappointing results. The general consensus at the present time is that the static one-period CAPM is unable to explain or to predict satisfactorily the cross-section of average returns on stocks.

There are many potential reasons for the inconsistent results of CAPM from theoretical and technical viewpoint. For example, factors, other than the single market index portfolio, may have contributed to the determination of returns;^[6] the use of realized return as a proxy for the expected returns may have produced biased results due to the aggregation of positive and negative market excess returns;^[7] the static CAPM does not allow the change of beta or market premium, conditional on existing information; and returns can be non-normal, violating a key assumption of CAPM.

Prompted by the disappointing results of the single-factor CAPM studies, extensive effort has been made to improve on the one-factor CAPM model. The key alternative models include the multifactor models, conditional CAPM, and CAPM with higher-order comoments. The following section surveys the alternative models.

ARBITRAGE PRICING THEORY AND MULTIFACTOR MODELS

One problem with CAPM resides in its assumption that the non-diversifiable risk of the portfolio (in relation to the market risk) is the sole determinant of its return. The arbitrage pricing theory (APT) models introduced by Ross^[8] extends the CAPM model to include other factors. Similar to the CAPM, the APT assumes that there is a relationship between the risk and return of a portfolio. Unlike the CAPM, the APT recognizes that other systematic factors affect the return of a portfolio too.

The APT is based on the no arbitrage principle (or law of one price). This principle states that any two identical investments cannot be sold at a different price. In other words, the theory states that market forces will adjust to eliminate any arbitrage opportunities, where a zero investment portfolio can be created to yield a risk-free profit.

The APT preserves the linear relationship between risk and return of the CAPM but abandons the single measure of risk by the beta of the portfolio. The APT model is a multiple factor model, which uses factors such as the inflation rate, the growth rate of the economy, the term structure of interest rates, in addition to the beta of the portfolio in determining the return of the portfolio. As with the CAPM, the APT can also be modified to determine the return of an individual investment.

The APT model has been empirically validated. In limited cases, the APT has been reported as outperforming the CAPM in terms of within-sample explanatory power.^[9] Moreover, APT requires fewer assumptions in its derivation which make the model more general than CAPM.^[8]

The key problem with the APT is that the factors are not well specified a priori. There is no consensus on what factors should be included in the model. Another perceived problem has to do with APT's macro perspective. Individual stock properties, such as size and earning are not normally considered in its factor selection.

A more general, and somewhat atheoretical approach is the multifactor models. These multifactor models postulate that microvariables such as size, ratio of book-to-market value, macroeconomic variables and the price to earnings ratio account for a sizeable portion of the cross-sectional variation in expected returns. Fama and French^[6] observed that the two nonmarket risk factors, SMB (the difference between the return on a portfolio of small stocks and the return on a portfolio of large stocks) and HML (the difference between the return on a portfolio of high-book-to-market stocks and the return on a portfolio of low-book-to-market stocks), are

useful factors when explaining a cross-section of equity returns.

CONDITIONAL CAPM

Another problem in CAPM has to do with conditionality. While the real world is dynamic, the model is static in nature. The conditional CAPM model is developed to address this problem. The conditional CAPM model provides for the variation of the beta, given the available information at the time. The idea is that CAPM holds period by period, although not consistently so over time. Conditioning on information at time, the conditional CAPM allows for the change of beta and market premium over time.

The empirical test results of conditional CAPM are promising, however, mixed. Some studies suggest that the conditional CAPM might hold, period-by-period, and that time-varying betas can explain the failures of the simple, unconditional CAPM.^[10] Other studies, however, show that conditional CAPM does not explain asset-pricing anomalies like book to market and momentum.^[11] They claim that conditional CAPM performs nearly as poorly as the unconditional CAPM.

HIGHER-ORDER COMOMENTS CAPM

The rationale for higher-order comoments CAPM is that investors need compensation for taking risks on skewed returns, and that skewness and kurtosis cannot be diversified away by increasing the size of portfolios.^[12,13] It is reasoned that if investors know that asset returns have conditional coskewness before hands, expected returns should include a component attributable to conditional coskewness. Harvey and Siddique^[12] reported that conditional skewness explains the cross-sectional variation of expected returns across assets and is significant even when factors based on size and book to market are included.

Kurtosis was also tried in higher order models in addition to skewness. Empirical test shows that systematic kurtosis contribute to the risk premium of an asset over and above that of system covariance and systematic skewness. Investors are generally compensated for taking high risk as measured by high systematic variance and systematic kurtosis. Investors also forego the expected returns for taking the benefit of a positively skewed market.^[14]

One identified problem with higher moments model is that ex ante skewness is difficult to measure.^[13] The issue needs further investigation, as precision in measurement is often a key or confounding factor in model formulation and validation.

CONCLUSIONS

This article reviews portfolio theory and discusses existing and evolving asset pricing models. The paper described the most popular model of CAPM, and assessed the validity of the models based on empirical test results.

The empirical record of the model is disappointing. The general consensus is that the static one-period CAPM is unable to explain satisfactorily the cross-section of average returns on stocks. CAPM is not consistent with data from the real world.

This is not totally surprising given the strong assumptions that CAPM made in its derivation. Capital asset pricing model is a highly simplified and stylized version of the reality. More complex and realistic models are needed for real world prediction. Many new and improved models have been developed over the past 50 years with qualified success. Further study on asset pricing is both essential and likely rewarding, given the central importance of asset pricing in modern finance.

Association of Southeast Asian Nations (ASEAN)

Richard K. Common

The Business School, University of Hull, Hull, U.K.

INTRODUCTION

Despite the diversity across a myriad of policy areas, the nation states that comprise the membership of the Association of Southeast Asian Nations (ASEAN) have developed a mechanism for “cooperation” in matters pertaining to public administration and policy across its member states. ASEAN now provides a regional rival to the older and arguably more important organization for public administration affairs in Asia, the Eastern Regional Organization for Public Administration (EROPA). Although ASEAN was established in 1967, it was not until the second meeting of the ASEAN Standing Committee in 1980 that the ASEAN Conference on Reforms in the Civil Service (ACRCS) was established as an ASEAN activity. The ACRCS was renamed the ASEAN Conferences on Civil Service Matters (ACCSM) in 1987, with a stronger emphasis on collaboration between member countries. Clearly, much of the impetus surrounding these developments was based on a desire among member states to facilitate economic integration in addition to positioning the region as an attractive place for foreign direct investment underpinned by strong administrative and policy capacities. A fundamental founding principle of ASEAN is cooperation between member states, and the ACCSM is regarded as one of its key cooperation initiatives. This entry will aim to evaluate the extent of cooperation between administrative systems in the region and the nature of the reforms that are being promulgated by the ACCSM.

PUBLIC ADMINISTRATION IN ASEAN

It is beyond the remit of this entry to describe in any detail the direction and nature of administrative reforms in each member nation of ASEAN (see other entries in EPAP). However, it is useful at this stage to pick up some major themes and points of difference within these countries. There are roughly three groupings within ASEAN based on the extent of modernization within the various administrative systems where there is a strong correlation between political stability and economic development.

Brunei Darussalam, Malaysia, Singapore

In this group, there have been considerable attempts by stable political leaderships to orientate administrative systems close to Western models.^[1] In particular, Malaysia and Singapore have come the closest to replicating the New Public Management observed in western nations, particularly Britain and New Zealand. However, even here it is difficult to generalize. For example, Malaysia’s “Look East” policy explicitly emulated the example set by Japan and to a lesser extent, Korea, in terms of economic and human resources policy. Brunei’s civil service has consistently looked to the United Kingdom for inspiration despite its unique monarchy.^[2] Arguably, these three nations are also the most economically successful in ASEAN.

Indonesia, Philippines, Thailand

This grouping has experienced varying degrees of political turmoil when compared to the first grouping, in addition to a similar variance in economic development. Both Indonesia and Thailand suffered particularly damaging consequences as a result of the Asian economic crisis of the late 1990s, and had to seek International Monetary Fund (IMF) loans. For Thailand, in particular, the program of economic reform that constituted the IMF response in 1997 included civil service reform. Economic progress in the Philippines has also been exacerbated by political instability. However, attempts have been made to modernize administrative systems in all three countries, but here generalizations remain difficult. For instance, Thailand’s system of government remains highly centralized when compared with that of Indonesia and the Philippines.

Cambodia, Laos, Myanmar, Vietnam

The third group of countries represent the most recent members of ASEAN, with Cambodia being the newest, joining ASEAN in 1999. However, with the exception of Cambodia, these countries are characterized by authoritarian rule and command economies, although Vietnam and Laos are engaged in cautious reform

strategies. For the purposes of this entry, what is clear is that administrative modernization has not been high on the agenda of any of these countries until very recently.

KEY COMPONENTS OF ACCSM

Under the auspices of ASEAN, it is proposed here that ASEAN acts as a forum for learning in terms of policy and administrative development. Comparisons with the European Union (EU) are largely futile in this area as a key component of the “ASEAN way” is to rely “on national institutions and actions, rather than creating a strong central bureaucracy.”^[3] However, the 1992 declaration of an ASEAN free trade area (AFTA) and the Asian economic crisis created pressures for “greater coordination and institutionalization.”^[3] Thus the ACCSM is pivotal to understanding developments in public policy and administration within ASEAN.

The main forum for discussing developments in relation to public administration policy occurs within the ACCSM biannual conferences. At each conference, technical and country papers are presented. The rest of this section will briefly review developments from the 8th ACCSM in Manila mainly because it marked the beginning of ASEAN enlargement and it signaled the start of closer cooperation and institutionalization of public administration practice within ASEAN member states.

At the 8th ACCSM in Manila in 1995, an Action Plan was endorsed entitled “Building Dynamic and Responsive 21st Century Civil Services” outlining the following objectives:

- Human resources development.
- Recruitment and selection.
- Information exchange.
- Research and development.

These objectives were to be met by resource sharing and through the use of ICT.^[4] For instance, in relation to human resources development, it was declared that member countries who have a “special interest in a particular field of public administration” set up ASEAN Resource Centers (ARCs) to disseminate information to other ASEAN members. The establishment of the Resource Centers has emerged as a key plank in the strategy of strengthening cooperation in public administration within ASEAN to allow the exchange of best practice within ASEAN member states.^[5] The ASEAN Covenant, “Toward Building Better Bureaucracies” formalized the establishment of the ARCs “to optimize the movement of goods and services across traditional boundaries.”^[5] What

is apparent is that the ARCs are concerned with the micromanagement aspects of public administration and policy only.

The 9th ACCSM was held in 1997 in Singapore, where it was proposed that each ACCSM was to be held on a biannual basis. Thus it was the 10th ACCSM, in 1999 in Thailand under the theme of “Good Governance: A Challenge for Economic Revitalization and Democracy Development,” that further consolidated the Covenant of the 8th ACCSM. In addition, it was the first ACCSM to be attended by all the current members of ASEAN. The conference also took place under the backdrop of the repercussions of the Asian financial crisis.

At the 11th ACCSM in Hanoi in 2001, the theme was “ASEAN Civil Services for Dynamic and Sustainable Development,” with the focus shifting to the post-1995 new member states. Both Cambodia and Laos proposed the establishment of ASEAN resource centers on Capacity Development of Civil Servants and Civil Service Performance Management, respectively. Only Myanmar has yet to submit a proposal.^a In addition, the ACCSM prescribed a role for member states with more developed administrative systems to guide others in terms of human resource development.

The theme of the last and 12th ACCSM in 2003 in Brunei was “E-Government: An Opportunity for National Development and Public Sector Modernization.” This represents macro-level cooperation within ASEAN and builds upon the creation of an e-ASEAN task force to develop a regional ICT strategy, linked to wider “E-Government” initiatives.^[7]

OBSTACLES TO COOPERATION

What is the likely outcome of closer cooperation between the ASEAN nations with regard to public administration? The sheer diversity of the nation states in question immediately militates against any generalizations. In terms of modernizing public administration and policy making within ASEAN, a strong “colonial legacy” could be a basis to predict whether a nation’s reform program will replicate those being undertaken in the West. Turner and Hulme^[8] identify the common features of the colonial legacy including a tendency toward centralization, ambiguity about the roles and relationships of public administrators and politicians, and a tradition of appointing “generalist” administrators to senior positions.

Although these features are readily identified in the majority of ASEAN countries, the colonial imprint is uneven across ASEAN. Britain colonized Brunei,

^aFor details of ASEAN resource centers, go to Ref.^[6]

Malaysia, Myanmar, and Singapore and likewise France in Cambodia, Laos, and Vietnam. The Dutch administered Indonesia until 1949, while its neighbors, the Philippines, were under the control of the United States until 1946, and Spain before that, until 1898. Thailand is the only ASEAN country never to be under the administration of a foreign power. However, Thailand's hierarchical society and bureaucratic polity, although unexposed to modernization early in its development, is typical of most countries in ASEAN. In the Philippines, U.S. colonial administration was influential, which helped some aspects of modernization but "the American emphasis on political and civil, rather than bureaucratic, action did not result in a highly trained Filipino officialdom."^[9] In Indonesia, the Dutch relied on local officials, which sided with the Dutch during the nationalist revolution, so they were politicized after independence.^[9] Overall, the "indigenization" of systems of public administration that followed colonization has served to preserve bureaucratic systems, which in turn, has made them resistant to reform.^[10]

Secondly, the elite domination of administration and politics in the ASEAN countries would suggest that ACCSM has important symbolic value. As Turner and Hulme^[8] have argued, bureaucracies dominated by technocrats tend to welcome reforms that give "legitimacy or the appearance of substance to the regime and state." Moreover, political legitimacy in the ASEAN countries requires strong economic performance; thus the appearance of administrative modernization has a strong appeal.^[10] For instance, the Philippines' policy making is "subject to the *particularistic* demands of a wealthy elite or oligarchy" supported by the bureaucratic management of the economy that compromises national economic development.^[11] The same is true of Indonesia.

In Vietnam, the major turning point for administrative reform was the Eighth Plenum of the Central Committee in January 1995, which focused on the reform of state institutions, the reform of administrative procedures, and the creation of a corps of administrative officials. It is the latter that addressed the civil service in particular as it was reported that only a minority of civil servants "were fully qualified to do their jobs... The reform involved the design of a new system and code, a new salary structure, and a new recruitment process based on examination and the retraining of old cadres."^[12] This development happened to coincide with accession to ASEAN the same year.

The newer group of ASEAN nations have had to quickly adjust to the Association's initiatives. Market reforms, implicit in the thrust of ASEAN initiatives, have also challenged the newer group in terms of bureaucratic management of the economy. Vietnam's historically bureaucratically managed economy has

been "progressively dismantled."^[13] For Laos, joining ASEAN was traumatic, as it "struggles to pay its ASEAN fees and lacks enough English-speakers and skilled diplomats to make an impression at the 300 yearly meetings of the organization and its various committees."^[14] In Myanmar, the problems are different and possibly more acute. Any colonial impact by Britain was negated by military rule, which "drove most of the trained civil officials from office" in 1962.^[9] The subsequent excessive corruption was recently exacerbated by a freeze on civil servants' salaries.^[15] Thus of all the ASEAN countries, it is probably Myanmar's administrative structure that is least developed. In a stark warning by Matthews,^[16] "there is simply no infrastructure to sustain a modern nation." Finally, Cambodia has had to respond to economic initiatives within ASEAN, which have required new institutional arrangements. This has demanded modernization of the civil service system in addition to developing appropriate human resources, developing appropriate incentive structures, and rooting out corruption.^[17] In addition, Cambodia faces similar problems to Laos when engaging with ASEAN. There is concern about a general lack of competence in English, the language of ASEAN, and the requirement to upgrade technical knowledge to be able to represent the interests of Cambodia within ASEAN.^[18]

CONCLUSION

Although ASEAN has explicitly promoted cooperation among its members in terms of policy, the overall picture tends to be one of divergence rather than convergence. This is partly explained by the political context as for most of ASEAN rule by military or civil bureaucracy or both, rather than rule by party is the norm. Convergence between such contrasting economies and political elites through strategies such as the e-ASEAN ICT task force is unlikely.^[7] However, the main objective of ASEAN, which is to enhance regional cooperation, as outlined in the Bangkok Declaration of 1967, looks more likely to be achieved through the ARCs and the dissemination of "best practice," rather than through any conscious attempt at the impossible task of converging administrative systems.

Attractors, Strange Attractors and Fractals

David Ogula

Valley Stream, New York, U.S.A.

INTRODUCTION

The conduct of complex dynamic systems has been the focus of research across disciplines. The intense scrutiny of such systems has led to the unearthing of such fascinating features as attractors, strange attractors, and fractals. Examining the behavior of dynamic systems provides a sense of the direction in which the system is headed, as well as allows us to determine patterns of behavior in systems that are otherwise unpredictable. The study of complex systems, of which attractors and fractals are a component, has provided the basis for a better understanding of the nature of chaos and turbulence.

Attractors provide an understanding of the behavioral results of a complex dynamic system, while strange attractors depict the gyrations between chaos and turbulence; that is, the notion that unstable motions result in a geometrically strange object. Fractals, on their part, make it possible for us to measure and define shapes in infinite detail.

The following review provides a basic understanding of some of the well-known attractors, fractals, and associated types. It also correlates with attractors, complex behavioral patterns, observable in organizations.

ATTRACTORS

The literature on chaos theory shows that chaotic systems manifest specific bounds that are peculiar to each system. Such systems are known as attractors. Simply stated, an “attractor” is a state into which a system settles. Chaotic systems are known to dissipate, which means that in the long term, such a dissipative dynamical system may settle into an “attractor.”^[1] Attractors and associated types such as strange attractors, describe the long-term conduct of a dynamical system.

Although there is still some controversy among researchers as to the appropriate definition of an “attractor,” most scholars accept the definition of an “attractor” as “a set in the phase space that has a neighborhood in which every point stays nearby and approaches the attractor as time goes to infinity.”^[1] An attractor could also be described as “... a model representation of the behavioral results of a system.” The attractor is not a force of attraction in the system,

it simply provides a sense of the direction in which the system is headed, based on rules of motion in the system.^[2] Others define an attractor as “a set for which a positive measure of initial conditions in a neighborhood are asymptomatic to the set.”^[1]

Nonlinear systems have a wide array of attractor types—point attractor, cyclic attractor or oscillating attractor, etc. The point attractor and cyclic attractor manifest when a system’s behavior repeats itself in precisely the same manner. A point attractor behaves like a free-falling object that comes to rest at a point—the point of attraction. Thus, a steady behavioral state corresponds to a fixed-point attractor, where all trajectories beginning from the appropriate “basin-of-attraction” eventually meet at a single point. Fixed-point attractors are said to be the only possible form of attractor in linear dissipative systems.^[3] On the other hand, a cyclic attractor or oscillating attractor behaves like a yard security light that comes on or goes off according to the amount of daylight.

According to Merry, attractors can also be simple linear systems, which can be calculated precisely. Such calculations are obtainable in organizational behavior. However, organizational behavior that displays such characteristics is more typical of mechanical systems and could apply to individuals only if they are treated as machines. Merry describes five distinct behavioral stages of organizational experience, comparable to the different stages in a person’s life. Organizations experience progression from growth to maturity, through crisis, and transforms in much the same way as do people.^[4]

In the first two stages, organizational behavior is repetitive, meaning that organizational behavior repeats itself in exactly the same way. The behavior of the organization (point attractor), repeats itself like a pendulum that comes to rest at the same point or like a thermostat that maintains the temperature between two points (cycle attractor).

The study of adaptive systems has shown that organizations go through different stages of order and chaos. That is to say, organizational behavior mirrors a cyclical stage, where the organization’s behavior changes and repeats itself, passing through cycles of complex forms—the cyclic attractor.

In the third stage, which corresponds to the dissipative stage, change occurs in organizations in ways that

cause it to break apart, causing entirely new structures to emerge. The organization at this stage is seen as a dynamic system capable of reconfiguring itself.^[5] In Kiel's view, this dynamic instability allows the organization to alter its basic structures as it responds to pressures for change.^[5]

At stage four, instability in the behavior of the organization becomes more pronounced. Bifurcation and strange attractors occur—a stage where organizational behavior bifurcates into a wide array of forms. Bifurcation denotes uncertainty, unpredictability, and reduction in the ability to control. The progression of change is “from similar, uniform behavior to a variety of different behaviors . . . there is a division of dissimilar behavioral patterns.” The notion here is that people will react differently to similar circumstances. Even when people are exposed to similar situations, their behavior breaks into a wide range of possibilities. Evidence of this can be seen in individuals, departments, and teams in organizations. Differences in behavior can be caused by a small change in organizational action. For example, the introduction of a simple work procedure such as setting a specified time for turning in employee time records, in a week, can create far more complicated reactions from employees. Furthermore, disciplinary action taken by management against one employee may be a signal for other employees to take their duties more seriously, or it may reduce morale, cause anxiety, or create an atmosphere of insecurity.

Although such organizational behavior is unpredictable, it is possible to delineate the pattern that is the framework of the dynamics of such behavior over time. For instance, there are situations in which one may be aware that a company's property may be subject to theft but cannot predict when or by whom (Ref.^[4], pp. 6–8). With regard to property damage suffered by the Verizon corporation during the August 2000, workers' strike, company management may have been aware that its telephone cables may be sabotaged, but they could not have been able to predict when and by whom, specifically. Merry reinforces this point, stating that in much organizational behavior that falls within this stage, the organizational behavior and relationships are based on a chaotic pattern strange attractors. One can know that a major transformation is going to take place in the organization, but it is impossible to foretell exactly how it will affect your team or work. He notes that, though at first glance, chaotic behavior seems to be the antithesis of organizational behavior, a second look shows that the variety and irregularity allow resilience and creativity, which are necessary for organizational learning—a condition necessary for an organization to survive.^[4]

In the fifth behavioral stage, the organization moves from “chaos to a new order.” This stage is referred to

as that of “deep chaos.” At this stage, the limits of the behavioral process disappear, and randomness becomes the order of events. However, it should be noted that in adaptive systems, deep chaos is a transitional phase in the system, where the old order breaks and disintegrates, allowing a new order to emerge, which replaces the old. Merry notes that “complex systems reach this state after internal gradients have turned into deep cleavages and external perturbations have agitated the system beyond a critical point.”^[4] The state of the former Soviet Union in its last stages of break up, and in a far more catastrophic way, the breakup of Tito's Yugoslavia, illustrate this state.

Notwithstanding the complex nature of attractors, its and related concepts such as strange attractors, basin boundaries, period-doubling, bifurcations, and the like, can easily be understood by those who have no mathematical or scientific background.^[6] Another example of an attractor is a limit cycle, which is a periodic orbit that attracts. Limit cycles attract as well as repel.

Attractors also produce basin boundaries. When two or more attractors are present, basin boundaries occur. Attractors in complex dynamic systems have their basins similar to a river with a watershed basin that empties into it, and each basin has its own boundary.^[7] It is common for basin boundaries to have unstable chaotic sets. The basin boundaries are pairs that separate different basins and easily reveal unstable chaotic pairs, which wind up as basin boundaries with intricate fractal structures.^[8]

The boundary between two or more attractors in a dynamical system serves as a portal of a kind that seems to govern so many ordinary processes. One behavior that becomes evident when the system settles is that of a chaotic attractor (or an attractor that is chaotic). On the other hand, other systems can wind up as a “steady-state” non-chaotic behavior but with several steady states. Where the initial condition is specified with precision, it becomes difficult to decide in which basin it lies, especially in cases where the boundaries are fractals (Ref.^[7], p. 233). The complicated structure of basin boundaries makes it difficult to predict long-term behavior.

STRANGE ATTRACTORS

Strange attractors are a class of fractals that depicts the long-term behavior of dissipative dynamical systems. Although all strange attractors are fractals, not all fractals originate from strange attractors. When initial conditions are drawn to a special type of attractor, that attractor is called strange attractor.^[9] Strange attractors describe the gyrations between turbulence and order. A strange attractor is said to emerge in the realm

of chaos, where everything is supposed to fall apart—instead, order emerges and not chaos (Ref.^[10], p. 117). Chaos and strange attractors require non-linearity. The term “strange attractors” was introduced by David Ruelle and Floris Takens in their presentation, “On the Nature of Turbulence,” in 1970. They remarked that when periodic motion goes unstable, the typical product will be a geometrically strange object.^[11] When applied to organizations, it becomes evident that even organizations often exhibit a pattern of behavior that is difficult to predict. They exhibit a pattern of behavior that can be described as chaotic and can take the form of the strange attractor, with gyrating or irregular twists and turns that give it the name of “strange.” But, such “behavior does have a pattern that throughout time can be identified and the form does have boundaries that set limits to behavior.”^[4]

Researchers have used computers programs to simulate the evolution of strange attractors. These computer programs can display each moment of a system’s chaotic behavior as a point of light on the screen and enable one to observe how the system evolves. When observing such systems on a computer screen, one would see that the system twists and meanders unpredictably across the screen, hardly appearing in the same spot again. But, as one observes, this chaotic behavior knits into a pattern, and order emerges on the screen. The result is that the chaotic movements of the system have formed into a shape, which is a “strange attractor,” and what appears on the screen could be described as the order inherent in chaos (Ref.^[10], p. 116). On the whole, strange attractors evoke feelings of wonder and astonishment for most people who watch them.

There are various well-studied strange attractors, the most famous of which is Lorenz’s attractor. This attractor emerged from the study of equations used in the prediction of weather.

Ed Lorenz, in his 1963 presentation, determined that simple systems of three differential equations can have complicated attractors. The Lorenz attractor, which has the shape of butterfly wings, graphically illustrates the notion of sensitive dependence as a representation of chaos. Lorenz demonstrated that his attractor was chaotic, because it exhibited sensitive dependence. Moreover, his attractor was also

“strange,” which made it a fractal.^[11] The term strange attractor generally refers to most chaotic attractors. However, some argued that the term “strange attractor” should be reserved for attractors that are “geometric” strange, e.g., fractals. There are instances in which chaotic attractors are not strange.^[12]

FRACTALS

Fractals deal with shapes of infinite detail. They can be used to illustrate geographical boundaries of a nation, the bifurcation or dividing of a river’s delta, cloud formations, and so on. A fractal “allows us to define and measure accurately the property of roughness.”^[13]

Benoit Mandelbrot, who has conducted extensive research on fractals, defines a fractal as “a rough geometric shape that can be subdivided in parts, each of which is a reduced size of the whole.”^[14] Mandelbrot introduced the term fractal as a means of dealing with the problems that arise while studying scale in the real world.^[15] While exploring the iteration of complicated process equations with mathematical tools such as sines, square roots, etc., Mandelbrot devised a set of complex mathematical objects that became known as the Mandelbrot set.

To Benoit Mandelbrot, a fractal is a way of coping with problems of scales. He described a fractal as “any curve or surface that is independent of scale—a property described as *self-similarity*,” which implies that any portion of the object, if magnified, “would appear identical to the whole.”^[15] Self-similarity is an even arrangement across scale. Its images are identifiable everywhere, in culture, in the reflection of a person standing between two mirrors, or in the sketching of fish eating a smaller fish. It entails patterns within patterns. Objects that display self-similarity exhibit details in such fine scale as well as produce constant measurements (Ref.^[7], p. 103).

The notion of self-similarity in fractals is a way of “seeing” infinity, which could easily be illustrated as iterations of a scaling process as shown in Fig. 1, or by taking the middle of an equilateral triangle and attaching a new triangle that is one-third in size with identical shape. This will increase the number of points in the object thus formed, from three to six. When the

Fig. 1 Illustrates self-similarity by a simple iteration of a cross-shaped object. Each segment of the object from b to d will look identical to a, if magnified. Constructed by David Ogula ©.

process is repeated by attaching a smaller triangle, the points increase from six to 12 and so on to infinity. The resulting shape is similar to a snowflake.

Fractal shapes such as those shown in Fig. 1 and the well-known Koch curve, show self-similarity in that any portion of the object will look identical to the whole when enlarged. While Euclidean one-dimensional lines fill or occupy no space, the outline of the above shape or the Koch curve, which has a finite length crowding into finite area, fills space. In fact, a fractal literally means self-similarity (Ref.^[7], pp. 98–100).

The pioneering work of Mandelbrot and others gained wide acceptance over time, leading to the application of fractals in describing shapes, scales, and dimensions. Mathematicians, engineers, and other scholars began using fractals to graphically illustrate the capacity for “self-reference”—a key concept in the study of complex dynamic systems. In such systems, instead of spinning off in different directions, each part of the system maintains harmony with itself and with all other parts of the system as it changes, maintaining a deep relationship between individual activity and the whole.

In recent years, there has been tremendous interest in the field of fractals. They have been applied to complex physical shapes from mathematical shapes, to illustrations in the social sciences, management and administration, and even the sound of music. Some musical artists are currently using fractals to generate basic melodies in their compositions.^[16]

One of the key concepts in the study of fractals is that of “fractal dimension,” which provides a way to measure the roughness of fractal curves. As more scholars studied fractal dimensions, they began to wonder about the dimension of coastlines, mountains, and national boundaries. Mandelbrot, on his part, argued that any coastline is, in a sense, infinity or, in another sense, depends on the length of the measuring instrument.

Fractal dimension can be viewed as a way of measuring qualities that apparently have no clear definition, i.e., the degree of roughness or irregularity of an object.^[8] The dimension of a fractal curve is a number that characterizes the way in which the measured length between given points increases as scale decreases. There is evidence that fractals have also been used to store photographic quality images in a tiny fraction of the space ordinarily needed.^[17] Thinking of fractal dimensions makes one wonder how the twists and turns of a coastline could be measured (Fig. 2). For example, one begins to wonder how long is the coastline of Britain, or how long is the coast of the Eastern United States from Maine to the Florida panhandle.

If we directly measure the eastern coastline of the United States, we would find discrepancies with existing estimates of the length of the coastline. The eastern

Fig. 2 The fractal nature of a shoreline, showing the degree of irregularity of the Eastern coastline of the United States. Constructed by David Ogula ©.

seaboard of the United States, like most shorelines and national boundaries, goes up and down, with rocks, hills, cracks, and curves. A measuring device that is straight and hard like a ruler would give a value of length different from another device that is made of material that can bend and curve over such uneven surfaces. Thus, “fractals can be characterized by the way in which representation of their structure changes with changing scale.”^[16]

Another concept in the study of fractals is Fractal Geometry, which deals with “geometric forms used for building man-made objects”—made up of “lines, planes, rectangular volumes, arcs, cylinders, spheres, etc.” These objects originate from Euclidean geometry, and they “can be classified as belonging to an integer dimension, either 1, 2, or 3.”^[14]

As the literature on fractals shows, there are different types of fractals, but fractals are not just necessarily curves. There are important differences between fractal curves and the ideal curve that is normally applied to natural processes.

Morgantown, West Virginia, U.S.A.*

INTRODUCTION

Auditing is fundamental to providing assurance that information is creditable, and creditable information is fundamental for accountability. An audit is an examination. Although there are many types of audits, this explanation is primarily about financial statement and financial-related audits of state and local governments. In these audits, assertions are examined on a test basis, and accounting principles and estimates are assessed. Based on the collection and evaluation of evidence, the auditor renders an opinion about the financial statements and, for governments, sometimes issues additional reports. Fair presentation of financial statements is judged relative to established criteria set forth in generally accepted accounting principles (GAAP). For many governments, additional reports address the adequacy of internal controls and compliance with policies, contractual agreements, grant provisions, regulations, and statutes.

AUDITS

Purpose of Audit and Types of Opinions

A financial statement audit provides assurance that an entity's financial statements are presented fairly. The financial statements are prepared and owned by the entity being audited or auditee, and embody the assertions of that entity. By applying appropriate audit processes and observing auditing standards, the auditor evaluates the auditee's assertions relative to established criteria. From the assurance provided by the auditor of fair presentation, the users of reports may hold the auditee accountable.

From conducting an audit, the auditors may disclaim an opinion on the financial statements or issue one of three types of opinions: unqualified, qualified, or adverse. An opinion is disclaimed when an auditor does not have sufficient evidence to express an opinion. An unqualified opinion indicates that financial statements are fairly presented in accordance with GAAP.

If an entity's record of financial performance is poor, it may receive an unqualified opinion if its financial statements fairly reflect its poor financial performance. Many rules guide the distinction between a qualified opinion and an adverse opinion. In general, a qualified opinion indicates that, except for a deviation from GAAP, the financial statements taken as a whole are presented fairly. An adverse opinion indicates the financial statements taken as a whole lack of fair presentation.

Responsibility for Fraud

To reach an opinion, the auditor must plan and execute a financial audit to obtain reasonable assurance that management's assertions are free of material misstatement, whether due to error or fraud. Even when audits are executed in accordance with due professional care, there are no guarantees that all fraud will be discovered, particularly when management sets out to deceive the auditor, and others. However, if an allegation of fraud has been made, a fraud audit should be performed; this is a separate type of engagement from a financial audit.

Concept of Entity

The concept of entity is central to financial reporting and auditing. The bounds of entity establish the activities reported in financial statements. State and local governments are familiar reporting entities. The financial statements of a governmental reporting entity include the activities of the primary government, such as a city, and of component units that have financial accountability to the primary government, such as a city school board. All the activities reported in general purpose financial statements (GPFS) are subject to examination under a financial statement audit.

Reporting entities and accounting entities may have different bounds. Any entity for which a distinct set of financial statements is prepared is an accounting entity. Thus, a discretely presented component unit

or a fund, such as the general fund, is an accounting entity. In contrast, the GPFS of a reporting entity may include data from many accounting entities.

A reporting entity's GPFS may be issued separately or as part of the entity's comprehensive annual financial report (CAFR). Supplemental and statistical information in the CAFR, that is additional to the financial statements, is not subject to audit.

AUDIT ACTIVITIES

Differences Between Auditing and Accounting

Although financial statement auditors must understand accounting, it is the reporting entity that is responsible for its accounting and preparation of its financial statements in accordance with GAAP. For state and local governments, the primary authoritative bodies for promulgating GAAP are the Governmental Accounting Standards Board and the Financial Accounting Standards Board.

Because auditors assess the fair presentation of financial statements, they must have a sound knowledge of GAAP. But unlike accountants, auditors also must have a strong knowledge of auditing standards and procedures that set forth the means for conducting an audit.

Types of Audits

Generally accepted governmental auditing standards (GAGAS) address two types of audits: financial audits and performance audits. Financial audits include financial statement and financial-related audits. Financial statement audits pertain to the fair presentation of financial position, results of operations, and cash flow in conformity with GAAP. In contrast, financial-related audits pertain to the disclosure of information, adherence to compliance requirements, and suitability of internal controls.

Performance audits include economy and efficiency audits and program audits. The objectives of an

economy and efficiency audit are to assess the economical and efficient acquisition, protection, and use of resources; to identify inefficient and uneconomical practices; and to determine if the entity has complied with relevant laws and regulations. In contrast, the objectives of a program audit are to evaluate the extent to which desired results and benefits are achieved, to assess the effectiveness of operations, and to determine compliance with applicable laws and regulations.

Performance audits are directed to evaluating efficiency and economy of programs or to evaluating the effectiveness of program results. Thus, auditees are frequently selected on the bases of potential for saving costs or improving results. Legislative bodies often have agencies that perform performance audits at the request of members or committees. At the federal level, the General Accounting Office (GAO) serves this function. In addition, the GAO includes standards for performance audits in *Government Auditing Standards* (Yellow Book). Table 1 shows the ways that performance audits differ from financial statement and financial-related audits.

Audits in Public and Private Sectors

Public sector refers to governments at all levels. Audited financial statements and information, along with the independent external auditor's report, contribute to the accountability imposed on government officials for the resources entrusted to them. Public officials, legislators, creditors, and citizens use the audited information and audit reports to determine whether government assets are properly accounted for and have been expended in compliance with relevant laws and regulations. Also, in the public sector, performance audits indicate whether government organizations, programs, and services are achieving their purposes and are operating economically and efficiently. Accordingly, information and audit reports for public sector auditing have a much broader scope than in the private sector. Results of both financial audits and performance audits in the public sector are available to the public.

Table 1 Performance audits

Performance audits	Financial statement and financial-related audits
Audits are preformed at irregular intervals	Audits are performed annually
Assertions may be vague or undefined	Assertions are well defined
A broad range of evidence is considered	Well-defined types of evidence are sought
The focus tends to be program specific	Financial statements reflect the entity as a whole
Auditors tend to have diverse educational backgrounds with strong knowledge of programs	Auditors tend to have strong backgrounds in accounting

Source: From Ref.^[3].

Most large organizations have an office or department of internal audit. Internal auditors are employed by the auditee, and generally report, by separate channels, to the highest level of management or administration within the auditee's organization. Internal auditors are expected to maintain an objective perspective and to provide assurance regarding the reliability of systems and data within the auditee's organization to its top officials. In contrast, external auditors work for public accounting firms or for special audit agencies, such as the office of a State Auditor or, at the federal level, the GAO. Internal and external audit functions are linked. The presence of an internal audit function serves as an internal control to enhance the reliability of information. Thus, a strong internal audit operation tends to reduce the level of assessed risk and accordingly reduces the amount of audit resources required to conduct an external audit.

Private sector refers to business entities. However, the only businesses required to have financial statement audits by external independent auditors are those businesses that trade securities on an organized stock exchange and are regulated by the Securities and Exchange Commission (SEC). These businesses are called public companies because their stock trades on an exchange that is open to the public. Hence, the term, public companies, has a meaning distinct from public sector governmental entities. Likewise in the professional designation, certified public accountant (CPA), public refers to holding one's self out to render services to the public rather than being an employee of a public sector governmental entity. Results of financial statement audits of public companies within the private sector are public information and are used primarily by current and potential stockholders, financial analysts, creditors, and customers for business decision making. Regardless of sector, financial statement audits attest to the fair presentation of information rather than to the quality of management's decisions or the soundness of an investment.

Conduct of Audits

There are three basic phases in a financial audit—the planning stage, the execution of the plan along with evaluation of results, and report writing. Developing an audit plan is an extremely complex task requiring knowledge of prior audits and a thorough understanding of the auditee's operation and environment. With this knowledge, the auditor assesses the inherent or business risks associated with the auditee and structures an audit plan based on assessed risk.

In addition, the plan addresses any uncorrected recommendations made by the auditor in prior years for known material findings. Once the initial plan is

established, the auditor executes the plan and documents all evidence as a basis for drawing conclusions. As the audit progresses, each piece of new evidence is evaluated with respect to the audit objectives of the relevant procedure. Such evidence is compared with other evidence and conclusions drawn in preceding audit procedures. When this comparison produces conflicting evidence, resolution of the conflict may require an expansion of the initial audit plan. Thus, auditing is a reiterative process. When all steps in the plan are completed and the auditor is satisfied with the sufficiency and competency of the evidence to support conclusions, a report is written and communicated to the auditee.

SINGLE AUDITS

Purpose

Any government or non-profit organization that expends over a threshold amount in federal awards from more than one program must have a single audit. The single audit is not distinct from a financial statement audit, but is an extension to it. Thus, the organizationwide single audit serves as a basis of opinion on financial statements and as a basis for judging that federal awards are used in an appropriate manner in accordance with contractual and legal requirements.

The single audit approach was adopted as a way to improve financial management, conduct uniform audits, promote efficient and effective use of audit resources, and ensure reliable audits. Rather than being audited on a grant-by-grant basis for each separate grant, recipients are subject to a single organizationwide audit. This one single audit satisfies all federal agencies. Thus, the duplication of having many agencies separately auditing a common recipient on a grant-by-grant basis is avoided.

Standards and Reports

Single audits are conducted in accordance with generally accepted auditing standards, GAGAS, and single audit standards. [Table 2](#) indicates the standards, the standard setters, and primary source of guidance issued by standard setters. The American Institute of CPAs (AICPA) is a private national professional organization, the Office of Management and Budget (OMB) is a federal executive agency, and the GAO is a federal legislative agency. In addition to its roles in establishing GAGAS and conducting other activities, the GAO is responsible for audits of the financial statements of federal agencies.

Under the rules for a single audit, six reports must be issued in addition to the auditor's basic opinion on the financial statements. The term, financial-related auditing, refers to the work that supports the additional reports required by a single audit. In contrast to the opinion on financial statements that is directed to the financial statements taken as a whole, the additional reports required in a single audit tend to be directed to major federal financial assistance programs. The extra reporting requirements of the single audit focus on the adequacy of internal controls and compliance with contractual, regulatory, and statutory requirements. Internal controls refer to the plans, procedures, and actions of an entity to ensure compliance with its policies, and with regulations and laws to which it is subject; to enable the evaluation of operations and personnel; to ensure reliable data; and to protect its assets. Although a single audit does not require testing for illegal acts, the auditor must report any illegal acts that are discovered. The auditing standards that apply to specific reports are shown in Table 3.

The Office of Management and Budget first implemented the concept of the single audit in 1979. Subsequently, it was adopted by statute with enactment of the Single Audit Act of 1984 and then amended in 1996. Single audits are administered by OMB, which issues circulars that provide guidance for performing audits. By statute, single audits must be conducted in accordance with GAGAS of GAO. Periodically, GAO issues amendments that are codified as part of its *Government Auditing Standards* (Yellow Book).

REGULATION OF AUDITS

Public Interest in Regulation

The strong public interest in auditing derives partially from a lack of direct economic exchange and, in a governmental setting, partially from the need for stewardship over public funds. In the acquisition of audit services, there is no direct exchange between the

auditor and the external user of audit reports. It is the auditee who employs and pays the auditor rather than the external users of reports. Thus, to accept the creditability of audit report, the user must have a high level of confidence in the auditors, the standards they observe, and the procedures they employ. The public interest in stewardship is evidenced by the many single audit requirements that emphasize compliance with policies, regulations, and statutes. Report users who are dissatisfied with the work of an auditor may make their dissatisfaction known to the auditee, pursue a complaint with a state board of accountancy or federal oversight agency, or bring suit against the auditor in court. For a discussion of the role of auditing in society, see *The Audit Society*.^[2]

Stakeholders

There are many stakeholders with an interest in government audits. Two of the primary stakeholders are parties who participate in the municipal bond markets and federal agencies that disburse funds to auditees. Present and potential investors in municipal bonds are concerned about the receipt of bond interest and ultimate repayment of bond principal. These investors rely heavily on the judgment of bond raters who review financial statements, audit reports, and a lot of other information in making their evaluations. Federal agencies are concerned that federal funds expended by state and local governments are spent in appropriately authorized ways. Other stakeholders with an interest in financial information and audit reports include public administrators, legislators, taxpayers, and citizens, in general.

Role of Independence

Independence of the auditor is critical to the audit. The independent auditor must be independent with respect to financial connections and to managerial decision making. In particular, the independent auditor must not be involved with the auditee in a way that enables the auditor to make managerial decisions that subsequently are examined under audit. If the auditor is not independent from the auditee in mental attitude and in appearance, the creditability of the audit report and of the audited financial information is so severely damaged that neither the report nor financial statements may be regarded as legitimate.

The core of all independence requirements is that the external auditor be financially independent from the auditee and not involved in managerial decision making for the auditee. Auditors must comply with rules, regulations, and laws adopted by various authorities. These authorities include the GAO, state boards

of accountancy that license CPAs, the AICPA, and the SEC. As required by GAGAS, CPAs and other professionals who audit under the Single Audit Act must be free from personal and external impairments with the auditee, and must maintain both an independent mental attitude and independence in appearance.

Additional independence requirements apply to CPAs. When CPAs are performing an audit or other attest engagement with respect to financial statements, they must comply with the laws and regulations of the relevant state with regard to independence of the auditor from the auditee. For CPAs who are members of the AICPA, they must also comply with its rules regarding independence. When a CPA audits a business that is under the regulatory authority of the SEC, the CPA is said to practice before the SEC. To practice before the SEC, CPAs must show that they are in good standing with their state board of accountancy and in compliance with SEC rules regarding independence.

QUALIFICATIONS AND CERTIFICATION OF AUDITORS

Education of Auditors

Independent audits of financial statements may be performed by CPAs or by persons employed by independent audit agencies of governments. Most independent auditors have a Bachelor's degree in accounting or its equivalent. Maintaining a license as a CPA generally requires the completion of continuing professional education (CPE) on an annual basis. Specific CPE requirements are imposed for all auditors who participate in single audits.

Certification of Auditors

All CPAs are certified and licensed by state boards of accountancy. The requirements for certification vary among the states and may be obtained from the National Association for State Boards of Accountancy or a state board of accountancy. To be certified, an auditor must meet an educational requirement to take the CPA exam and pass the CPA exam. Many states have gone beyond requiring a bachelor's degree to require a minimum of 150 credit hours to sit for the CPA exam. An additional requirement for licensing is to obtain relevant experience of a certain type and duration. Maintaining a license then requires the completion of CPE.

Oversight and Peer Review

Auditors conducting a single audit must provide federal oversight officials with access to their working

papers that document the conduct of the audit. To ensure and promote quality work, members of the AICPA who have clients regulated by the SEC are subject to the peer review processes of the AICPA. In addition, some states require a peer review for licensing of CPAs.

TRENDS IN AUDITING

Influence of Information Systems

In today's environment, most financial information and statements are produced using complex electronic information systems. Thus, auditors must assess the reliability of these systems before accepting evidence from such systems as a basis for an opinion on the fair presentation of financial statements. That is, the validity of substantive evidence can be only as reliable as the system that produces such evidence. Effective systems must have physical and logical access controls to programs and data, processing controls, change controls, maintenance policies and procedures, and authoritative oversight. Accordingly, financial auditors must be technologically competent with respect to computerized financial systems and frequently must be able to engage information systems auditors to conduct effectiveness tests of system controls. Evidence on the effectiveness of the system will guide the financial auditor in planning the audit and in gathering substantive evidence on which to base an opinion on the fair presentation of financial statements.

Continuous Audits

Continuous audit refers to procedures and practices employed on a continual basis throughout the year

that are intended to provide ongoing assurance to decision makers about the quality of information they are receiving. Traditional financial statement audits are performed annually with much of the audit work done after the auditee has prepared a set of financial statements. On completion of the audit, a report or set of reports are issued at one point in time about one set of annual financial statements. In today's environment, the annual audit supplies a small part of the total information available to decision makers. However, most of the other information available to decision makers is not audited by independent auditors and is not regulated by authoritative bodies. Accordingly, regulators and standard setters believe that there is a demand for more timely information than that provided by the annual audit of annual financial statements. In addition, decision makers most likely will expect independent external auditors to provide continuous assurances on both financial and non-financial data and on the effectiveness of the systems that produce the continuous flow of information. For more information about this new approach to auditing, see *Continuous Auditing*.^[1]

RESEARCH METHODS AND ISSUES

Methods

Various methods are employed in the conduct of auditing research. Subjects tend to be auditors, auditees, and users of audit reports. Data are often collected from subjects by means of experiments, surveys, and interviews. Other rich sources of data are archival stores of financial statements, audit opinions, regulatory reports to the SEC, and stock and bond market information. Much research centers around one or more

hypotheses that reflect a possible association between or among variables. It is common to employ statistical methods in testing for associations.

Issues

The relationships suggested by hypotheses often connect auditing to the disciplines of psychology, economics, and finance. Some of the dominant questions in auditing research are as follows: What variables influence the behavior and/or judgment of auditors, of personnel and directors of the auditee, or of audit report users? What is the nature of the market for audit and other assurance services? What variables influence market pricing, the quality of audit services, and the response of financial markets to audit opinions? How effective are various audit procedures, regulatory processes, and management practices within auditing firms? Many accounting-related professional and academic periodicals publish auditing research. *Auditing: A Journal of Practice and Theory* (American Accounting Association), an academic journal, disseminates auditing research exclusively. Four important practitioner journals are *The CPA Journal* (New York State Society of CPAs), *Internal Auditor* (Institute of Internal Auditors), *The Journal of Accountancy* (AICPA), and the *Journal of Government Financial Management* (Association of Government Accountants).

Influence of Internet

The Internet has affected the performance of audits, expanded research resources, and introduced new means to improve the proficiency of auditors. Using the Internet during the conduct of audits, auditors may rapidly exchange information among themselves and with the auditee. Government policies, programs, and publications may be researched using the Internet. Many academic and professional periodicals are available electronically and may be searched easily. As a means of resolving problems, auditors may participate in discussion groups and listservs. One issue relating to the information via the Internet is whether the source is reliable and verifiable. Another issue is the confidentiality of transmission for certain information. Auditing-related web sites are listed in [Table 4](#).

Balanced Scorecard for Public Administration and Policy

Peter J. Reed

Bannock Consulting, London, U.K.

INTRODUCTION

In an influential series of articles in the *Harvard Business Review*^[1–3] and best-selling books from Harvard Business School Press during the 1990s^[4,5] Robert S. Kaplan and David P. Norton introduced and developed the idea of the Balanced Scorecard. The essence of their argument was that financial accounting measures are no longer sufficient as true indicators of the worth or the health of companies or their corporate performance. Most financial measures were developed to measure the effectiveness of investment in tangible physical resources and assets. In today's information economy, and particularly in what can be termed "knowledge-based organizations," they are inadequate indicators to account for the true value (or growth in such value) of essential intangible assets such as customer satisfaction and loyalty, employee skills and motivation, and intellectual or information capital.

Most companies, and probably all public sector organizations, already monitored nonfinancial measures, but in general, Kaplan and Norton's contention was that managers tended to focus more heavily on aggregate financial measures as if, somehow, these could accurately reflect the efficiency or effectiveness of operations performed by staff at all levels of the organization. The Balanced Scorecard was designed, therefore, not just to introduce the importance of "balance," but also to draw attention to the usefulness of nonfinancial measures that inevitably drive long-term success. By the same token, employees that are exposed to the concept (for example, by participating in organizational self-assessment workshops, or even through the publication of indicators, targets, and results) will be able to see the financial consequences of their actions—especially those geared directly to the improvement of internal processes.

Public sector organizations necessarily have a different perspective concerning the customer value proposition. Their "stakeholders" are normally taxpayers and their stewardship of public money has to be with a view to maximizing efficiency and demonstrating this good management of resources through transparency and public accountability. There is no profit motive, and no requirement or expectation to produce an increase in share value, or a return on investment in conventional corporate terms. They were, therefore,

among the early adopters of the Balanced Scorecard, recognizing that it could provide both a strategic performance measurement system and a framework to capture and summarize results for publication. Having in many cases already espoused Quality Management principles, and award schemes for quality standards like Investors in People, they were quick to realize that this was a useful and complementary addition to their "toolkit" of methodologies for managing continuous improvement of service delivery.

THE ORIGINAL FOUR PERSPECTIVES AS APPLIED TO THE PUBLIC SECTOR

Learning and Growth

This perspective looks at the ability of public employees, the quality of information systems, and the effects of organizational alignment in supporting accomplishment of organizational goals for excellent service delivery. Processes will only succeed if adequately skilled and motivated public employees, supplied with accurate and timely information, are implementing them. This perspective takes on increased importance in public service organizations that are undergoing radical change. Even learning to regard the public as valued clients or customers has necessitated a major paradigm shift in many countries and cultures, both at the national and at the local levels of service delivery. In order to meet these changing requirements and customer expectations, employees may be asked to take on dramatically new responsibilities, and may require skills, capabilities, technologies, and organizational designs that were not available before. Many senior civil servants did not even think of themselves as managers, let alone "leaders" until quite recently.

Internal "Business" Processes

This perspective focuses on the internal process mechanisms, and the results of these that lead in turn to financial viability and satisfied customers just as they do in the private sector. To meet organizational objectives and customers' expectations, organizations must identify the key "business" processes at which

they must seek to excel. Key processes should then be (and now frequently are) monitored to ensure that outcomes will be satisfactory. Internal operational processes and the efficiency of their performance are the mechanisms through which the public's expectations concerning standards of service delivery are achieved. The problem often arises in civil and public services that the processes are perceived as being set in stone, only relevant internally, and not connected to customer convenience. This malaise is not, of course, confined to the public sector. In fact, in the public sector they are often set in print in weighty volumes with archaic and bureaucratic systems for annual amendment, which may or may not take place. Ministerial or departmental mandates, protocols, regulatory frameworks and procedures, are frequently tied up in "red tape." This is usually just because they always have been, and employees have traditionally been expected to see these "standard operating procedures" as somehow sacrosanct, rather than to question them or suggest improvements for greater efficiency or customer satisfaction.

Customer, Client, or User Focus

This perspective captures the ability of the organization to provide quality standards of services, effectiveness of their delivery, and overall customer convenience and satisfaction. In the government or public service model, the principal driver of performance is different from that in the strictly commercial environment. Here, customers and stakeholders take pre-eminence over financial results. This is not to say that financial prudence is not fundamentally important. In general, public organizations have a different, perhaps greater, stewardship, fiduciary responsibility, and focus than do private sector entities. Financial responsibility for sound fiscal and expenditure management policy and strategies should, of course, be taken seriously by bureaucrats. The public as stakeholders (like share- or stockholders in this respect) expect it; but it should never be at the expense of the quality of the services that are provided within budgetary constraints.

Ensuring that policies, strategies, and operations have a positive impact on society is, of course, more obviously a prime consideration for the public services whose very existence and *raison d'être* is predicated on this. Finding metrics by which to measure this, and the trend over time, should, therefore, be a concern for leaders in all such organizations. Client Service (or Citizens') Charters have gone a long way in demystifying the language of policy, and to clarify just what government is offering its stakeholders and to what standard they have a right to expect the delivery of services.

The Balanced Scorecard can be used effectively to benchmark these standards and enable political leaders to report honestly to the public on progress with policy intentions.

Financial or Key Performance Results

In the government arena, the "financial" perspective therefore differs from that of the traditional private sector. Private sector financial objectives generally represent clear long-range targets for profit-seeking organizations, operating in a purely commercial environment. Financial considerations for public service organizations have an enabling or a constraining role, but will rarely be the primary objective for "business" systems. Success for public service organizations should be measured by how effectively and efficiently they meet the needs of their constituencies. Therefore, in the government arena, the financial perspective emphasizes cost efficiency, i.e., the ability to deliver maximum value to (and as perceived by) the customer.

THE MALCOLM BALDRIDGE (USA), EFQM EXCELLENCE (EU), AND MODERN COMPTROLLERSHIP (CANADA) MODELS AND FRAMEWORKS

The Malcolm Baldrige Quality Award scheme in the United States and the Excellence Model from the European Foundation for Quality Management (EFQM)^[6] appeared on the scene at around the same time as Kaplan and Norton's publications. Indeed, the Malcolm Baldrige Award was first introduced in 1987, and so predated these. Rather surprisingly there is very little in the literature—either from EFQM or from the Malcolm Baldrige Award Foundation (or the Baldrige National Quality Programme—BNQP, or the National Institute of Standards and Technology—NIST) to acknowledge Kaplan and Norton's contribution, or vice versa; so it is difficult to be certain about the original source of the DNA.

In any event, both EFQM and the Baldrige movement in America quickly introduced refinements of the scorecard with more criteria—differentiating between a wider range of Enablers that drive improvement, and Results that augment measures of purely financial performance. Currently, the Baldrige model has seven criteria, and the EFQM Excellence Model has nine.

The Baldrige model's criteria or categories are:

- Leadership
- Strategic planning
- Customer and market focus
- Measurement, analysis, and knowledge management
- Human resources focus

- Process management
- Business results

The EFQM Excellence Model's criteria are divided into five Enablers and four Results Areas as follows:

Enablers

- Leadership
- Policy and strategy
- Human resources management
- Resources (and partnerships)
- Processes

Results

- Customer results (satisfaction)
- People (employee) results (satisfaction)
- Impact on society
- Key performance results (including financial performance)

BUILDING A SCORECARD

Public service organizations—just like their private sector counterparts—can choose whether to use one of the tried and tested framework models, whether to populate Kaplan and Norton's original four perspectives with appropriate measures for their operating environment, or whether to design their own scorecard based on the essential fundamental principles of balance, interdependence, and cause-and-effect linkages. If they decide to use either of the Baldrige or EFQM models (or the Common Assessment Framework derived from the latter) they will find a wealth of material available freely in the public domain, most notably prompts for a comprehensive list of self-assessment questions for management teams to ask themselves when assessing their current performance under the criteria headings. Managers should be aware, however, that a balanced scorecard is potentially as important for informing and mapping strategy (summarizing this diagrammatically in concise, convenient form) as it is as a benchmarking instrument.

If an organization's management team decides to use the original four-category model for their scorecard they need to do more than choose some measures and sort them into the four perspectives. Measures should be chosen in order to inform what are considered to be the key elements of strategy. Kaplan and Norton emphasize that the measures must also fit together, identifying three important principles that should underpin the design:

1. *Cause and effect*: The measures must relate to each other and tell a story that shows how

activities to enhance individual and organizational learning and growth can improve internal processes. This will strengthen the customer value proposition (leading to customer satisfaction), which, in turn, should ensure that financial and other key indicators of performance for achievement of the organization's mission are met (the financial or key performance results perspective).

2. *Lead and lag measures*: Two types of indicators should be chosen. Measures of customer satisfaction, for example, are useful but are after-the-fact indicators that do not necessarily tell you how to get better. To back up such *lag* measures, *lead* indicators, such as response times, quality measures, participation rates in staff training programs, and so on, are necessary because they cause, lead to, or predict customer satisfaction.
3. *Financial effectiveness*: Even in the public sector where "return on investment" is not measured in the same way as it is in business, managers (and ultimately politicians) need to be able to demonstrate that "return on assets employed" is as efficient, and the strategies employed as effective, as they can be to offer best value for money to the taxpayer.

In Canada the Treasury Board of Canada Secretariat has developed Modern Comptrollership. This is a management reform and philosophy involving public service values, sound risk management, integrated performance information, and appropriate control systems. The first step is to establish a baseline using a self-assessment framework diagnostic tool "Modern Comptrollership Capacity Assessment." The model for this is slightly more sophisticated than the CAF and the process is designed to be more time consuming. It has seven key criteria for assessment, for which the methodology provides detailed descriptions of awareness and actual management behavior reflecting five standards for approaches and results. These seven key areas (which, in turn, break down into 33 subcriteria) are:

<i>Core criteria</i>	<i>Enabling criteria</i>
Shared values and ethics	Strategic leadership
Mature risk management	Motivated people
Integrated performance information	Clear accountability
Rigorous Stewardship	

The Treasury Board's information in the form of a web brochure insists that this Capacity Assessment "is not a scorecard." This seems a strange assertion,

because, to all intents and purposes, it is, and a very good one too.^[9]

MULTIPLE SCORECARDS

Many management teams will quickly see the benefit of having at least one Balanced Scorecard to facilitate high-level strategic planning and performance benchmarking. If the organization is large enough, “federal” in structure, or decentralized, it may well be seen as appropriate for individual departments, units, or branches to have their own scorecards. In such cases, these should, of course, either be logically cascaded from the higher-level corporate scorecard, or the latter should be distilled from aggregation of the essential elements and outputs of such departmental tools.

INTANGIBLE ASSETS

In this context, it is important to stress that an organization’s intangible assets (such as knowledge and information) are at least as important as its tangible assets and probably more so. Kaplan and Norton contend that the secret of long-term value creation is the conversion of intangible assets into tangible outcomes by describing and measuring the critical few parameters that represent the strategy and managing these. In their view, it is important to attempt to identify measures for human capital, information capital, and organization capital, which describe exactly how the Learning and Growth Perspective can be strengthened.^[7,8] In aggregate, these could be seen as an “intellectual balance sheet” the “worth” of which is likely to be far more influential for value creation in a public service organization than bricks and mortar, desks, computer hardware, fleets of vehicles, sheer numbers of employees, or even financial resources per se.

Together, measures for these aspects of organizational capital constitute what we could call organizational readiness—for change, for the challenges of measuring performance improvement, and for achievement of the mission. Understanding and knowledge about these must be pushed down and out into the organization because the people who do the work need to know not only what they should be doing, but also to what standard, how they will know this, and how they will be recognized or rewarded for making the extra effort required.

There needs to be an understanding of the “flows” around a scorecard from box to box. To be effective it *must* be used to manage and not just to monitor. In the current climate this is what makes it difficult for companies (and perhaps even the public sector as well) to justify “returns on investment” (or efficiency savings)

that are less rapid or dramatic in scale than the investors (or politicians or taxpayers) had hoped for or expected. Nevertheless, many visionary firms do indeed outperform share price indices and always have done so by engaging in long-term capability building, so it is naive to suggest that markets simply do not allow companies and corporations to build for the future because of an all-pervasive short-term profits and earnings focus. By the same token, it should be possible for public service organizations to maintain commitment to the medium-term strategy (if this is well founded on the need for increased learning and growth) despite the pressure of continual short-term “value for money” assessments and audits.

One of the reasons that effective leadership is so important in such examples is that it is easy to manage by the scorecard in relatively easy times; but when the going gets tough, it takes leaders with real and extraordinary commitment and belief not to fly back to the financial box and do whatever is necessary to make savings or keep results good in the short term. It can help if the overall performance reward framework can be linked to all stakeholders in the scorecard (not just shareholder or financial stakeholder value, although using the scorecard should ultimately drive through to better results here too).

APPLYING A PROVEN METHODOLOGY

While it is perfectly possible to design your own bespoke scorecard, many organizations will prefer to adopt and perhaps adapt a tried and tested methodology. This approach will usually ensure the capture (and translation to measurement when required) of an organizational strategy across a wide variety of strategic and operational situations, as the models (like the basic scorecard) are essentially generic. The organization’s management will need to consider at this point whether they wish to use the balanced scorecard alone as their principal model to develop overall strategy (to be captured in a strategic or business plan). They may prefer to use the scorecard to ensure a comprehensive and holistic systems overview, and to identify areas for improvement, using a more conventional strategic planning model with which they may already be familiar to formulate the main strategic objectives. In either case, it is possible to use the scorecard regularly thereafter (perhaps at six-monthly or annual intervals depending on the pace of change) for actual “scoring” or benchmarking of continuous performance improvements in all chosen perspectives, once the team has determined the priorities for attention and action planning.

Arguably, balanced scorecards should be used frequently for monitoring and managing operational measures, especially with the role of translating

strategy into action. This will avoid the situation where the management team look at the financial indicators on a daily, weekly, and monthly basis, but consign the nonfinancials to an occasional check.

David Norton's own consulting firm, Renaissance Solutions Inc., which he cofounded in 1992, advocated a four-phased approach in designing a bespoke balanced scorecard measurement system for clients.

Step 1: Defining Suitable Measures

Because the Balanced Scorecard should reflect the strategy, an organization must develop a *distinct* strategy. A business strategy and a Balanced Scorecard that describes it are not random. Experience has shown that the architecture of a Balanced Scorecard has several dimensions. A good design process will recognize these dimensions and provide frameworks to guide the architect and the executive team in their thinking about the strategy. There are frameworks that describe the strategy and represent the foundation on which a complex design is based. For example, in the financial perspective, one could frame discussions about the three primary components of a financial strategy:

1. Revenue growth/mix
2. Productivity or efficiency
3. Asset utilization and expenditure management

Whether operating a private sector business firm or a public service organization, executive teams use this framework to anchor their financial objectives. Similar frameworks for the Customer, Internal Processes, and Learning and Growth perspectives will give the management team a basis from which to consider the setting of strategic objectives.

The Canadian Treasury Board has also produced a "Management Accountability Framework" with realistic expectations, indicators, and suggested measures that comprehensively integrate the many management-focused initiatives currently underway and the vision and ethics they share.^[10]

Step 2: Build Consensus Around Strategic Objectives

It is common and normal for a management team not to share full consensus on the relative importance of its strategic objectives. Even harmonious management groups in well-managed organizations will often lack a shared understanding about the overall strategy and the relative roles of different groups within the organization and this can keep the team from agreeing on priorities. The second step of the development process is designed to build consensus among the members

of the executive team around the long-term strategic priorities of the organization. To achieve this goal, each executive team member should attempt to capture his or her implicit and explicit strategies for the business. These personal visions are then synthesized into feedback that is reviewed at an executive workshop. During this session, the executive team learns about where there is and is not consensus about their strategy and discusses unresolved issues. Ultimately, a coherent group vision for the organization emerges in the form of 10 top priority objectives.

Step 3: Select and Design Measures

With the prioritized strategic improvement objectives agreed upon by the executive team, the next step is the selection of measures to track the achievement of these objectives. Subteam working sessions focus on the development of measures for a subset of the objectives, finalizing the wording of objectives and searching for measures appropriate for tracking each objective. At the end of this step, the subteams synthesize their recommendations into a united "strategic story." With agreement on the strategic objectives and measures, the Balanced Scorecard measurement system design is complete.

Step 4: Develop the Implementation Plan

For a Balanced Scorecard measurement system to create value, it must be integrated into the management system of the organization. The final step of the process entails three primary tasks:

1. Identifying the current practices in various management processes
2. Evaluating opportunities for integrating the BSC into the management process
3. Developing an implementation plan

This step typically reviews the organization's approach to data reporting and review, management meetings and decision-making, strategic learning, strategic communication, personal objective setting, and planning and budgeting.

UNLOCKING THE STRATEGIC BENEFITS

Companies and government organizations that have been using the Balanced Scorecard for some time and have successfully integrated the tool into their management processes are beginning to see significant financial and operational results. Managers describe the intangible benefits gained from being able to "understand

the drivers of business success” and “educate the organisation, deciding how, when and where to raise the bar.”

By developing a Balanced Scorecard that truly tells the story of the desired strategy, it is possible to set the foundation for a management system that is capable of driving dramatic improvements in performance.^[7,8]

Balanced Scorecard Tools for Organizational Assessment in Public Administration and Policy

Peter J. Reed

Bannock Consulting, London, U.K.

INTRODUCTION

Traditional financial metrics (as summarized in a balance sheet) do not capture the full or the true value or worth of any organization, but they most obviously fail to do so in the field of public services. It is now widely recognized that they are also inadequate as sole arbiters of success in the private sector. This is most evident in “knowledge-based” organizations for which people (whether we see them as “intellectual capital” or “human resources”), technology, and an organizational climate of innovation and learning are essential to support any strategy.

The “Balanced Scorecard” is a proven approach to strategic management that was originally conceived to embed long-term strategy into the management system through the mechanism of measurement. The concept was originally developed in 1992 at Harvard by Robert S. Kaplan and David P. Norton and became immediately influential with managers of private sector companies and corporations.^[1-7] In fact, the public sector, worldwide, has been just as receptive in recognizing that effectiveness and efficiency were the keys to their particular stewardship of financial resources. The Balanced Scorecard translates vision and strategy into a set of prioritized objectives that effectively communicates strategic intent, and it motivates employees and tracks performance against the established goals. It has consequently become the foundation of a number of benchmarking systems to track both the degree and the rate of continuous improvement in standards of service delivery. Because of its holistic design concept, it can, however, prove to be an excellent framework model for all improvement initiatives. The process of using it to “score” performance and the score itself are actually secondary in importance to the understanding and insights that the model can generate for strategy formulation and strategy mapping through the encouragement of systems thinking.

This paper introduces the concept of the Balanced Scorecard as a self-assessment tool for organizational development in the public services. It describes how the use of one version of this, in its manifestation as the Common Assessment Framework (CAF), has helped governments in many countries to monitor

and evaluate the progress of their performance improvement initiatives.^[8] In the case of public services that are subject to modernization or reform programs, such self-assessment could follow on from structural and functional reviews. Alternatively, it could precede such a review and could inform restructuring where this is deemed desirable for continuous improvement in service delivery. The paper also touches briefly on key requirements for the success of such an initiative.

THE NEED FOR A HEALTHY BALANCE

Balance suggests a steadiness that results when all parts are properly adjusted to each other, when no one part or constituting force outweighs or is out of proportion to another.

—*Webster's Third New International Dictionary*

This definition of balance provides the essence of an overview of what constitutes a healthy organization. In the same way, performance management and measurement systems must achieve a balance that recognizes that there is more to life (and management) than financial results alone: a view that supports progress against predetermined objectives, without suboptimization. This view has encouraged an understanding that organizations are more organic than mechanical. They cannot be simply re-engineered. Rather, they benefit from an approach that is more akin to a holistic health and fitness regime. Continuous improvement toward excellence can be planned. It can be project managed and integrated into daily operational activities; its effectiveness can, and must, be measured if learning from it is to inform future strategy.

SUCCESSFUL PERFORMANCE MEASUREMENT AND MANAGEMENT

Various groups, including the National Partnership for Reinventing Government in the United States (See “[Bibliography](#)” at the end of this article) the Cabinet Office in the United Kingdom, and the

Innovative Public Service Group in Europe, have found that there are certain attributes that set apart successful performance measurement and management systems. The following is a summary of their common conclusions:

- A conceptual framework is needed for the performance measurement and management system.
- Effective internal and external communications are the key to successful performance measurement.
- Accountability for results must be clearly assigned and well understood.
- Performance measurement systems must provide intelligence for decision makers, not just compile data.
- Remuneration rewards and recognition should be linked to performance measurements.
- Performance measurement systems should be positive, not punitive.
- Results and progress toward program commitments should be openly shared with employees, customers, and stakeholders.

PERFORMANCE MANAGEMENT SYSTEM GOALS

The following are the reasons a leading-edge organization seeks to create an efficient and effective performance management system:

- To translate vision into clear measurable outcomes that define success and that are shared throughout the organization and with customers and stakeholders.
- To provide a tool for assessing, managing, and improving the overall health and success of business systems.
- To continue to shift from prescriptive, audit- and compliance-based oversight to an ongoing, forward-looking strategic partnership involving the organization and any partners with whom it transacts its business operations.
- To include measures of quality, cost, speed, customer service, and employee alignment, motivation, and skills to provide an in-depth yet holistic and predictive performance management system.
- To replace existing assessment models with a consistent approach to performance management.

THE BALANCED SCORECARD APPROACH

Leading organizations agree on the need for a structured methodology for using performance measurement information for the following reasons:

- To help to set agreed performance goals.
- To allocate and prioritize resources.

- To confirm or change current policy or program directions to meet those goals.
- To report on success in case of meeting those goals.

Governments and agencies throughout the developed world have adopted variations on the Balanced Scorecard methodology as their chosen methodology for informing and deploying strategic direction, communicating expectations, and measuring progress toward agreed objectives. The Balanced Scorecard is a conceptual framework for translating an organization's strategic objectives into a set of performance indicators distributed among the following four perspectives:

- Financial
- Customer
- Internal business processes
- Learning and growth

Some indicators are maintained to measure an organization's progress toward achieving its vision; others are maintained to determine the long-term drivers of success. Through the Balanced Scorecard, an organization monitors both its current performance (finance, customer satisfaction, and business process results) and its efforts to improve processes, motivate and educate employees, and enhance information systems—in fact, its ability to learn and improve.

THE COMMON ASSESSMENT FRAMEWORK

The CAF is a result of cooperation among the EU ministers responsible for public administration. On request from the Directors General of this field, the new version of the CAF has been developed by the Innovative Public Service Group. It is available in the public domain, and the European Institute of Public Administration has a section of its website devoted to providing support to users who can also post their results on a database administrated by The European Institute of Public Administration (EIPA), should they wish to do so for the purpose of international benchmarking. (See www.eipa.nl and go to Projects/CAF in the menu.) Acknowledgment is due to EIPA for the following description.

A pilot version of the CAF was presented in May 2000 during the First European Quality Conference for Public Administrations held in Lisbon. The present version is based on experience gained in implementing and using the first version of the CAF.

The CAF is offered as a tool to assist public sector organizations across Europe to use quality management techniques to improve performance. It provides a simple, easy-to-use framework, which is suitable for a self-assessment of public sector organizations.

The CAF has four main purposes:

1. To capture the unique features of public sector organizations.
2. To serve as a tool for public administrators who wish to improve the performance of their organization.
3. To act as a “bridge” across the various models in use in quality management.
4. To facilitate benchmarking between public sector organizations.

The CAF has been designed for use in all parts of the public sector, applicable to public organizations at the national/federal, regional, and local level. It may also be used under a wide variety of circumstances, e.g., as a part of a systematic program of reform or as a basis for targeting improvement efforts in public service organizations. In some cases, and especially in very large organizations, self-assessment may also be undertaken in a part of an organization, e.g., a selected section or department.

The structure of the CAF is based on the Excellence Model developed by the European Foundation for Quality Management (EFQM) and is illustrated below (Fig. 1).

The nine-box structure identifies the main aspects requiring consideration in any organizational analysis. Within each of these boxes, a list of criteria is provided. The criteria identify the main issues that need to be considered when assessing an organization. The freely available CAF materials provide comprehensive lists of questions to prompt management teams to ask rigorous questions for each of the criteria. Using the CAF thus provides an organization with a powerful and well-proven framework to initiate a process of continuous improvement.

The CAF provides:

- An assessment based on evidence.
- A means to achieve consistency of direction and consensus on what needs to be done to improve an organization.
- An assessment against a set of criteria that have become widely accepted across Europe.
- A means to measure progress over time through periodic self-assessment.
- A link between goals and supportive strategies and processes.
- A means to focus improvement activity where it is most needed.
- Opportunities to promote and share good practice within different areas of an organization and with other organizations.
- A means to create enthusiasm among employees by involving them in the improvement process.
- Opportunities to identify progress and outstanding levels of achievement.
- A means to integrate various quality initiatives into normal business operations.

To summarize, self-assessment against the CAF model offers the organization an opportunity to learn more about itself: where it is now in terms of performance and standards of service delivery and how it believes it can improve in measurable ways.

The CAF has the advantage of being compatible with the EFQM model and may, therefore, be a first step for a public service organization wishing to go further with quality management. The materials available are essentially self-explanatory, but many organizations find it helpful and beneficial to have the first baseline assessment facilitated by an experienced consultant or practitioner who is thoroughly familiar with

(Based on the EFQM Excellence Model diagram)

Fig. 1 The CAF model.

the methodology, its uses, and the best way to present the team's findings to politicians or to the government.

Key Outputs of CAF Self-Assessment

A self-assessment exercise will normally be conducted by the management team and can be done comfortably in two working days. There will be two main outputs.

A Score. The first workshop will produce a baseline score against which future assessments can be benchmarked. The scoring system is internationally recognized and accredited. Indeed, there is an international database (held by the EIPA in the Netherlands), where it is possible to register results, and if desired compare them with others at a similar stage of development, or indeed with best practice organizations.

A List of Areas for Improvement. This is potentially more important than the score because it should inform strategy. Typically, around 100 areas for improvement (AFIs) will be identified across the board of the model (an average of 10–12 per criterion). When consensus is reached concerning which of these should be developed into priority improvement projects (maintaining the spread and systemic balance in the final selection if possible), a “vital few” should be incorporated into annual operational plans, and their process and project management monitored and used to improve organizational learning about what works best to improve service delivery standards.

Practical Benefits of the Methodology

Self-assessment using CAF can be conducted as a follow-up to a functional review or it can precede and inform such an analysis. It can form a very useful step in the process of conducting a situation analysis as a part of the strategic planning process for a department (or indeed any organization). For example, managers often find it difficult to frame a “picture” or comprehensive description of the desired medium-term future state of affairs. Often, the complexity of the current reality seems depressing and the problems all-pervading. In such cases, the model provides a useful framework and a well-tested set of prompts in the form of questions for the management team to help them formulate such a description.

1. Use in such a situation analysis or functional review (and gap analysis between a “picture of the future” and “current reality”) will typically identify 100+ areas for improvement—at least 10 per criterion that will help to:
 - a. Link outputs, processes, and inputs.

- b. Prioritize actions—within and across criteria.
2. It shows what good practice looks like and provides:
 - a. A broader systemic view of performance—highlighting interdependencies and the need to measure more than just budget compliance.
3. It involves staff in continuous improvement:
 - a. It improves internal communications—highlighting knowledge sharing.
4. It provides a management framework to:
 - a. Link political intent to local operations.
 - b. Add structure to other initiatives (especially any improvement or change initiative).

Key Strengths of the Methodology

The model's enablers inform:

- Sound broad-based strategy development and deployment.
- Good employment practice.
- Sound financial management.

The results criteria provide:

- Focus on client/customer perceptions and impact.
- Comprehensive financial measures.

OWNERSHIP AND RESPONSIBILITY

Self-assessment using CAF, or any other Balanced Scorecard model, is essentially a strategic exercise. It is designed to inform strategy and action planning. Therefore, just like other major change initiatives, it is important that the process is seen to be “owned,” sponsored, and led by senior line managers. In fact, so far as there is an important policy dimension—which is after all the foundation of any strategies that are to be developed—there is no reason why politicians (secretaries of state, ministers, or deputy ministers) should not take part, or at least take a serious interest. This sends out a message, if one is needed, that there is a sense of urgency, and that staff and stakeholders should note that this is an important and serious initiative designed to catalyze the changes necessary to improve performance and value for money.

There is certainly a vital component of the exercise that relates to staff development. Results, after all, can only be achieved through people. In this context, it is most welcome that many government departments are now upgrading the status and responsibilities of HR departments or units. Managers need to show, however, that they recognize and understand that HR units are not responsible for staff development—only for coordinating this. The responsibility for developing

people should rest squarely with line (senior) managers, and should be based on the emerging organizational priorities from strategic and operational plans, and from the CAF assessment.

Unfortunately, the concept of such line “managers” is new for the governments of many developing countries, and so HRM units may have to take the lead in the establishment of HRD strategies, and in identifying skills gaps that emerge from initiatives such as the self-assessment benchmarking process. The recommendations of any diagnostic studies—for example, training needs’ analyses—should be taken in the context of all the other conclusions, for instance, from functional review, and aligned with those relating to HRM that will emerge from the identification of AFIs when self-assessment benchmarking using the CAF commences.

SUMMARY—PERFORMANCE AND QUALITY MANAGEMENT USING BALANCED SCORECARD SELF-ASSESSMENT AS AN ORGANIZATIONAL DEVELOPMENT SYSTEM

- Performance management is a system within a larger system. To get maximum benefit, managers must pay attention to the whole process, not just a part of it. Organizational self-assessment is as important as individual appraisal.
- Performance management links up with strategic planning, budgeting, employee development, employee compensation systems, and quality improvement programs. The more links that are established between performance management and other processes in the organization, the better the return on investment. The linkages and interdependencies between the criteria “boxes” in the model and the information flows are, in fact, as important as the criteria themselves.

TEN KEYS TO SUCCESS

- Political or senior management “ownership”
- Honesty (about current reality)
- Openness (to achieve consensus)
- Making the exercise “blame free” (analysis and monitoring should simply track performance and improvement)
- Avoiding excuses/justification

- Showing cause and effect linkages where possible (or acknowledge that these are complex and nonlinear)
- Recognition of commitment
- Alignment with strategic and operating plans
- Selection of a vital few action priorities from AFI
- “Quick Win” projects to turn this analysis into action and results.

INTRODUCTION

Changing markets, globalization of economies, technological pressures, and competitive positions are necessitating the need for innovative management practices not only in the private sector, but also in the public sector and its administration. Due to heightened public awareness and also as a matter of good public policy, public sector organizations are being increasingly challenged to achieve the highest levels of performance. Although the definition of performance may be difficult to establish for the public enterprises, they are increasingly expected to perform better, and to deliver more to their various stakeholders and constituents with lesser resources.

Since the 1980s, the private sector for-profit enterprise management has changed significantly, thanks in part to the various modern management practices, such as strategic management, Just-In-Time (JIT), business process reengineering, lean and agile manufacturing, total quality management (TQM), and benchmarking (BM). With a time lag, public enterprises have also implemented these strategies and techniques for improving their performance and efficiency.

Benchmarking is becoming an increasingly popular tool for transferring best practices into the public sector. It has also been used effectively as a tool to control and scrutinize the mission effectiveness and the underlying generic service processes of non-profit public enterprises (PEs). It facilitates a radical change in the organizational culture, and supports continuous and sustained efforts toward improvement. It is a positive and proactive process; however, it can easily turn into a negative and reactive process, especially for the PEs, if the controlling authorities use BM for measuring performance alone.

The main significance of BM lies in its ability to identify and unearth the best practices, from anywhere and anyone. The key emphasis is on learning from others and not trying to reinvent the wheel. Openness and ability to adapt and change are the major ingredients of the BM process.

Market-based economy is generally accepted as the appropriate model for global and national economic development. However, the public sector organizations will continue to deliver critical services and play a significant role in any economy. Just like the private sector, the PEs are equally driven by the concerns of cost, efficiency, and responsiveness toward their stakeholders. However, unlike the private sector, it is difficult to identify suitable measures of performance in PEs. Further, dependence on public-funded, fixed, short-term budgets creates its own peculiarities and political imperatives. Nonetheless, BM in the public sector has proved to be equally, if not more, successful. Considering the importance of BM in PEs, this article attempts to review some of the literature with the objective of understanding the major issues in performance improvement and discussing the application of BM in PEs. A framework for BM in PEs has also been outlined. It is hoped that this article will serve as background work for further research in this area.

BM AND PEs

American Productivity and Quality Center (APQC) defines BM as “the process of identifying, understanding, and adapting outstanding practices from organizations anywhere in the world to help your organization improve its performance.”^[1] Camp^[2] defined BM as “the continuous process of measuring products, services, and practices against the toughest competitors or those companies recognized as industry leaders. (It is a) search for the industry best practices that will lead to superior performance.” Thus, the BM process is focused on continuous performance improvement by identifying, understanding, and adapting the best practices both inside and outside the organization.

Benchmarking improves overall efficiency of the organization. A typical large business enterprise can have significant payback within the first year of BM.^[3] It integrates easily into the strategic management of the organization through its emphasis on

continuous improvement of quality and learning culture. BM facilitates the organization in achieving its strategic objectives and makes them more knowledge based. It forces organizations to move away from internal performance measurement and toward adaptation and learning. Although BM is well integrated with TQM and continuous improvement, it does not conflict with the other ongoing efforts of performance improvement.

The continuous process of documenting and sharing BM efforts promotes the core value of learning and openness necessary for continuous improvement and growth. Further, it forces organizations to become more outward looking and to seek new challenges with the spirit of overcoming new challenges. It improves the overall competitiveness of the organization not only by making its business processes more efficient, but also by actively promoting the learning and continuous improvement culture, which is much needed in the rapidly changing environments. Exposure to the outside world and interaction with BM partners also helps PEs to identify new areas of opportunities, improve their overall mission effectiveness, and achieve cost reduction and efficiency.

Benchmarking is equally applicable to different service processes within any organization—profit or non-profit, private or public. The approach has been successfully applied in manufacturing, sales, service, training, and educational organizations. In the private sector, top managers are always aware of the environment and are constantly comparing (consciously or unconsciously) their organizational performance with others. Benchmarking formalizes this process for PEs and changes the primary management focus from “outcomes” to the enablers of the outcomes. In the public sector, BM has been used successfully as a tool for measuring organizational performance, bringing in the best managerial practices, and learning from other organizations. However, there remain some skepticism and resistance to organizational change, along with a certain level of mistrust in the public sector about the ready adaptability of private sector management practices to the PEs.^[4]

It is quite likely that the industry best practice may not be easily revealed due to transaction and other search costs. Only relative or local optimum benchmarks may be established to bridge the perceived gaps in performance.^[4] Benchmarking can also be achieved against well-established industry practices, instead of searching for the external best practices. For example, DIN ISO 9000-9004, quality awards, and Citizen Charters can be equally effective in BM in PEs. Quality award competitions promote superior performance by fostering innovation and quality. The generic administrative practices of participating agencies become more transparent and open to public scrutiny,

thereby forcing them to strive for superior performance. Citizen Charters, quite popular in Europe, focus on the idea of accountability in PEs. They are used for assessing and rewarding quality in PEs. It is a quality checklist having the sanction and authority of the state with the stated objective of improving the delivery of public service to the citizens. However, BM is considered a superior approach as compared with the traditional target-setting approach for managing performance.^[2]

The BM process is a paradigm shift requiring a sea-change in the organization's practices, culture, and structure. The focus is on adaptation, not on adoption or mere imitation. The classic example in BM is that of Henry Ford, who adapted the Chicago slaughterhouse practices to develop the assembly line approach for automobile manufacturing. It is most effective when applied as a tool of continuous improvement within the context of a larger change initiative.

Although an easy case can be made for growing “managerialism” in the public sector, with the stated goal of transferring the best managerial approaches/practices of the private sector to the public sector, it may not be all that easy. It is easy to apply bottom-line and customer-driven approaches in the management of private business enterprises. However, similar measures for PEs are difficult to identify. Even the customer satisfaction approach may be questionable in some cases. Here, the uniqueness of BM stands out. The private sector is driven by competition, and BM introduces an element of cooperation with the BM partners. Yet, in the context of PEs, BM introduces an element of competition—they are forced to compare themselves with others and to improve.

IMPLEMENTATION OF BM PROJECTS

Total commitment, support, and understanding of the top management for BM is the most critical ingredient for successful implementation of the BM process. Besides providing support to the BM team and encouraging involvement at all levels, top management also needs a good understanding of internal business processes and the process of BM itself.

Benchmarking becomes more powerful when combined with change initiatives and used as a tool for continuous improvement. It has yet to become a core value in itself for the organization. However, there is a clear understanding that the best practice is a moving and ever-evolving target. There is no single best—it is relative and contextual.^[5]

Benchmarking requires an organizational culture that encourages openness to new ideas and eagerness to seek best ideas from any source. It requires active willingness to seek BM partners within and outside

your own industry. Obviously, it is a two-way street and requires openness to share your own practices with your partners. In terms of attitude, the BM approach can be summed up as, “We want to meet and beat the best known performance in any process.”

Adequate time and resources need to be allocated for BM projects. However, there has to be a strict cost–benefit analysis at every stage to ensure significant positive contributions and to not waste resources on marginal issues. Not everything can be benchmarked, and the PEs have to choose carefully the areas for BM process.

Like any implementation barriers, BM has its own impediments during the course of performance measurements and identifying best practices. Some of them include inertia and resistance to change, cost, response time, temptation to copy, focusing on performance measurement rather than the processes and practices that result in superior performance, lack of involvement by top management, and organizational structure and culture that punishes mistakes made while innovating. Lack of adequate support, time, and resources are identified as primary obstacles in successful implementation of BM.^[1]

A FRAMEWORK FOR BM IN PEs

Performance measurement in the public sector is more difficult than in the private sector because simple concepts of financial measurements cannot be applied. It is not feasible to apply the usual measures of profitability to the public sector. At the same time, it is equally difficult to operationalize the concept of “consumer satisfaction.” The problem of scarce resources in public sector administration necessitates a certain degree of insensitivity to consumer demands. In other words, consumer satisfaction cannot be the only, or dominating, dimension in performance measurement in the public sector.^[4]

Technology, globalization, competition, and collaboration have completely transformed business processes in the public sector. This calls for a different approach to BM for PEs in terms of its responsiveness to mission objectives. The BM champions also have to take advantage of the possibilities offered by technology in terms of communication, conferencing, and search. However, at the same time, one has to be careful about the reliability of the search results because the barriers to entry in the information dissemination are much lower. Further, by carefully defining and limiting the scope of the project, BM can deliver quicker results.

An effective way to control cost is to select only a few processes at a time for BM. One need not benchmark all the areas at once. The step-by-step approach will also help to leverage the experience and results gained from the initial phases.

Under the present environment, there is a greater need for analyzing the service processes before launching a BM project. First, the process of internal service process mapping itself will reveal several ideas that can make the process more efficient. Second, a thorough understanding of the internal service processes will reduce the total project time by focusing on core service processes.

Mission Effectiveness

The goal of any PE is to fulfill its mission or charter, whereas the business enterprises seek profitability. Therefore, the key performance metric for a PE at the strategic level is *mission effectiveness*.^[6] This concept can be compared with the strategic competitiveness in the corporate sector. The mission effectiveness for the PEs is not fixed, it is relative and contextual. The mission and underlying sub-missions may change their tone and dominance, depending on the political and social pressures on the PEs.

Political Issues

The existence of a business enterprise is solely determined by its economic performance. However, for a PE, its existence is often determined by a political process, which in turn depends on various sociopolitical factors at a given time. Further, some public agencies in the area of public safety or law and order might even receive a higher dose of resources, even when not able to provide the expected deliverables. Thus, the life of a PE may be much more dependent on its sociopolitical relations with its environment than on improved or worsened performance. At the same time, public pressures and fiscal constraints may impose certain performance targets (Citizen Charters in Europe) on PEs. However, BM is considered to be a better approach to manage performance than the traditional target-setting approach.

Cost Reduction and Efficiency

Profitability measures, so common in business enterprises, cannot be readily applied to the PEs. However, some financial measures such as cost reduction and efficiency can be used to establish best practices. Efficiency measures can also be financial or non-financial. For example, capacity utilization ratios, total passenger journeys per year per staff hours, and so on, can be used to measure efficiency of a metropolitan mass transit system.

Thus, if performance is the factor for the viability of a PE, effectiveness and efficiency of its operations

are the key indicators to be examined and improved. While it may be relatively easier to set up metrics and subject them to BM for generic support functions, it may not be so easy to set up metrics for mission-specific effectiveness and to benchmark them. When faced with internal or external targets and imprecise measures of effectiveness, measures of economic efficiency and cost reductions will dominate the BM performance metric.

Customer Satisfaction

It seems easy to select customer service as one area that may be common to PEs enterprises. Both should strive for better customer service. However, “even here there is a difference, because the definition of customer is different in the two cases.”^[6] Besides, the concept begs the question—who is the customer? The user of the service or the ones funding the PE (the taxpayer)? Further, even if the consumer of the service is accepted as the customer, it may be optimal to allow a certain amount of dissatisfaction as part of the mission.^[4] For example, it may be desirable to leave the recipients of public dole a little bit dissatisfied with the service to coax them away from systemic dependence on public welfare.

Stakeholders

In the case of business enterprises, business owners can easily be identified as the primary stakeholders. However, for PEs, it is difficult to identify one major group of stakeholders. By definition, PEs exist for the public good. Taxpayers and founders of the PEs, regulators, legislators, and the general public have a stake in successful mission accomplishment. The various stakeholders may not have a unified vision for the PE and its mission, thereby making the exercise of performance measurement and BM extremely fractious.

Open Information

In business enterprises, information is often protected due to the fear of losing the competitive advantage through the loss of intellectual property. Among PEs, generally, it is easier to secure cooperation and open communication. However, the information may still be guarded due to legal, security, and safety concerns.

Uniqueness

For a business enterprise, being unique can be a success factor. However, because competition is generally

not an issue for PEs, sameness and economies of scale are more important than being different from others.

Club v. Out-of-the-Box Approach

Because competition is usually not an issue for PEs, it is easier to form “innovation rings” or consortia of similar PEs to foster innovation and to learn from each other. The managers are more comfortable sharing the information with each other in such clubs. The knowledge transfer is easier due to the shared language and technologies.

However, such clubs can easily degenerate into mutual back-scratching clubs trying to establish excuses for their poor performance. A certain amount of “soldiering” can also take place. Nonetheless, such clubs can help to quickly establish in-class best practices.

Out-of-the box or “world-class” out-of-the-class BM processes can be helpful in establishing the best practices at a global level. This approach is especially useful when establishing best practices for generic business processes.

Information Technology

Information Technology is both the enabler and enforcer for BM. Advances in information technology (IT) and communication technology have lowered the costs for identifying and transferring best practices and monitor their implementation. The IT advances can assist in readily evaluating the impact on all aspects of an organization, both in detailed and aggregated levels. Knowledge management tools, such as Enterprise Resource Planning (ERP) systems, will continue to evolve and provide management even better controls over the service processes.

However, in the case of PEs, IT can become a stumbling block due to the lack of adequate investment in IT, inability to attract and retain the right kind of personnel, and the need to constantly upgrade and reconfigure. Often, IT can become a hinderance rather than a facilitator of BM. Sometimes, IT itself can become a key area for BM for the PEs.

GENERIC STEPS FOR BM IN PEs

Jarrar and Zairi list six major steps in BM for transferring the best practices—searching, evaluating, validating, implementation, review, and routinizing.^[5] Some of the major aspects that one should consider in BM practices include top management involvement, team, BM partners, networking, consultants, proactive approach, change champions, cost-benefit analysis, and continuous improvement.

The following are generic steps that can be used in the BM process in PEs:

1. *Choose the core service processes that need to be benchmarked.* The related question is “how do the selected processes fit into the overall mission of the organization from the stakeholders’ perspective?” Senior management support and understanding of the process is critical to BM. However, in the case of PEs, this may be problematic because the locus of real power may lie outside the organization.
2. *Select a team with well-defined scope and team leader.* The team should have adequate influence throughout the organization. Because the power structure in PEs is generally more centralized and most of the authority is concentrated at the top level, it is imperative that some members of the top management join this team to provide support and leadership to the project. This kind of highly visible team composition is also essential for post-BM activities. In short, the team has to become the change champion.
3. *The team scope should include a timeline for deliverables.* This issue becomes even more relevant in today’s fast-changing, quick-response environment. The team should be fully responsible for training, providing assistance and guidance, and transferring and sharing the knowledge within the organization. The team may also need adequate training and resources to carry out the process.
4. *Time and resources have been identified as primary challenges to BM; adequate budgeting is necessary.* Innovative funding techniques that involve different agencies and partnership with the private sector may be necessary. The organizational culture in PEs is different from the corporate sector—it is generally more bureaucratic and resistant to change. Therefore, the BM may not be able to deliver immediate short-term returns.
5. *Engage an outside consultant.* If there is not enough in-house expertise or understanding of the issues involved in BM then it may be necessary to engage an outside consultant who has a proven track record of BM in similar areas.
6. *Analyze and understand the core service process thoroughly before looking elsewhere.* This analysis itself will reveal significant insights into the current operations and help to improve the service process. Benchmarking essentially relates both inside and outside the organization.
7. *Adopt a strict protocol (Code of Conduct) for sharing information and proprietary knowledge with the BM partners.* This is critical not only for satisfying the concerns of your potential BM partners but also to avoid any potential antitrust, ethical, or legal issues. Well-established and tested protocols are readily available, and can be easily modified and adapted to meet the specific needs.
8. *Identify potential BM partners within or outside the industry.* It is not always necessary to work with the best-in-class performing organizations. One can also learn from less-than-the-best performing organizations.
9. *Establish an open communication link with your potential BM partners.* If the potential BM partners believe that a partner is trying to steal their ideas, then there will be no positive response. Networking through professional and trade organizations can be extremely valuable in this process.
10. *Identify core areas of service that need to be improved through BM.* Develop a few key performance measures and a suitable metric that can be used for the BM process. This metric will have to be developed in close cooperation with the BM partners.
11. *Identify the best practices in the key performance measures from BM partners.* Here, the focus should be on understanding the underlying processes that lead to the best practices. The team should distill the best practices for adaptation by the organization. Mere imitation or copying does not work.
12. *Perform a cost–benefit analysis to see if it is worthwhile to adapt such practices.*
13. *Share the results and the knowledge gained through this exercise throughout the organization on a formal basis.* Organizations involved in BM generally miss out on the opportunity to take full advantage of the potential gains, in learning and changing the culture, that can arise from sharing the knowledge gained in BM.
14. *Adapt, implement, and monitor the identified improvements in the service processes.*
15. *Perform periodic followup to evaluate the impact of improvements initiated by BM.* The evaluation should include achievement of financial and strategic objectives. Such a followup will help to further improve the process by internal BM. It will also help to leverage the BM process throughout the organization by promoting the learning culture—the fundamental focus of BM.

Benchmarking is not merely a process of measuring the best performance. The primary focus has to be on identifying business practices that lead to superior

performance, and determining how such practices can be adapted and emulated within the organization in a cost-effective manner. In other words, learn from examples set forth by others.

CONCLUSION

The research clearly indicates that BM has earned its place as a management tool and will continue to be used in the future.^[1,3,5] It is a fundamental process that promotes learning and change, thereby improving the overall efficiency and mission effectiveness of PEs.

Benchmarking is the most economical method to improve productivity and efficiency of any organization. However, it requires a sustained long-term continuous effort and cannot be a quick fix. The growth in the academic and practitioner literature in BM is indicative of its momentum and potential.

Application of BM in the PEs requires careful fine-tuning, specifically in the involvement of top management, identification of measures of mission effectiveness, and a commitment to a continuous and sustained effort toward service process improvement. The organizational culture, time, and resources can become major stumbling blocks. Certain PEs might even enjoy a limited amount of monopolistic powers due to their political right to exist and may not have any incentive to improve.

Benchmarking in PEs is a viable management practice with considerable potential for making a significant improvement in the performance in an economical manner without reinventing the wheel.

Biomedical Ethics and Public Policy Discourse

John Abbott Worthley

*Department of Public Administration, Seton Hall University,
South Orange, New Jersey, U.S.A.*

INTRODUCTION

Developments in medical technology during the latter part of the twentieth century revitalized the field of biomedical ethics. As the twenty-first century unfolds, broad availability and application of this powerful technology have brought the biomedical ethics dialog foursquare into the public policy-making forum. The issues being deliberated are both organizational and clinical. This article illuminates the questions being debated including political, economic and organizational issues. Specific attention is given to stem-cell research and end-of-life issues. Questions of conflict of interest and decision-making power are raised.

THE NATURE OF BIOMEDICAL ETHICS PUBLIC POLICY DISCOURSE

The clinically related issues for public policy fundamentally revolve around one of the oldest questions of bioethics: Should we do everything that we can do? Specific attention-getting issues include human cloning, stem-cell research, fertility technology, euthanasia, and abortion.^[1] Technology has largely set the agenda. As the 21st century began, a Worcester, Massachusetts, company announced that it had successfully cloned human embryos. This technological development immediately called the question: Now that we can do it, should the polity permit, encourage, proscribe, or limit the cloning of human cells? Recent scientific research has also found that human cells harvested from embryos offer significant pathways to healing spinal-cord injuries, dementia, and other medical conditions. Should we fund stem-cell research aimed at curing such disabilities and diseases? Or should issues of fetal life prevail? At the end of the twentieth century, a 63-year-old woman was successfully fertilized in vitro through frozen embryo transfer. She gave birth to a 6-lb girl. Should senior citizen women be legally denied fertility therapy? Or, should the issue not even enter the public policy forum? Largely based on the availability of sophisticated pharmaceuticals, Holland in Europe and Oregon in the United States have developed regulations for hastening

the death of terminally ill citizens through the use of such drugs. Should public policy ban “mercy killing” or continue to develop regulatory procedures for applying technology to painful end-of-life circumstances?

Advocates on all sides are lobbying to have these kinds of questions addressed in the public policy-making process. As a result, for example, in the fall of 2001, the U.S. House of Representatives passed legislation, supported by the sitting president, banning all human cloning. In January 2002, a Presidential Council on Bioethics was appointed to advise the government on cloning and other issues. Stem-cell developments, organ selling and transplantation, as well as issues of nutrition and hydration for the terminally ill are among other subjects being addressed. The ethics of abortion, of course, has had a significant place on the public policy agenda for some time, both in the courts and in our legislatures.

Organizational issues have also entered the forum prompted by social and economic developments.^[2] Socially, the professional role of medical professionals has changed, and societal attitudes toward them have followed. Physicians have become powerful lobbyists, corporate officers of health-care organizations, and more group based than individual oriented. Nurses have unionized, entered managerial positions, and become more powerful in the health-care enterprise. Not surprisingly, consumer perspectives on these professionals have evolved. Deference to medical paternalism has diminished. Physicians are more routinely subject to legal processes for malpractice. Patients have become more alert to self-serving inclinations of physicians and less tolerant of medical hubris. As a result, discussion of truth telling, confidentiality, conflict of interest, and informed consent has proliferated, and public policies on these matters have been developed.

Economically, the escalated cost of health care has impelled debate on issues of resource allocation, fiduciary competence, insurance configurations, and compliance with standards and regulations. Is it ethical within the reality of limited resources to duplicate health-care services in defined geographic areas? Is it ethical to close an emergency room or a maternity ward to realize economies of scale within local communities? How should health-care resources—needed by

all but sufficient for only some—be distributed? Should limited resources be expended on expensive technologies that benefit relatively few or on more generic treatments that benefit many? How should such decisions be made? Should insurers be required to offer certain coverages and prohibited from some denials of coverage? Should health-care providers be monitored for strict compliance with standards and penalized criminally, as well as financially, for non-compliance? Should these questions be addressed privately or within the political process? Should answers become a matter of public policy? These are some of the concerns that have come to the fore in shaping modern bioethics discourse within the public policy context.

FUNDAMENTAL QUESTIONS

The public policy debate over these and other issues revolves around a few fundamental, timeless, and profound questions. The clinically focused debate inevitably centers on questions about human life. When does human life begin? What, in fact, constitutes human life? When does human life end? Should society directly intervene in the beginning and ending of life, or should society leave it to more natural processes? The abortion public policy-making experience, for example, is grounded in the question of when human life begins. The conclusion that life begins at conception leads to a public policy position to ban all abortion. The conclusion that viable life begins at the third trimester of pregnancy leads to a public policy position to fund abortion within limits and regulations. The conclusion that human life begins at birth leads, of course, to less restrictive abortion policy proposals. Perspective on the nature of human life enters the debate when prenatal screening reveals anomalies such as genetic defects. When deformities and abnormalities are viewed as a diminution of human life, policy proposals permitting late-term abortion tend to emerge. When a child is born in great distress, perspective on the end of life spawns views on policy for intervention or nonintervention.^[3]

Euthanasia policy dialog is largely rooted in conceptions of the nature of human life. Those who see a certain level of brain function as essential tend to seek policies permissive of euthanasia actions in situations such as a persistent vegetative state. Those who view the “human soul” as the essential factor seek proscriptive policies. Those who view physical well-being, such as freedom from continuous and severe pain, as essential to human life tend to propose less restrictive public policies. The emergence of technology for human cloning, of course, is now bringing the

question of the nature of human life to another level of discernment.

In recent years, the case of Terri Schiavo in Florida highlighted both the debate on the nature of human life and the role of the public policy process in that discourse. In addition to the patient’s family, courts, the state legislature, and even the U.S. Congress entered the discourse of whether or not a feeding tube could be removed ethically. The discourse was further complicated and enriched by the bifurcated role of the church in the matter: Some officials and theologians argued that a feeding tube is extraordinary and artificial (and, therefore, can be removed); others maintained that a feeding tube is now ordinary and natural and should not be removed.^[4]

State governments have entered the discourse arena with an array of policies that range from permitting health-care providers to remove life support even against family wishes to forbidding such action. Among the more permissive is the state of Texas, whose “futile care law” permits hospitals to withdraw life support from patients whose conditions have been deemed hopeless by the hospital. If the family objects, the law provides for a 10-day period in which to find another willing facility. Failing that the hospital is legally able to end artificial support.^[5]

The organizationally focused debate centers on questions of conflicting interests. Should the health-care interest of each individual person be the chief concern of bioethics or should the interest of society as a whole be primary? If both interests are viewed as essential, what should the policy be when the interests conflict? How do we honor the dignity of every person and still maintain the viability of the community? Because the health-care resources of the polity are less than the full health-care needs of all the individuals who form the community, how should allocation of the limited resources be directed? Should the finite health-care resources be allocated on cost-benefit principles of economics, on power and influence principles of politics, or on philosophical principles of the greatest good with the least harm? Who should make the decisions—ethics committees organized within health-care enterprises, medical experts organized through their professional societies, politicians elected by the masses, jurists organized in legal systems, insurers structured capitalistically and regulated governmentally, or philosophers organized academically? These are basic questions today, and, increasingly, the public policy-making process is being used as an arbiter for framing answers. Implicit in the discussion is a disconcerting issue—in policy decisions involving bioethics, whose judgment should ultimately prevail—the patient’s, the health-care provider’s, the jurist’s, the ethicists, or the judgment of the polity through the public policy-making process?

AN EXAMPLE OF BIOETHICS AND PUBLIC POLICY

Current developments in human cloning and stem-cell research, because they are markedly bringing the fields of bioethics and policy making into the public arena, provide rich fodder for better understanding the expanding intersection of biomedical ethics with the public policy process. The technology now enables society to produce human life outside normal reproductive processes and to improve human health through stem cells. The fundamental question is whether society should now use this new, profound capability or proscribe, limit, and/or regulate its application. The debate is spawning new insights on the nature of human life, as well as refining understanding of life's beginnings and endings.^[6] For example, because cloning and stem-cell research entail destruction of some embryos, the issue of protecting innocent human life is a hallmark of the discourse. Scientists are, therefore, active in clarifying distinctions of biological reality. Some are noting that parthenogenetically activated eggs used in stem-cell research cannot result in human birth and, therefore, do not fit into the notion of "conception." Others, while accepting the scientific distinction, disagree with the conclusion. They argue that these embryos are potential human life and, therefore, are sacred and deserving of protection. Perspective on the issue of the beginning of human life is, in effect, expanded from the idea of conception to the notion of potentiality. The public policy of protecting life is thus challenged.

The issue of the ending of human life is similarly germane in this dialog around cloning and stem-cell research. Is human life unnaturally ended when embryos are destroyed in the process of cloning? For those who judge in the affirmative, public policy concerning homicide comes into play. Of course, implicit in this dialog is the question of just what constitutes human life. Some ethicists see a significant distinction between eggs produced artificially from parthenotes and those embryos fertilized naturally. From this sense of the nature of humanity, these ethicists are arguing for public policies that prohibit the sale of human gametes but do not prohibit parthenogenetic cloning per se. Similarly, other ethicists distinguish individuality from personhood. They observe scientifically that the early embryo (called a blastocyst) is not individualized until about 2 weeks into its developmental process. At that point, they note that the organism has the human genome but lacks personhood. Extraction of stem cells for medical or therapeutic purposes can then be distinguished from cloning for reproductive purposes. Based on this sense of human life, they argue for public policies that ban reproductive cloning but allow medical cloning.

This dialog on cloning also illustrates the tension between the interests of the individuals and that of the community. The interests of the polity in defining and defending human life can easily lead to policies that conflict with the interests of individuals, who want reproductive assistance. Moreover, cloning and stem-cell therapy are expensive. Should limited public health-care funds be spent in these dramatic areas that benefit relatively few individuals, or would they more ethically be devoted to preventive health-care needs that benefit the community as a whole? Public budgetary policies face this question.

Additional organizational issues arise when public policy in this area focuses on regulation and limits on research. Would it be managerially possible to develop, monitor, and enforce such restrictions within ethical standards of competence and compliance? As cloning technology continues to evolve, these kinds of questions confront public policy with increasing insistence.

State legislatures have been central in the evolving discourse. In 2004, California enacted a law explicitly supporting stem-cell research with public funds. In 2005, Connecticut, Illinois, New Jersey, and Virginia took similar action. In 2006, Maryland's General Assembly passed a bill after several years of failed attempts, and its experience is particularly illustrative of the nature of the discourse of bioethics in the public polity. Key participants in the Maryland dialog were biotechnological corporations and research universities that stressed the economic factors and benefits involved. Equally outspoken was the Catholic church of Maryland, which stressed concerns of respect for life. In the end, political linguistics was paramount: The discourse that began years before with a prevalence of highly charged and sensitive verbiage evolved into a dialog that consciously avoided trigger words. The language of bioethics in the public policy process continues to evolve, and this development appears to be the key as public policy responds.^[7]

CONCLUSIONS

The subject of biomedical ethics will accelerate its expansion on the public policy-making agenda as the first decade of the twenty-first century proceeds. Continuing and increasing resource limitations auger a higher level of intensity in the area of managerial and organizational policies. Who should get how much health care and when, as well as where should they get it? These will be focal questions for policy makers. Technological advances are also likely to soar, presenting fundamental questions in ever-challenging ways to bioethicists and public policy makers alike. Responses in the form of new public policies arguably will reshape

society in some fundamental aspects. Bioethical analysis will continue to be essential, and its linguistic presentation may be the critical determinant of the policies that ensue.

Bond Ratings

Robert J. Eger

Andrew Haas

*Public Administration and Urban Studies Department, Georgia State University,
Atlanta, Georgia, U.S.A.*

INTRODUCTION

This article provides a broad overview of bond ratings. It includes the definition of a bond rating, types of bonds, the bond rating process, the history of bond ratings, why government entities get a bond rating, and what information is used to determine a bond rating. Information charts detailing bond ratings by each rating agency are provided.

WHAT IS A BOND RATING?

A bond rating is the assignment of a grade by a private bond rating firm as to the creditworthiness (risk of default) associated with a particular bond issue. It is an evaluation of the probability that an issuer will repay the principal and interest of a bond issue. Bonds are rated by private companies (bond rating agencies) that estimate a bond issuer's fiscal health and assess its capacity to repay obligations in a timely manner.

TYPES OF BONDS

Bonds are financial instruments issued to finance long-term debt. They are issued in two categories: general obligation (GO) bonds and revenue bonds.

General obligation bonds are secured by a pledge of the full faith and credit of the issuing government entity with the tax base of the issuing entity acting as collateral for the bonds. General obligation bonds are considered low risk and do not require high administrative costs. Most government entities are required to hold a referendum before they can issue GO bonds. This can delay issue of a bond but imparts voter consent for the issue.

Revenue bonds, such as housing or transportation bonds, are principally secured by user fees or service charges paid by users of a particular government service. They can be issued by special districts (such as housing or transit authorities) without a formal referendum. This allows for financing of projects that

generate revenue exogenous of principal revenue sources. They are generally considered to be more complicated and higher risk and therefore carry a higher interest rate than GO bonds.

THE BOND RATING PROCESS

The bond issuing government entity hires a bond rating agency when the decision to issue debt is made. All relevant information is sent to the rating agency and is combined with internal data sources and objective research to determine a rating for the bond issue. Quantitative and qualitative data are used to determine the rating. Factors taken into account when determining a credit rating cover four primary areas: economy, debt, finances, and management strategies. There is some variation in the factors based on the rating agency and the type of debt issued.

HISTORY OF BOND RATINGS

Moody's Investor Services was founded in 1909 by John Moody when he began rating railroad bonds. By 1910, Moody broadened his ratings to utility and industrial bonds. Poor's Publishing Company began as a journal reporting financial and operating statistics for most of the American railroads and entered the bond rating business in 1916. In 1941, Poor's merged with Standard Statistics to become Standard and Poor's Corporation (S&P). Fitch ICBA entered the ratings industry in 1924 as Fitch Publishing Company and merged with ICBA Limited in 1997.

When bond ratings were first issued, ratings agencies purchased information from municipalities and resold their analysis to investors in the form of bond ratings. This model changed in the mid-1970s with high default rates in the debt market. Investors wanted reassurance and issuers wanted ratings to bolster confidence in their debt issues. It soon became standard practice to have a credit rating for every debt issue. Information is now free to investors, with payment coming from the issuing government entity.

WHY GET A BOND RATING?

Government entities have a strong incentive to keep their overall bond rating high. A direct inverse relationship exists between the bond rating and interest rates paid on a bond issue. Government entities with high bond ratings have a lower cost of capital and those with low bond ratings have a high cost of capital. These higher costs come in the form of higher interest rates on bond issues. A rating that is too low can remove the government entity from the debt market completely. Decision makers are induced to keep expenses low to help maintain a high bond rating. As an indicator of a government's financial health, bond ratings can have significant influence on government operations. A low or declining rating can indicate that a government is experiencing financial difficulty and might be an investment risk. This increases the government's cost of capital. High or increasing bond ratings mean lower borrowing costs and an enhanced fiscal reputation.

One example of the influence of bond rating agencies is the fiscal crisis of New York City in 1975. Beginning in the 1960s, New York City government increased expenditures for many social welfare and service programs. A general population decline coupled with urban deindustrialization eroded the tax base. Taxes were raised but were not sufficient to compensate for the increased expenditures. In an effort to prop up its finances and pay for the new programs, short-term notes were issued by the city. This cascaded into a series of note issuances to pay back previous short-term notes coming due. The city was downgraded from investment grade to speculative-grade status ("A" to "Caa") by Moody's in October 1975. The result of this downgrade removed the city from the debt market and forced a massive reorganization of the city's finances. The Municipal Assistance Corporation and the Emergency Financial Control

Board were given extraordinary power to remedy this fiscal disaster.

BOND RATING BY AGENCY

S&P uses a 10-symbol system that ranges from AAA, the highest investment quality, to D, the lowest credit rating. S&P considers bonds in the top four grades (AAA, AA, A, and BBB) to be of investment-grade quality. In categories ranging from AA to BB, a plus (+) or minus (−) sign is used to designate relative standing within the rating categories. In general, S&P tends to consider the issuer's economic environment as the most important element in its analysis. It also makes more of a distinction between state and local GO bonds due to certain legal powers the state has that municipalities do not have. S&P seems to view state GO bonds as significantly stronger than those of lower level jurisdictions.

Moody's uses a nine-symbol system that ranges from Aaa, the highest investment quality, to C, the lowest credit rating. Moody's considers bonds in the top four grades (Aaa, Aa, A, and Baa) to be investment-grade quality. Moody's rating focuses on the debt burden and budgetary operations of the issuer. In contrast to S&P, Moody's essentially believes that state and local bonds are not fundamentally different. It applies the same debt and budget concerns to state GO bonds as it does to municipalities.

Fitch uses a rating system from AAA to D. A plus (+) or minus (−) sign is used with each rating except the AAA category.

BOND GRADES

Bond ratings for long-term investment grade bonds are given in Table 1. Those for long-term bonds of speculative grade are given in Table 2.

Table 1 Bond ratings for long-term bonds of investment grade

Rating	Explanation
Moody's Aaa, S&P's AAA, and Fitch AAA	These ratings are the highest grade a bond can be assigned; triple-A bonds have a relatively small degree of risk because payment is secured by a stable revenue source
Moody's Aa, S&P's AA, and Fitch AA	These ratings are similar to that of triple A, but differ only in that the revenue sources for double-A rated bonds are slightly less secure than the revenue sources of triple-A bonds
Moody's A, S&P's A, and Fitch A	Considered upper-medium grade, but revenue sources are relatively susceptible to fluctuations in relevant economic conditions
Moody's Baa, S&P's BBB, and Fitch BBB	Medium-grade obligations that are adequately protected and secured, but nonetheless may be unreliable if relevant economic conditions have long-run adverse effects on revenue source

[From Public Finance Department, Moody's Investor Service. *An Issuer's Guide to the Rating Process*; New York, NY, 1993 (information pamphlet); Standard and Poor's Corporation. *Municipal Finance Criteria*; New York, NY, 1994 (information pamphlet); Fitch Investor Service. *Fitch Ratings*; New York, NY, 1994 (information pamphlet).]

Table 2 Bond ratings for long-term bonds below investment grade

Rating	Explanation
Moody's Ba, S&P's BB, and Fitch BB	Lower-medium-grade obligations that are presently adequately protected and secured, but represent long-term risk whether relevant economic conditions are favorable or not
Moody's B, S&P's B, and Fitch B	These bonds are presently adequately protected and secured and represent risk regardless of economic conditions. In addition, it is likely that future relevant economic conditions will be unfavorable, thus intensifying the probability of default
Moody's Caa, S&P's CCC, and Fitch CCC	Besides future risks typical of bonds in the previous category, these are presently not adequately protected and secured, as present relevant economic conditions pose a threat to revenue source
Moody's Ca, S&P's CC, and Fitch CC	High degree of present and future risk; greater chance of default by issuer; debt issued in same conditions as those that produced CCC rating of a prior issue; given CC rating because of additional insecurity of being issued after CCC bonds
Moody's C, S&P's C, and Fitch C	For S&P's and Fitch, debt issued at same conditions as those that produced a CCC rating in a previous issue is given a C rating because of additional insecurity of being issued after CCC bonds; for Moody's, these are "the lowest rated class of bonds, and issues so rated can be regarded as having extremely poor prospects of ever attaining any real investment standing"
S&P's CI	Reserved for income bonds on which no interest is being paid
S&P's D and Fitch DDD, DD, and D	Assigned these ratings when payment is due and issuer defaults
S&P's and Fitch plus (+) or minus (-)	Indicate relative standing within the major categories from AA to CCC
Moody's "1"	Used to distinguish best bonds in each of five categories, Aa, A, Baa, Ba, and B

CONCLUSIONS

Bond ratings are a powerful tool that municipalities use to raise capital for day-to-day activities or specific projects that require long-term financing. Municipalities must be mindful of their bond rating when it comes to expenditures, since there is a direct inverse relationship between a bond rating and capital costs. A change in a municipal bond rating can be an important signal to concerned parties if it warns of information that was previously not available on the financial condition of a municipality. Bond rating agencies provide an important private sector "check" on the public sector to ensure that spending is closely monitored.

Bond Valuation

Richard L.B. LeCompte

*Department of Finance, Real Estate and Decision Sciences, Wichita State University,
Wichita, Kansas, U.S.A.*

INTRODUCTION

Bond valuation is the process of valuing long-term debt securities. Bonds are fixed-income financial claims issued to investors by corporations, governments, and government-sponsored enterprises. There are many different types of bonds with a vast array of features that vary widely. Bond types range from the “plain vanilla” described in most textbooks to exotic high-risk offerings, some that even have equity features and options embedded in them. The process of valuing each type of bond, however, has a similar starting point. The starting point in valuing bonds, as it is with other financial securities and investment projects, is a discounted cash flow (DCF) analysis. This approach takes forecasted cash flows occurring over the life of the instrument and discounts these projected values to account for the risk inherent in owning these instruments and the time value of money. Other factors may play a significant role in the pricing, but the key elements in bond valuation are the estimation of the cash flows and determining the appropriate discount rate to be used in calculating the present value or price of the bond in question.

BOND DEFINITION

A bond is a long-term contractual debt obligation that is issued by a corporation or governmental entity. In return for the purchase price, the bond’s present value, the bond issuer promises to pay the investor a specific series of payments on designated dates in the future. These provisions classify bonds as fixed-income securities. A note, which is a financial claim similar to a bond, differs in that it has shorter original maturity than a bond, less than 10 years, whereas a typical bond has an original term to maturity of 10 years or greater. Typical bonds have 20- and 30-year maturities. The most basic type of bond is a fairly simple debt instrument that provides the bondholder the promise of: 1) a series of equal semiannual coupon payments, an annuity, over the life of the bond; and 2) a much larger lump-sum payment on the bond’s maturity date. This final payment is the par value of the bond. It may also be referred to as the bond’s face or maturity value and

is analogous to the principal value of a loan. For standard bonds, par value is typically \$1000 and the annual coupon payment is a fixed percentage of that value, but the coupon payments are usually made on a semi-annual basis. Bonds are normally quoted on a “per 100” basis, where a bond value quoted as 96 3/4 sells for \$96.75 per \$100 of par value, meaning that the bond with the typical par value of \$1000 sells for \$967.50. Bonds are generally sold “with interest.” This means that the purchaser must pay the seller the quoted price plus the proportion of the next coupon interest payment that has accrued on the bond since its last coupon payment.

FEATURES OF A BOND AND ITS INDENTURE

The promises or contractual obligations of a corporate bond issuer and rights of investor are set forth in great detail in what is known as an indenture. The indenture normally specifies a trustee, whose function is to represent the rights of the bondholders. The trustee is also a party to the contract and is responsible for enforcing the contracts within the indenture. Specific covenants in the indenture detail features of the bond such as the coupon rate, security or collateral provided by the issuer, maturity date, call and sinking fund provisions, and equity features such as conversion rights or warrants that may be attached to the issue. The indenture also contains covenants to protect the investor’s rights relative to the issuer. Typical protective covenants include subordination clauses, dividend restrictions, and limitations on the values for financial ratios such as a firm’s current ratio or its debt ratio. Protective covenants may also be used to protect the bondholder in the event of the firm’s merger or a significant change in organizational structure or control, and provisions may also set limitations on the sale or disposition of assets. Violating the terms of an indenture is classified as a default that requires the trustee to undertake certain specified actions in order to protect the rights of the bondholder. Default also occurs when the issuer of the bond fails to fully pay either principal or interest when due. Bondholders’ financial claims have priority rights over preferred and common

shareholders with respect to the income and assets of the corporation. This makes bonds less risky investments compared to preferred and common shares, which are paid only after bondholder claims are satisfied.

VALUATION OF BONDS

To value a bond or any other financial asset, one must compute the present value of all remaining cash flows using a DCF analysis. In the case of a bond, the cash inflows consist of the scheduled coupon payments and the return of principal at maturity. In addition to these payments, contractual features contained in the bond's indenture may also influence the value of cash flows and when they are received. Using DCF analysis, the value of a bond is the present value of the coupon payments plus the present value of the par value of the bond discounted at the appropriate rate of interest. This interest rate is the bond's yield to maturity (YTM), and it is the discount rate that equates the present value of the cash inflows with the current price or value of the bond. The YTM used in bond valuation is analogous to the internal rate of return (IRR) utilized in the evaluation of the return on real capital projects.

Determining the value of a bond is similar to valuing any project or investment using DCF analysis. First, the cash flows are estimated, and then one must determine the appropriate discount rate to use in calculating the present value of the expected future cash flows. Even though a bond's coupon payments and principal repayment are specified, there is a probability of default, and this impacts the discount rate utilized by the investor. The discount rate is the investor's required rate of return and is a risk-adjusted rate in accordance with the risk of the bond, the investor's opportunity cost, and the investor's level of risk aversion. Most bond valuations typically utilize only one rate to discount all cash flows throughout the life of the bond, and it is assumed that this rate remains constant throughout. This assumption can be relaxed to produce a bond valuation framework where different required rates of return are used for different time periods. The discount rate used for any bond can also be viewed as the real required rate of return plus various risk premiums for items such as the expected rate of inflation, default risk, liquidity or lack of it, tax characteristics, callability, sovereign risk, industry risk, foreign exchange risk, etc.

The value of a bond is equal to the present value of an annuity (the coupon payments) plus the present value of a single final payment at maturity (the

par value). In general, the price of the bond can be computed using the following formula:

$$\text{Price} = \sum_{t=1}^N \frac{C_t}{(1+r)^t} + \frac{M}{(1+r)^N}$$

where N is the number of periods until maturity, t is the time of the periodic payment, C is the annual coupon payment in dollars, r is the required rate of return or YTM, and M is the par or maturity value.

Since most bonds pay coupon payments semiannually, the above equation becomes

$$\text{Price} = \sum_{t=1}^{2N} \frac{C_t/2}{(1+r/2)^t} + \frac{M}{(1+r/2)^{2N}}$$

For example, assume that a \$1000 par value bond pays a stated 10% annual coupon rate, resulting in an annual coupon of \$100. The bond's maturity date is five years from today. Dividing the annual payment by two leaves the investor with a \$50 semiannual coupon payment for 10 semiannual periods. Assume that the bond has a YTM of 8%, indicating a 4% semiannual rate, using the following equation; the value of the bond would be \$1081.11:

$$\begin{aligned} P &= \frac{50}{(1.04)^1} + \frac{50}{(1.04)^2} + \frac{50}{(1.04)^3} + \frac{50}{(1.04)^4} \\ &\quad + \cdots + \frac{50}{(1.04)^{10}} + \frac{1000}{(1.04)^{10}} \\ &= \$1081.11 \end{aligned}$$

where \$50 is the semiannual coupon payment in dollars, 4% is the semiannual interest rate, \$1000 is the par value, 10 is the maturity in semiannual periods, and 8% is the YTM, *annual rate*.

As can be seen in this example, the bond above sells for more than its par value, or the bond is selling at a *premium* to par. When the discount rate used is less (greater) than the coupon rate paid on the bond, then the bond sells for a price that is greater (less) than the par value. Bonds selling below their par value are called *discount* bonds.

There are also discount bonds called zero-coupon bonds. For a zero-coupon bond, there are no periodic coupon payments, thus the name zero-coupon bond or zero. Zeroes have only one payment, the par value of the bond repaid at maturity. To value a zero-coupon bond, one can use the valuation equation above and simplify it by dropping the first term and using the remainder. That is, the present value or price of a zero-coupon (single payment) bond is

just the present value of the payment that occurs at maturity:

$$\text{Price} = \frac{M}{(1 + r)^N}$$

where N is the number of periods until maturity, r is the required rate of return or YTM, and M is the par value.

The following valuation of a zero-coupon bond is based upon the cash flows previously discussed in regarding to the coupon-paying bond. In this case, the par value is \$1000. There are no coupon payments and there are 10 semiannual periods until maturity, with a semiannual discount rate of 4%:

$$P = \frac{\$1000}{(1.04)^{10}} = \$675.56$$

In the coupon-paying bond example, this is just the value of the last term in the equation.

Some zero-coupon bond are issued by the U.S. government and are known by their acronym STRIPS. This is short for Separate Trading of Registered Interest and Principal of Securities. These zero-coupon bonds are created by the stripping of U.S. government bonds and notes into separate securities for each of the individual coupon payments and the principal payment for sale to the public. Treasury bonds and notes with original maturities that are greater than 10 years are eligible for the STRIPS program, and these securities are direct obligations of the U.S. government. The creation of these securities clearly shows how a coupon-paying U.S. government bond can be viewed and valued as a portfolio of zero-coupon bonds (STRIPS). Other types of zero-coupon instruments include

U.S. government issued treasury bills (short-term debt obligations) and zero-coupon bonds issued by some corporations.

FUNDAMENTAL BOND VALUATION RELATIONSHIPS

There are several fundamental relationships that are important to understand regarding the valuation of bonds. Since the cash flows for a bond are fixed at the time of issue, any change in the required rate of interest requires that the price of a bond move in the opposite direction to the change in the interest rate associated with the security. Fig. 1 shows the relationship between the price of a bond and its YTM. The bond used in the diagram is a bond with an 8% YTM, \$1000 par value with a 40-year maturity, and an 8% annual coupon interest payment.

As can be seen in Fig. 1, at an 8% YTM, the bond's price is equal to its par value, \$1000. As the YTM rises, the price falls. Conversely, as the YTM on the bond falls, its price rises. The price-yield relationship illustrated in the diagram is specific to the bond in question. Different bonds with different characteristics have graphic profiles that differ from this 8% coupon, 40-year maturity bond. Longer-term bonds have a steeper slope in that they are more price sensitive than shorter bonds. For bonds alike in all respects except time to maturity, a given change in the market rate of interest causes the price of the longer maturity bond to change more in percentage terms than the price of the shorter maturity bond. Low coupon bonds also create a graphic profile with a steeper slope in that they are more price sensitive than high coupon bonds. That is, for bonds alike in all respects except coupon size, a

Fig. 1 Bond valuation—8% annual coupon rate, 40-year maturity. The inverse relationship between price and yield to maturity on a bond.

given change in the market rate of interest causes the price of the lower coupon bond to change more in percentage terms than the price of the higher coupon bond. The price risk of a bond is characterized by the changes in the bond's value for a given change in interest rates and is shown graphically by comparing a bond's price with the range of possible YTM's, as is done in Fig. 1. The two prime factors determining price risk for fixed-income securities are the coupon and maturity effects described above. The bond's price risk can also be measured by its duration, which in a single metric accounts for both of these effects.

Other factors that have an impact on the value of a bond are such issues as its marketability and liquidity in secondary markets, tax treatment, embedded options, credit risk, and features such as callability and convertibility. A call feature on a bond allows the issuer to retire the bond prior to its maturity. The call option is generally beneficial to the issuer and detrimental to the investor and, therefore, results in a lower bond price than that of a non-callable bond, *ceteris paribus*. In the indenture of a bond, the call provision specifies a price at which the bond could be called. This is typically the par value plus a call premium. The investor is generally protected from a call for a certain specified period, and the value of the call premium generally declines as the bond gets closer to its maturity. Conversion provisions are significant features for some bonds. The conversion option may enhance the bond's value in that it allows the bondholder, under certain conditions, to convert the bond into shares of the firm's common stock. Municipal bonds are also valued using the DCF methodology. The tax exemption provided for municipal bond interest payments enhances the value of the cash flows from these bonds, especially to those individuals in the highest marginal income tax brackets. The impact of the tax exemption reduces the required rate of return on municipal bonds relative to bonds with taxable interest payments, *ceteris paribus*. Another significant factor in the valuation of bonds is the credit rating assigned by various rating

agencies. These credit ratings exhibit their impact in the size of the default risk premium, which investors require to be added to the discount rate they apply to risky bonds.

CONCLUSIONS

This article has provided a presentation of the DCF methodology utilized to value bonds. Specifically, the value of a bond is equal to the present value of its expected cash flows, which have been discounted using an appropriate risk-adjusted discount rate based upon the bond's characteristics, investor preferences, and time value of money. Specific examples have been provided for valuing a "plain vanilla" coupon-paying bond and the valuation of a zero-coupon bond. In addition to the DCF approach to valuation, it is recognized that other factors and features included in the bond's indenture may alter value. Various pricing relationships for bonds have also been discussed in the context of the risk created by various characteristics of a specific bond. Also, the similarity between valuing bonds and the valuation of other assets has been discussed. Further information regarding bond valuation is available in the references provided.

INTRODUCTION

Once funds have been appropriated for spending in the sequence of budget formulation, negotiation, and enactment, budgets then must be executed as planned and authorized.^[1] However, budgets also must be responsive to changing circumstances during the period of spending execution. All organizational entities employ management control systems with imbedded incentives, sanctions, and a myriad of rules to control spending and the budget execution process. Agreed upon authority relationships, institutional roles and responsibilities, job performance criteria, rules and regulations, incentives and motivational structures, and intra-organizational arrangements comprise the management control systems to provide accountability in an effort to stimulate decision making that results in efficient and effective use of funds.^[2] Various levers of management control are used in the private sector to achieve organizational objectives.^[3] In the public sector, these levers of control are employed by elected officials and, more typically as a result of delegation, by budget control agents and agency managers in budget execution. Control systems and controls have important consequences for how managers behave—this is the explicit purpose of these systems and levers. In budget execution, rules may be designed to tightly control what money is spent on before it is spent (ex ante controls). Alternatively, controls may be applied after the fact, focused on measuring, rewarding, and sanctioning the results of managerial action after spending has occurred (ex post controls). Correctly designed control systems help to stimulate efficient use of resources and development and use of appropriate reporting systems. Conversely, inappropriate control systems and controls tend to create budget execution procedures and processes that are simultaneously over-controlled and out of control. Where budget execution controls are inappropriate for what

is demanded of them and do not report correct information in a timely manner, they will fail to stimulate efficient spending decisions and management behavior and, paradoxically, may create or exacerbate waste, fraud, and other forms of funding misuse.

DESIGNING THE SYSTEM

Critical choices must be made in designing the appropriate budget execution management control system. The successful design should fit the objectives of control and the nature of the entity to be controlled. For example, increasing costs and homogeneous outputs imply one kind of design, while decreasing costs and heterogeneous outputs imply another. The purpose of the analysis of budget execution and management control provided here is to improve understanding of control dynamics, incentives, disincentives, and the behavior of the various participants in the budget execution and management control process. Our analysis focuses most closely in this regard on the roles of central executive branch budget agency controllers, agency budget officials, and program managers.

The other purpose served by this analysis is to ask whether there is cause to change budget execution and management control processes, as they now operate in many, if not most, public-sector organizations. If so, what direction should change take? The analysis delineates alternative types of control applied in executing budgets and the rationale for employing these different methods. A distinction is drawn between budget execution control intended to influence the behavior and performance of managers of government programs from controls applied to affect independent private-sector firms that contract to deliver goods or services to the public on behalf of government. The central theme of this analysis is that budget execution and management control system design should fit the

objectives of control and the nature of the entity to be controlled.^[4]

Perhaps the most challenging task in budgeting is to execute well, so that the best program outcomes are achieved with some degree of efficiency and a genuine concern for the proper use of public funds. Budget execution skill is required to respond to inevitable contingencies that arise to complicate the implementation of programs in the manner planned and according to the commitments made in budget formulation. Accountability and management control must be maintained, and employees must be motivated to perform to high standards. At the same time, uncertainty must be accommodated, as budgets are executed to meet the demands of the real world—demands that often cannot be anticipated and budgeted accurately in advance. While the highly visible politics of budget formulation and enactment garner the attention of the media and of budget negotiators and critics, it is only in the phase of budget execution that performance, outputs, and outcomes are obtained. In our assessment of budgeting, we must not lose sight of the fact that it is consumption (use) of assets in attempt to achieve the objectives of organizations and governments that matters most if our goal is to learn to spend and manage better.

BUDGET EXECUTION AND MANAGEMENT CONTROL ISSUES

Budget execution typically is highly regulated to control what program managers may and may not do. Controllers are driven by the objective of insuring that budget appropriations in total and by legally segregated account are not overspent by programs.^[4] However, controllers also must be concerned with underexecution. Department and agency budget officers and program managers do not want to under-spend and thereby lose claim to resources in the following year. Central executive budget office controllers do not want programs to execute without good cause, so that money not used in the manner justified in budget formulation may be withdrawn from program managers. Executive controllers want to be able to withdraw funds from programs to protect the integrity of the appropriation process and to reallocate money to areas where it will be spent efficiently in response to client demand. For these reasons, budget execution typically is monitored and controlled carefully by agency budget staff and central executive budget controllers. Often, execution is also monitored closely by legislative oversight committees and their staffs out of a desire to insure that legislative will is implemented faithfully, and to make sure that benefits are distributed to the clients targeted in the appropriation process.^[4] Because the electoral fortunes of

legislators are tied to some degree to the public perception that they are solving the problems and meeting the demands of their constituents, legislators have considerable interest in budget execution control.

BUDGET EXECUTION TECHNIQUES

Among the techniques used to control budget execution, variance analysis is probably the most familiar. Controllers and budget officials in government program offices monitor the differences between projected and actual revenues and expenses in total and by account. They monitor revenue and expense rates against allotment controls by quarter, month, week, and day—temporal control generally is required by the allotment process. Other variables monitored are purpose of expense relative to budget proposal and appropriation rationale, and location of revenues and expenses by unit and, at times, by geographical location. Monitoring of actual revenue and expense rates as well as program output and demand, where measurable, is done to compare current spending to proposals made in the budget for the next year that is under negotiation at the same time as the fiscal year budget is expended. Comparisons are made to historical revenue and spending trends, in some instances, to better understand how current programs are performing. Budget execution monitoring and control are particularly important toward the end of the fiscal year for reasons stated above, to avoid over- and underexpenditure relative to appropriation.

BUDGET EXECUTION MANAGEMENT CONTROL CHOICES

Research in public finance has paid considerable attention to budget formulation but has tended to ignore budget execution.^[5–7] The reasons for this oversight are understandable. Government budgets are formulated in public, and the issues debated during this stage of the public spending process are dramatic and crucial. On the other hand, budgets are executed in private, and the issues raised in their execution are often mundane. Because of this selective attention, observers and participants in the public spending process understand program analysis far better than controllership. Consequently, the conduct of program analysis has come to be guided by a fairly coherent set of professional standards. There is agreement on what is good analysis and what is good accounting practice. Although the design and operation of control systems can profoundly influence governmental performance, budget execution controllership is not guided by a coherent set of professional standards.

Without appropriate performance standards, budget officers cannot be held accountable for performance of this function. Consequently, control systems are not designed to optimize the quality, quantity, and price of goods and services purchased with public money, but “to facilitate the controller’s [other] work.”^[4]

EX ANTE AND EX POST CONTROLS DEFINED

The choice of whom to subject to controls and when to execute those controls is not easy. The control system designer has at least four options. First, the subject may be an organization or an individual. Second, controls may be executed before or after the subject acts. The former may be identified as *ex ante* and the latter as *ex post* controls.^[8] *Ex ante* controls are intended to prevent subjects from doing wrong things or to compel them to perform well. Necessarily, they take the form of authoritative commands or rules that specify what the subject must do, may do, and must not do. Subjects are held responsible for complying with these commands, and the controller attempts to monitor and enforce compliance. In contrast, *ex post* controls are executed after the subject decides on and carries out a course of action and after some of the consequences of the subject’s decisions are known. Because bad decisions cannot be undone after they are carried out, *ex post* controls are intended to motivate subjects to make good decisions. Subjects are held responsible for the consequences of decisions, and the controller attempts to monitor consequences and rewards or sanctions accordingly. The control system designer may choose between four distinct design alternatives: individual responsibility, *ex ante* or *ex post*, and organizational responsibility, *ex ante* or *ex post*.

PURPOSES OF EX POST CONTROLS

Ex post financial controls are used to reveal demand. They are executed after operating decisions have been made, after asset acquisition and use decisions have been carried out, and after output levels have been monitored. Their subject may be a free-standing organization, such as a private contractor or a quasi-independent public entity, or an individual manager subordinate to the controller, such as a responsibility center or program manager within a government agency.

In a free-standing organization, the structure of authority and responsibility within the organization is assumed to be an internal matter. The controller establishes a price schedule and specifies minimum service quality standards or a process whereby these

standards are to be determined. This price or cost schedule may entail all sorts of complex arrangements, including rate, volume and mix adjustments, and default penalties. Where one organization can optimally supply the entire market, the controller may grant it a monopoly franchise, for example, in garbage collection for a small town or neighborhood. The significant characteristic of this approach is that a unit price cost schedule remains in effect for a specified time period.^[9–11] This means that the government’s financial liability will depend on the quantity of service provided and not on the costs incurred by the organizations supplying the service.

Where this budget control system design is employed, for example, where a municipality purchases gasoline at the spot-market price or where states commit to pay free-standing organizations such as a university a fixed price for performing a specific service such as enrolling students or treating heart attacks, or where the Air Force buys F-16s for a fixed price, the controller must rely upon interorganizational competition to provide sufficient incentives to service suppliers to produce efficiently and make wise asset acquisition and use decisions. If interorganizational competition is effective, those organizations that do not produce cost-effectively will not survive.

However, even where the declining marginal cost of the service in question makes monopoly appropriate, *ex post* controls can still be employed. This is done in businesses and business-like public-sector enterprise organizations by holding managers responsible for optimizing a single criterion value, subject to a set of constraints.^[4] A prevalent approach through which this control system design is employed at the federal level is the revolving fund.^[12,13] In this circumstance, the controller gives the manager the authority to make spending decisions and to manage cash flow for an extended period of time, e.g., for one year or more. For example, the manager is given the authority to make spending decisions to acquire and use people and assets, subject to output quality and quantity constraints determined by customers, and is held responsible for supplying agreed upon outputs while minimizing costs.

THE LOGIC OF EX POST CONTROL

Large private-sector firms produce comprehensive operating reports describing the performance of responsibility centers and programs, but their budgets seldom are detailed. The logic of *ex post* control is that the purpose of the budget is to establish performance targets that are high enough to elicit from the organization’s managers their best efforts. Such budgets might

contain only a single number for each responsibility center—an output quota, a unit-cost standard, a profit, or a return-on-investment target.

Under this approach to budget control, the structure of authority and responsibility within the organization is of interest to the financial controller. The effectiveness of this design depends on the elaboration of well-defined objectives, accurate and timely reporting of performance in terms of objectives, and careful matching of spending authority and responsibility. Its effectiveness also depends upon the clarity with which individual reward schedules are communicated to responsibility center managers and the degree of competition between alternative management teams. Finally, under this approach, the financial liability of government depends on the costs incurred in providing the service and not merely on the quantity or quality of the service provided.

PURPOSES OF EX ANTE CONTROLS

In contrast to ex post budget controls, ex ante controls are demand concealing. Their distinguishing attribute is that the controller retains the authority to make or exercise prior review of spending decisions. Ex ante financial controls are executed before public money is obligated or spent, and they govern the service supplier's acquisition and use of assets. Examples of ex ante financial controls include object-of-expenditure appropriations, apportionments, targets, position controls, and fund and account controls that regulate spending by account and the kind of assets that can be acquired by governmental departments and agencies. Such controls also govern the behavior of private contracting entities that supply services to government or to clients on behalf of governments.

Execution of ex ante controls requires assessment of the consequences of asset acquisition decisions. This consideration may be implicit, as it is in the execution of the traditional line-item budget and basic-research contracts, or explicit, as in the execution of performance and program budgets and systems development contracts. It is often influenced by information on current and past performance, but consideration of the consequences of spending decisions is always prospective in nature.

The logic of ex ante control is that constraining managerial discretion is the first purpose of budget execution. Because the degree of constraint will depend upon the detail of the spending plan, as well as the degree of compliance enforced by the controllers, these budgets need to be highly detailed. A department or agency budget must identify all asset acquisitions to be executed during the fiscal year and make it clear who is responsible for implementation.

Under ex ante budget control, service-supplying organizations must be guaranteed an allotment of funds in return for continuously providing a service for a specified period. The service provider will assume some responsibility for managing output levels or delivery schedules, service quality, or price to the government customer. Government is directly responsible for all legitimate costs incurred in the delivery of services, regardless of the actual quantity or quality of the services provided.

ENFORCING EFFICIENCY WITH EX ANTE CONTROLS

Where a manager seeking to increase a budget is subject to tight ex ante controls, the controller can enforce efficiency during the budget period by requiring affirmative answers to the following questions:

1. Will a proposed change permit the same activity to be carried out at a lower cost?
2. Will higher priority activities be carried out at the same cost?
3. Will proposed asset acquisitions or reallocations of savings support activities that have a higher priority than those presently carried out?

When operating managers are faced with these criteria, they respond appropriately. Controllers approve most changes in spending plans proposed by operating managers because only mutually advantageous changes will be proposed in most circumstances.

WHEN TO DELEGATE EX ANTE CONTROLS

When line-item or lump-sum appropriations have a comparative advantage, to say that ex ante controls are a necessary means of reinforcing the controllers' bargaining power should not imply that tight ex ante controls always must be administered by them. Under certain conditions, authority to spend money, transfer funds, fill positions, etc., may be delegated to subordinate managers. The threat of reimposition of ex ante controls will be sufficient to insure that the manager's behavior corresponds to the controllers' and elected officials' preferences. In order for such delegation to take place, the following conditions must be present:

1. Reimposition of controls must be a credible threat.
2. The gain to the manager from delegation must more than offset the associated sacrifice in bargaining power; the manager of an agency in the stable backwaters of public policy has little to

gain from relief from ex ante controls if the price of such relief is a change in business as usual.

3. Controllers must be confident that their monitoring procedures, including postaudit, will identify violations of “trust.”

Clearly, all long-term relationships with private contractors and government goods and service suppliers rely to some degree on ex ante controls. Even the operation of fixed-price contracts requires prior specification of product quality standards and delivery schedules. But, flexible-price, cost-plus type contracts and appropriated budgets require considerably higher levels of reliance on ex ante controls and also on monitoring and enforcing compliance. And, the cost of tightly held budget execution control is high.

ACCURATE RECORDS AND EFFICIENCY

At the least, adoption of the budget execution control systems described herein means that controllers must take steps to ensure that suppliers fairly and accurately recognize, record, and report their expenses. This, in turn, requires careful definition of costs and specification of appropriate account structures, accounting practices and internal controls, direct costing procedures, and the criteria to be used in allocating overheads. Still, accurate accounting does not guarantee efficiency. Even where the service supplier's financial and operational accounts completely and accurately present every relevant fact about the decisions made by its managers, they will not provide a basis for evaluating the soundness of those decisions. This is because cost accounts can show only what happened, not what might have happened. They do not show the range of asset acquisition choices and trade-offs the supplier considered, let alone those that should have been considered but were not.

APPROPRIATE DESIGN OF BUDGET CONTROL SYSTEMS

Under line-item or lump-sum budgets and flexible-price contracts, asset acquisition decisions must be made by the contractor, but the contractor cannot be trusted completely to make them efficiently. Consequently, the contractor must be denied some discretion to make managerial decisions. The fundamental question is, how much must be denied? To what extent should government officials or their controller agents regulate, duplicate, or replace the contractor's managerial efforts?

This question must be addressed, because oversight is costly in terms of monitoring and reporting costs,

and also because of the benefits sacrificed due to failure to exploit the contractor's managerial expertise. The controller and the government official will seldom be more competent to make asset acquisition decisions than the contractor. The answer to this dilemma is that controllers and officials should do the minimum necessary, given the incentives faced by and the motivations of the contractor. Still, at times, the minimum necessary is a great deal. This decision depends on circumstance and the controller's skill in exploiting the opportunities created by the contractor's response to institutional constraints. In other words, all long-term relationships between government officials and contractors must rely on incentives, even those governed by lump-sum budgets and flexible-price contracts. The difference is that when these control system designs are employed, the incentives are deeply embedded in the process of budget and contract execution.

Budget execution management control should be matched to circumstances: increasing costs and homogeneous outputs imply one kind of design, while decreasing costs and heterogeneous outputs imply another. However, what we observe in practice is that this match is not always achieved. Controllers tend to rely on monopoly supply and ex ante controls.^[14–17] This combination cannot be appropriate for every service to which it is applied. Evidence can be marshaled to show that a variety of services might be performed satisfactorily by competing organizations, including in air traffic controls,^[18] custodial services and building maintenance,^[19,20] day-care centers,^[19] electrical power generation,^[19] fire protection services,^[21,22] forest management,^[23] management of grazing lands,^[24] hospitals and health care services,^[25] housing,^[26] postal services,^[25] prisons and correctional facilities,^[25] property assessment,^[27] refuse collection,^[28,29] security services,^[25] ship and aircraft maintenance,^[19,30] urban transit,^[25] and wastewater treatment.^[25] Furthermore, even when controllers eschew monopoly supply, they frequently fail to fully exploit the benefits of competition. In New York City, for example, the municipal social services agency acquires child-care services for its clients from public and private day-care centers. Public centers are subject to the full panoply of ex ante controls associated with lump-sum appropriation budgets, and private centers are subject to those associated with flexible-price contracts.

DEPARTMENT OF DEFENSE PRACTICES

To cite another example, Department of Defense (DoD) policy often has restricted the use of flexible-price contracts to situations characterized by considerable procurement risk, e.g., in R&D projects. In other contracts, the degree of incentive is supposed to be

calibrated to project risk. The first ship in a multiship construction program is supposed to be constructed under a cost-plus-fixed-profit contract, while later editions are supposed to be built under fixed-price contracts, on the assumption that experience permits the contractor to manage to a narrower range of cost outcomes and to assume a greater share of the risk burden. It may be observed that while DoD generally makes the proper transition from cost-plus to award-fee contracts as it moves from design to prototype development, it may not make the transition to a fixed-price contract for downstream production.^[31] To be consistent with the logic advanced here, selection of defense system production suppliers should be reduced to a question of cost and price search. Acquisition should be based upon fixed-price contracts, awarded by competitive bidding. Where production volume is sufficient, DoD should try to maintain long-term contractual relations with two or more producers, as multisourcing permits price search at each negotiation of the relationship between DoD and its suppliers.^[32] Nevertheless, winning a contract to develop a weapons system continues to be tantamount to winning subsequent production contracts in a high proportion of cases. Finally, not only do controllers tend to subject government agencies and contractors to a wide array of ex ante controls, they often hold them to tight output, quality, and service delivery schedules. Performance targets that can be met all of the time are not very ambitious.

CAUSES OF BUDGET AND MANAGEMENT CONTROL MISMATCH

What accounts for mismatches between how budgets are controlled in practice and the approach advanced here, which relies on a more sophisticated set of controls dependent on analysis of cost structure (increasing or decreasing) and type of output (homogeneous or heterogeneous)? One explanation is ignorance of consequences on the part of the controllers and elected officials. Also, some of the empirical data required to employ the control criteria outlined here are often unavailable. The most critical gap in this knowledge is how costs vary with output. Definitions and measurements of service outputs and activities are often inadequate. Insufficient effort has been made to correct this situation in most public organizations. Of the two tasks, getting knowledge about the shape of cost functions is the more difficult. But if we first answer the question, “Cost to do what?,” this knowledge can be derived deductively in a manner similar to the methods used in cost accounting and conventional price theory. Cost and supply analysis can yield highly useful information about marginal and average costs. Finally, experimentation

with funding and output levels will increase our knowledge of service supply and cost functions.^[33–35]

The kind of information called for here requires a high level of analytical sophistication in budget execution and system design, a skill that staff responsible for executing budgets may lack. Indeed, even if controllers had good information on cost and service supply functions, some might not know how to use it. Their experience tends to orient them to the administration of the traditional line-item, object-of-expenditure budget. Effective administration of a lump-sum or line-item appropriation requires no more than a modicum of arithmetical ability combined with a substantial amount of horse sense and bargaining savvy. However, matching control systems design to circumstances requires a practical understanding of applied microeconomics and financial and managerial accounting. Controllers often fail to understand the ideas outlined here or how to implement alternatives to the line-item appropriations budget—where to exercise judgment and where to exercise specific decision rules. This is demonstrated by the persistent attempt of controllers to employ techniques devised for use within organizations, such as standard costs based on fully-distributed average historical costs, to establish per-unit prices for public organizations such as hospitals and universities.

OBSTACLES TO REFORM

Absence of knowledge of options and objectives is not a satisfactory explanation for controller decisions to resist reform. Such problems can be corrected, and incompetence may be weeded out. If a better match between control system design and circumstances would have a substantial payoff, why has this situation not been corrected? One answer regarding the implementation of reform is as follows.

A large part of the literature on budgeting in the United States is concerned with reform. The goals of the proposed reforms are couched in similar language—economy, efficiency, improvement, or just better budgeting. The President, the Congress and its committees, administrative agencies, even the citizenry are all to gain by some change. However, any effective change in budgetary relationships must necessarily alter the outcomes of the budgetary process. Otherwise, why bother? Far from being a neutral matter of “better budgeting,” proposed reforms inevitably contain important implications for the political system, that is, the “who gets what” of governmental decisions.^[36]

If controllers and elected officials empowered to determine the methods used in executing budgets are rational (we understand that politics often compromises rationality as we define it from a management

perspective), this quote implies that they have a strong interest in maintaining the status quo. To explain the persistent mismatch between budget execution control system designs and practice, it is necessary to determine who benefits from the status quo and, therefore, who will oppose the adoption of a more appropriate type of control.^[37] Members of Congress, state legislators, city council members, and any politician with a constituency worth cultivating would appear to lose as a result of reforms proposed. As the collective holders of the power of the purse, legislators clearly have the authority to order budgets to be executed in almost any way they like, including the power to delegate this authority to controllers. Efficiency implies an exclusive concern with the supply of goods and services to the citizenry, with some indifference as to the means used to supply the goods or even to the identity of the suppliers. However, legislators are frequently as concerned about where public money is spent and who gets it, as they are with what it buys.^[38–41] Line-item appropriations in general, and object-of-expenditure budgets in particular, are ideally suited to the satisfaction of legislative preferences with respect to how public money is spent, where it is spent, and who gets it.

Budget Reform

Jerry McCaffery

*Department of Systems Management, Naval Postgraduate School,
Monterey, California, U.S.A.*

INTRODUCTION

Budget reform involves restructuring the budget process to provide better information so that decision makers can make better resource allocation decisions. Reforms have focused on process improvements such as program budgeting, performance budgeting, and zero-based budgeting, and desired outcomes such as balanced budgets and mechanisms to produce them. After an examination of the meaning of budget reform and its historical context, this article discusses how the concepts of planning, management, and control form core elements of all budget systems, but are emphasized differently in different budget systems and reforms.

MEANING OF BUDGET REFORM

Budget reform has been hampered because government budgeting itself is not simple. In sending his proposal to create an executive budget system to Congress in 1912, President Taft said, “The Constitutional purpose of a budget is to make government responsive to public opinion and responsible for its acts” (Ref.^[1], p. 19). The proposal further noted that a budget served numerous purposes, from a document for Congressional action, to an instrument of control and management by the President, to a basis for the administration of departments and agencies. Since then, the multiple purposes for budgeting have been well recognized.^[2] As long as a multiform definition of budget is acceptable, defining budget is relatively easy. Considering budget reform is much more difficult. What is budget reform? Budget reform involves reshaping the budget and the budget process so that money is spent more efficiently, effectively, and wisely. Ultimately, budget reform might result in the more efficient application of public expenditures to public needs. In 1940, V.O. Key^[3,4] suggested that the critical question for budget decision makers was how to supply the answer to the fundamental question, “On what basis shall it be decided to allocate x dollars to activity A instead of activity B?” Key argued that this was fundamentally a political question, and how one answered that question was dependent on the one’s values.^[5] If the answer to Key’s question is no clearer

now than it was in the 1940s, it is also clear that budget practitioners before and after Key believed that improving the elements of the decision process was useful (For example, some researchers have found that budget type influences budget discussion, i.e. program budgets provoke more programmatic discussion. See Refs.^[6,7]).

EARLY AMERICAN PATTERNS: PREHISTORY

Budget reform has a rather extensive history. Early American budgetary patterns were both part of and separate from their predominantly English colonial heritage. They were part of that heritage in that the American colonies inherited English historical experience with gradual imposition of limits on the power of the monarch and the gradual expansion of legislative power. They were separate from this legacy in that the American revolutionaries carefully tried to avoid anything that smacked of giving power to an executive; having rid themselves of one king, they had no taste for another. In the turmoil during and after the American Revolution, two giants emerged on stage almost simultaneously. The reforms of William Pitt the Younger reshaped British budgetary practices (Wildavsky calls Pitt a pivotal figure in British budgetary history. See Ref.^[8]), while in the new United States Alexander Hamilton almost single-handedly created a budgetary system and practice for the new American nation.

As Chancellor of the English Exchequer from 1783 to 1801, Pitt faced a heavy debt load as a result of the American Revolution. Pitt consolidated a maze of customs and excise duties into one general fund from which all creditors would be paid, reduced fraud in revenue collection by introducing new auditing measures, and instituted double-entry book-keeping procedures. Moreover, Pitt established a sinking fund schedule for amortization of debt, requiring that all new loans made by government impose an additional 1% levy as a term of repayment. Pitt raised some taxes and lowered others to reduce the allure of smuggling. This model encompassed a royal executive with varying degrees of strength and a legislative body attempting to exert financial control over the Crown by requiring parliamentary approval of sources of revenue and expenditure. Approval was provided through

appropriations legislation and ultimately made administrative officials accountable to Parliament.

Hamilton's problems were different from Pitt's, but equally serious. After the Revolutionary War, the colonies departed from English tradition when they created fiscal systems that virtually excluded the executive, vesting power in various legislative arrangements. As a result of their distaste for central government, the powers of the first Congress established under the Articles of Confederation were weak. Their fear of creating a new monarch was evident in the manner in which powers were delegated to both the legislative and executive branches. The colonists were also averse to a system of national taxation. Taxation imposed a special hardship on the colonies because hard coinage was scarce and bills or letters of credit were used irregularly.

In 1789, as the first Secretary of Treasury, Alexander Hamilton strongly influenced development in this period (For an excellent biography of Hamilton, see Ref.^[9]). Initially, Hamilton set to establish the credit of the new government. His first two reports to Congress urged funding the national debt at full value, the assumption by the federal government of all debts incurred by the states during the Revolutionary War, and a system of taxation to pay for the debts.^a Strong opposition arose to these proposals, but Hamilton's position prevailed after he made a bargain with Thomas Jefferson, who delivered southern votes in return for Hamilton's support for locating the future nation's capital on the banks of the Potomac. Hamilton's third report to Congress proposed a national bank, modeled after the Bank of England. In a few short years, Hamilton submitted four major reports to Congress, gaining acceptance of three that funded the national debt at full value, established the nation's credit at home and abroad by creating a banking system and a stable currency, and developed a stable tax system based on excise taxes to fund steady recovery from the debt and to provide for future appropriations. Hamilton's role in establishing a system for debt management, securing the currency, and providing a stable revenue base make him the founding father of critical elements of the American budgeting system.

FIRST EFFORTS AT REFORM

As early as 1800, civilian agency budgets were presented in carefully detailed object-of-expenditure

form, whereas military expenditures tended to be appropriated as lump sums not unlike specific program categories. Early debate on budget development focused on enhancing flexibility and program accomplishments rather than on strict agency accountability in the arguments over the merits of lump sum versus line item appropriations, over the merits of allowing for executive discretion in spending money to execute programs as opposed to requiring that agencies follow explicit legislative directions constrained by line item appropriations. However, for most of the nineteenth century, government functions were few and simple, and were supported by equally simple budget structures and procedures. Tyler and Willand noted that by 1900, the United States was the "only great nation without a budget system" (Ref.^[10], quoting Ref.^[11]).

Debate about form and content of the federal budget accelerated as a result of local government reforms implemented in New York City and elsewhere from the mid-1870s through the beginning of the twentieth century, and culminated in Congressional enactment of the Budget and Accounting Act of 1921. The stimuli for passage of this act may be found in the deficits incurred in World War I and the various reform movements rising in local governments as a reaction to egregious examples of boss rule and political corruption in the late 1870s and after. It also had a national background. Irene Rubin^[12] suggested that some part of federal reform came from efforts to oversee the railroads at the end of the nineteenth century. Railroads were big and important to the public for carrying goods and passengers. With the expansion of railroads and the acquisition of one railroad by another, it was not always easy to tell if a railroad was making a profit or, indeed, if it were solvent. This meant it was also difficult to tell if the rates that were set for freight and passengers were fair. Thus, in the 1880s, the Interstate Commerce Commission was put in the position of regulating rates, but to do this it had to develop better accounting tools in consultation with the railroads. Once these procedures had been implemented for railroads—considered to be the largest, most complex, and most sophisticated of private corporations—government was then urged to make similar improvements for its own operations. Thus, reformers had rather clear ideas about what they were against and what they were for. Nevertheless, Rubin suggested that business leadership in budget reform has been overstated, and that it was government officials and academics who invented and modified public budgeting in the United States, while business methods have historically been given more credit than they deserve (Ref.^[12], p. 444).

In the 1900s, reform efforts were continued by Frederick Cleveland at the New York Bureau of

^aHamilton's program was outlined in four reports: Reports on the Public Credit of January 14, 1790 and December 13, 1790; The Report on a National Bank, December 14, 1790 and The Report on Manufactures, submitted to Congress on December 5, 1791.

Municipal Research and by President Taft's Commission on Economy and Efficiency in 1912. Long before the federal government passed the Budget and Accounting Act of 1921, many American cities had passed local budget reform acts that prevented city councils from appropriating money outside the confines of a budget. As early as 1899, the National Municipal League drafted a model municipal charter that incorporated a budget system under the direct supervision of the mayor (Ref.^[1], p. 13). Passage of the 1921 Act was an important point in the development of the executive budget power, giving the president the power to organize the executive budget process and to create a staff agency to compile, analyze, and make recommendations to Congress about agency budgets. The power of the executive over the budget process would grow steadily for the next 50 years as the functions of the federal government expanded under the impress of the Great Depression and Presidents Hoover and Roosevelt in the 1930s, World War II, and the social service revolution of the 1960s. These trends resulted in dramatic changes in the nature of the federal budget. From 1950 to 1990, federal government spending shifted from favoring discretionary expenditures with more than one-half of the annual budget spent on defense, to mandatory expenditures with more than one-half being spent on social security, health, and welfare programs. This made tools and processes related to discretionary expenditure less important than those aimed at analyzing, predicting, and controlling mandatory expenditures (see Refs.^[13],^[14] and ^[15]), and ensured that the search for better budget processes and tools would continue.

In the United States, twentieth-century budget reform spread from the local level to state and national levels. Although the influence of state and local reforms on national patterns has varied, state and local governments have remained a vital force for reform. Smaller and with a less complicated mechanism than the federal government, subnational governments faced less inertia and were more flexible in adopting reform elements and discarding them for something better. States and certain large cities must be seen as first adopters; the wise student of innovation will always find something of interest occurring there. Recently, states have been involved with target-based budgeting, performance budgeting, and performance measurement and accountability (see Refs.^[16-19]). Federal adoption of a particular state reform may be seen as mainstream acceptance of that reform; state adoption of a federal pattern often comes as an attempt to increase the synchronization between state and federal patterns in order for the state to extract more money from the federal budget.

Evaluation of the history of reform has been mixed. Irene Rubin argued that budget reforms are much

more widely adopted than is generally recognized. The benefits tend to be oversold and when exaggerated outcomes do not seem to appear, many participants lose interest and deem the reform a failure, regardless of whether it leaves real improvements in the budget process.^[20] Forrester and Adams cited the paucity of successful reforms and warned that budget reform requires attention to the organizational context, and that the objectives and execution of a reform must match the dynamic objectives and needs of the organization and be cognizant of the organizational culture.^[21] Notwithstanding that reform is neither linear nor certain, the last 100 years indicate reform efforts have a certain irrepressibility.

MODERN REFORMS OF PROCESS AND OUTCOME

Reforms have involved both process and outcome. Much of the history of budget reform involved finding ways to present budget information to decision makers in a more meaningful way so that better decisions can be made about how to allocate scarce resources. These reforms have included performance budgeting, program budgeting, zero-based budgeting, Planning-programming-budgeting (PPB) and various systems focused on target- or mission-based budgeting. Some reforms have focused on the budget process itself, in the belief that better staff or a more timely process would provide a better budget process. Paramount among these sorts of reforms are the Budget and Accounting Act of 1921, and the Congressional Budget Reform and Impoundment Act of 1974.

Dissatisfaction with budget outcomes, usually in respect to growing deficits, has resulted in a different type of budget reform basically attempting to mandate outcomes (e.g., deficit reduction or balanced budgets). Examples of this kind of budget reform at the federal level include in the Gramm-Rudman-Hollings (GRH) Acts of 1985 and 1987, and the Budget Enforcement Acts of 1990 and 1993, with their spending caps and pay-as-you-go requirements, and several attempts at a Constitutional Balanced Budget Amendment. These efforts were not without some adverse consequences. Attempts to meet the GRH targets often involved optimistic estimates of spending and revenues, and certain gimmicks such as shifted paydays, which probably did more to damage the budget process than reform it, especially because few if any of the GRH targets were met. With the Budget Enforcement Act of 1990, the United States shifted from a deficit control approach to a spending cap approach. This was a looser discipline, but it was used throughout the 1990s, being reenacted in the Balanced Budget Agreement of 1997 for the 5-year period out to 2002. For

discretionary accounts this meant tight discipline, often at or below a growth rate equal to that of inflation. Both Congress and the President seemed to move toward supplemental appropriations and emergency spending designations to escape some of this discipline.

In terms of process, the spending cap focus appeared to put more emphasis on the beginning of the budget process, and it is arguable that the 1990s saw the full fruition of the Congressional Budget Reform and Impoundment Control Act of 1974. The budget committees and the budget resolution became important forces in the budget process because they were used by both parties, but especially the Republicans, to seek new notions of the shape and size of the federal government. This new role was to be a diminished one, with power and programs being pushed toward more innovative and effective state and local governments, or even toward the private sector. New national security concerns occurring with the terrorist attacks of 2001 may lead to a reevaluation of this position. Providing for the common defense and responding to a great crisis has always been the role of the central government.

PLANNING, MANAGEMENT, AND CONTROL

In 1964, Allen Schick offered an analytic framework for budget reform that has withstood the test of time; its insights remain as penetrating and relevant now as they were then,^[22,23] and its explanations just as powerful. Schick said that every budget system comprised elements of planning, management, and control, and that different budget systems arranged and emphasized those elements differently. Planning involved the determination of objectives, the scrutiny of alternative courses of actions, and the selection of programs. Management involved programming of approved goals into specific goals and activities, designing programs to carry out those activities and providing staffing and resources to carry out those designs. Control involved the process of “binding” operating officials to the policies and plans set by their superiors, through the appropriation and budget execution process, and through budget control procedures such as position controls, limits on staffing, and transfer authority, purchase requisition, procurement, and travel procedures, capital outlay procedures, and pre- and postaudit processes.

Schick observed that planning, management, and control were not equally emphasized in budget systems because time was a scarce commodity in the budget process and participants had to choose which of these elements to maximize. In addition, Schick concluded that different budget systems inherently emphasize one of these elements over another. Consequently, the observer can examine different budget systems

for different characteristics, but these characteristics cluster around concepts of control, management, and planning. For example, control-oriented budget systems focus on line item budget systems, value the skills of accountants, focus on inputs (e.g., dollars, personnel), and are focused most heavily on budget execution. In contrast, management-oriented budget systems focus on the preparation stage of budgeting, are dominated by managers rather than accountants, focus on the units of work to be done (e.g., cases to be cleared, miles of highway to be built), and seek efficiency and effectiveness, rather than legally correct expenditure patterns. Budget systems that focus on planning were the most broad-gauge and focus on the prepreparation stage of budgeting (e.g., What is good policy? What should government do to bring about good policy?), emphasize benefit–cost analysis and the skills of economists and systems analysis, rather than managers or accountants, to work out streams of future benefits and costs. A planning-focused system in its insistence on supporting policy with dollars was the most generalized and difficult system to operate in Schick’s paradigm.

As a practical matter, Schick was concerned with explaining the differences between the early version of the PPB system then in use in the Department of Defense and the powerful analysis of non-defense spending offered by Aaron Wildavsky under the rubric of incrementalism, where the future is controlled by the past and departs modestly from it as budgets change by increments from year to year. Under PPB, Schick suggested that change would occur from the top down, rather from the bottom up. PPB systems would implement change as a result of comprehensive policy-making procedures, rather than an aggregation of individual decisions made year by year. PPB would be rational. Incrementalism would be experiential, and rely heavily on feedback and course correction procedures as a counterbalance to the lack of rationality and foresight. Although incremental budgeting would result in information and budgets building up from the bottom, PPB systems would result in a downward flow of budget decisions resulting from choices about policy.

After a brief governmentwide trial in the 1960s PPB was again limited to defense, not because defense is well suited to certain analytical skills or benefit–cost analysis logic, but because the existence of a threat drives everything. In defense, the critical budgetary questions each year are “what is the threat?”, “how has it changed from last year?”, and “what will we need to meet this threat 5 years from now.” PPB allows for these questions to be answered centrally in a unifying scenario and for subsequent decisions to flow down through the organization in response to that scenario. In most years, the defense budget is an

incremental system, in the same sense that federal non-defense budgets are incremental. However, occasionally, the threat situation changes dramatically. When that happens, the planning and budgeting system must reflect those changes. After the fall of the Berlin Wall and the collapse of the USSR, the threat situation for the United States changed dramatically. It was obvious that U.S. defense spending could now be lower, but efforts to articulate a new threat situation and a response to it took almost a decade and were not really resolved by the time of the terrorist attack in September 2001, although the defense establishment was downsized by about one-third during that period. Nonetheless, PPB remains alive and well in the Department of Defense because the defense budget must attempt to ascertain long-term threats, as well as to perfect the mix of current and future assets that will meet that threat. PPB is especially well suited to plan to meet threats to the United States by designing force structure (e.g., number of troops, tanks) and managing a stream of resources to fund each year what is necessary to meet the threat this year and in the future. In most years, PPB outcomes appear and may be incremental, reflecting an incremental change in the threat situation. No reason exists why PPB could not be used in the health or aging areas, except that it is an expensive system to use and it does tend to surface the total cost of packages that political decision makers would perhaps prefer to ignore until they need to be resolved in a climate of emergency.

Philip Joyce suggested that an understanding of the history of budget reform can be organized around Schick's concepts; thus, he divides U.S. budget history into four periods.^[24,25] The early period (1873–1937) is characterized by weak executive power, little central control, and idiosyncratic processes. Reformers sought to emphasize central control and to bring sound business practices to government, while focusing on increasing economy and efficiency. Joyce asserted that perhaps the single greatest outcome of this period was the Budget and Accounting Act of 1921, with its creation of the Bureau of the Budget and the establishment of the General Accounting Office to audit the results of federal spending and report to Congress. Joyce suggested the second period lasted from 1937 to 1960; this period emphasized management, thanks to the various challenges faced by the federal government with the Great Depression of the 1930s and World War II and its aftermath. Early efforts at performance budgeting were a key element of this period.

Joyce suggested that 1960 to 1985 was the third period of budget reform. Here, the emphasis was on planning for outcomes with program budgeting and PPB systems. During this period, reforms sought to move beyond efficiency and management to comprehensive program decisions based on notions of comprehensive

and rational decision making. Zero-based budgeting, another variant of comprehensive budgeting, also enjoyed a brief popularity. These systems failed to displace incremental patterns based on line item budgeting,^[26,27] although they did leave a legacy biased toward more analysis in the budget process. In 1974, the Congressional Budget Reform Act gave Congress its equivalent to the Office of Management and Budget in the Congressional Budget Office, and provided a highly capable source for budget estimation and appropriation scorekeeping. The budget resolution and the budget committees also helped Congress assume some comprehensive planning functions for the budget at the start of its budget process. Joyce suggested that these comprehensive reforms were only partially successful, but that they did leave a legacy favoring greater analysis, and zero-based budgeting, with its concentration on levels of effort around the budget base, has led to target-based budget systems at state and local levels. Joyce noted that the period after 1985 was mostly occupied with deficit reduction measures with GRH I and II and the various Budget Enforcement or Balanced Budget Acts, as well as a resurgence of performance-based budgeting focused on evaluating the results of government spending with the Government Performance and Results Act of 1993. Rubin^[28] argued that two additional emphases should be added to Schick's framework to represent trends from 1970 through the 1990s—prioritization and accountability. This is a useful clarification, but if prioritization is understood to be a primary emphasis in planning and accountability in control, then Schick's framework may stand.

OBSERVATIONS

Schick's powerful analytical construct helps us to think about current budget reform efforts. Clearly, the Chief Financial Officers Act of 1990 is a control mechanism. It is focused on budget execution, fiduciary concerns, and correct and appropriate spending of budgetary funds. With its emphasis on auditable financial statements for the federal government and individual agencies, it is concerned that dollars of input be spent for correct and appropriate purposes; that fraud, waste, and misuse funds be avoided; and that the public be able to trust their government to faithfully administer budgets within the parameters in which they have been passed. The Government Performance and Results Act of 1993, however, clearly emphasizes the management aspects of budgeting, with its emphasis on outputs and outcomes, and their costs. It pushes beyond the propriety of control aspects to efficiency and effectiveness, and even beyond with an emphasis on outcomes—for example, measurably more justice or measurably

less poverty. With linkage to strategic planning efforts, it also moves toward a planning orientation and one that has rather widespread input to it.

Schick's analysis is also a caution about the difficulty of budget reform. For example, reforms that emphasize one element usually impair another; increased control usually means decreased management. Thus, balancing these concepts is important. Finally, while no magic formula for a good budget process has been discovered, despite strenuous efforts, modern American budgeting at the federal level is remarkably accessible to its citizens. In a democracy, much should be made of this. Moreover, budget reformers remain remarkably persistent about ensuring that government should act as a wise fiduciary agent, that decisions reflect attempts to get the most value from the dollars spent, and that government target important and achievable ends. There is much to praise in these efforts.

Budget Stabilization Fund

Yilin Hou

*Department of Public Administration and Policy, University of Georgia,
Athens, Georgia, U.S.A.*

INTRODUCTION

The budget stabilization fund (BSF), popularly called the “rainy-day fund” (RDF), is a fiscal device used by subnational governments to store extra revenues during economic booms for use in economic downturns to supplement inadequate resources for meeting outlay demands. Since the early 1980s, this countercyclical device has attracted increasingly more academic attention.

ORIGIN

The concept and practice of countercyclical reserves date back to Biblical times: Joseph saved Egypt from a great famine by storing up food in years of harvest.^[1] In the American government system, the BSF also enjoys a relatively long history, tracing back to the second half of the 19th century.^[2] With ineffective controls and too frequent transfers, many cities then had difficulty keeping departmental spending within budgeted levels; so the cities created contingency funds for emergencies.^[3] Early contingency funds were very small as a percentage of the budget or in absolute amounts^[3] (for example, Boston reserved only a quarter to half a percent of appropriations for emergencies and Cincinnati reserved \$50,000 for each half-year period). Rules regarding the use of the funds were developed involving consensus between the executive and legislative branches^[3] (in Boston, the city auditor could transfer from this fund only when he was directed to do so by the mayor, with approval of the council’s committee on finance. Council approval often had to be majority. In Cincinnati, mayoral direction had to be accompanied by consent of two-thirds of the council, while Minneapolis demanded supermajority approval—20 out of 26 council votes).

The earliest use of the name “rainy-day fund” was by New York City in the 1930s. The NYC rainy-day fund had inadequate restrictions on approval procedures and an insufficient mandate on replenishment; its balance was very “modest” by the early 1960s. “When NYC borrowed for operating expenses, it also decided to make use of its rainy day fund”^[4] (this is a comment by Mr. Ted Weiss who, in the early 1980s,

was chairman of the House Subcommittee on Intergovernmental Relations and Human Resources. Mr. Weiss was on the New York City Council in the early 1960s). The fund soon went into disuse and was forgotten. The lesson is apparent: a BSF cannot exist long without restrictive approval procedures. A consensus mechanism between the executive and legislative branches is a necessary feature.

At the state level, New York was the first to adopt a formal BSF (1946)—the tax stabilization reserve fund—“as a safeguard against possible future declines in revenues.”^[5] It should be noted that states give their BSFs different names. Ohio first used the name “budget stabilization fund” (1981); Michigan adopted a more descriptive name—“countercyclical budget and economic stabilization fund” (1977).

EVOLUTION

From Contingency Funds to General Fund Balances

Early contingency funds were created out of operational necessity, but maintaining the funds, especially when the financial condition was strong, often encountered intense political pressure. Clow^[2] mentioned that although they saw the strong management and operational rationale behind the fund, most finance officers involved in setting up the reserves were unwilling to stand the related outside pressures. They even preferred not to have a reserve fund.^[2]

As a consequence, finance officials often resorted to “unofficial” ways to end up with general fund balances (GFB)—money that they could use for contingencies. One way was to intentionally underestimate revenue or overestimate expenditures. Another way was to designate GFB for some purpose they knew would not occur or on which the entire designated amount would not be spent. This represents a tacit transformation of a contingency fund into GFB through management gimmicks.^[2] [Clow records that such dilemma had led to the purposeful complication of the contingency account by financial officers (e.g., treasurers), so that politicians could not easily make clear how much balances were available].

Countercyclical Role of General Fund Balances

The development of GFB as a countercyclical fiscal tool is closely related to balanced budget requirements (BBR) in the states. The requirements, in one form or another, are all in stock instead of in flow by nature.^[6–8] Thus instead of rigidly requiring each state to balance their budgets in each fiscal year (or each budget cycle for those biennial budget states), the BBRs allow states to balance over the years, creating the need and chance for the establishment of countercyclical reserves. A good illustration is that while most states require their governor to submit and sign and their legislature to pass a balanced budget, allowing deficit carryover into the next budget cycle is a common article in state BBRs. Gradually, states developed the practice of building up their GFB during boom years to help mitigate revenue shortages in downturns. Historical data confirm this proposition. From 1957 to 1984, over the cycles of six national recessions, GFB of the state and local sector in aggregation grew substantially during boom years (Table 1, Panel B) and the balances depleted very quickly in lean years (Table 1, Panel A). Professional organizations such as the National Association of State Budget Officers (NASBO) and Government Finance Officers Association (GFOA) have also advocated maintaining a certain amount of GFB as one of the “best practices” (for details, see Refs.^[9,10]).

General Fund Balances to Budget Stabilization Fund

General fund balances, however, became easy targets of attack by voters in more recent times, as in the case of Proposition 13 in California. Taxpayers in many states through referendum voted into effect tax and expenditure limitations to restrain state and local governments from keeping large GFB. The vulnerability of GFB made officials increasingly aware of the advantages of a properly structured countercyclical fiscal tool as a more reliable and easier-to-operate vehicle that is protected by law from spending pressure.^[4,11,12] This device is the budget stabilization fund.

DEFINING BUDGET STABILIZATION FUNDS

The fact that the BSF is a useful instrument to save assets during booms for use during recessions has been recognized by state as well as federal legislators,^[4,13,14] professional organizations^[10] rating agencies,^[15] and scholars.^[12] While there is a consensus regarding the utility of BSF, there does not seem to be consensus

yet on what a BSF is or what key structural features a BSF must possess to qualify as a real BSF. GFOA and NASBO, for example, list different features as essential for a BSF. The lack of consensus has led to confusion and misuse of the concept, which in turn causes inaccuracy in data collection.

Synthesizing past literature and related legislative history and examining the finance laws of the states identify three overarching features of the BSF. First, a BSF must have an enabling legislation as its legal basis. Second, a BSF is a countercyclical reserve fund across fiscal years or budget cycles. Finally, a BSF must be a government-wide reserve for general purposes.

Enabling Legislation

Budget stabilization funds are established with enabling legislation which describes the details of a BSF, such as its purpose(s), funding source(s), allowable balance level, procedure for use approval, replenishment after use, and so on. This legislation is the legal basis of the fund. It is very significant in several fundamental ways. First, the legislation serves as a firewall between the fund and elected officials. Executive officials cannot easily use the money at their discretion because the procedure for use approval is fairly strict in most cases. Legislators cannot readily engage in pork barrel spending with this fund either because the money is available only for predetermined purposes.

Second, the legal language creating BSFs provides a defense for elected officials against popular pressure for tax returns/refunds or overspending during boom years, especially in the era of tax revolts and expenditure limitation movements. Third, the law makes it compulsory to save when the economy is strong and state revenue goes above the expenditure needs and to replenish the fund after use, so the state can stay better prepared for revenue shortfalls.

Finally, the existence of a legal basis for a BSF serves as a dividing line between a countercyclical fiscal reserve fund and GFB, which is maintained more out of practice than as a legal requirement in response to daily operational needs. The fact that a few states do have a legally required fiscal year-end balance of the general fund does not diminish this distinction: such required balances do not go across fiscal year/budget cycles. Findings from a previous study indicate that when downturns hit, general fund balances are always the first to be depleted, followed by budget stabilization funds and other useable funds.^[12] When these resources are almost gone, tax increases, expenditure cuts, and accounting gimmicks come into use.

Table 1 State-local fiscal behavior, 1957–1984—average quarterly growth rates of aggregate general fund balances

Panel A: Behavior during recessions				
Contraction				
Peak	Trough	Revenue growth (%)	Expenditure growth (%)	Surplus change (bil \$)
1957 III	1958 I	1.7	2.9	−0.55
1960 I	1960 IV	1.9	2.1	−0.1
1969 III	1970 IV	2.8	3.2	−0.46
1973 IV	1975 I	2.6	3.3	−1.32
1980 I	1980 II	0.5	1.9	−4.7
1981 III	1982 IV	1.3	1.8	−1.66
Panel B: Behavior during expansions				
Expansion				
Trough	Peak	Revenue growth (%)	Expenditure growth (%)	Surplus change (bil \$)
1958 I	1960 I	2.4	1.5	0.34
1960 IV	1969 III	2.5	2.4	0.08
1970 IV	1973 IV	2.9	2.5	0.8
1975 I	1980 I	2.5	2.1	6.15
1980 II	1981 III	1.8	1.3	3.06
1982 IV	1984 IV	2.1	1.8	4.95

Countercyclical Reserves Fund Across Fiscal Years/Budget Cycles

The BSF is designed as a countercyclical mechanism. As a reserve to be accumulated in boom years for use in lean years, it is necessarily a mechanism that operates across fiscal years (for those states that adopt biennial budgets, it operates across biennial budget cycles). The focal point of a BSF is to “balance,” or smooth out the peaks and troughs of, revenues and expenditures through the business cycle, instead of merely the fiscal year or budget cycle.

This feature separates the BSF from working capital funds and legally required year-end general fund balances. A working capital fund serving cash flow purposes operates mainly within the fiscal year so that the government does not have to resort to the debt market for current spending before tax revenues stream in. In some cases, the working capital fund does go beyond the fiscal year, but even in those instances, its focus remains on filling in the revenue gap between two budget cycles.

In a few states (Colorado, Kansas, New Mexico, and Wisconsin), their finance laws require a balance

(surplus) of the general fund at the end of fiscal years, ranging in size between 2% and 5% of the current year general fund revenue. Given the spending pressure from politicians and taxpayers, these required balances are not guaranteed to accumulate across fiscal years or budget cycles. As such, these required year-end balances cannot serve as a BSF.

Government-Wide Reserve for General Purposes

The U.S. General Accounting Office (GAO) classifies state reserves into three categories: 1) government-wide reserves for general purposes; 2) government-wide reserves for specific purposes; and 3) agency-specific reserves for specific purposes.^[16] A BSF should be a government-wide reserve for general purposes. Any reserves for single or special purposes are not in this category. Reserve funds that are set up for use by only certain agencies in the government are not in this category either. Contingency funds as currently in use by many state governments are across-fiscal-year reserves, and they can be government-wide

Table 2 Recessions and creation of BSF

Recession	State	Creation	Fund name	First balance
1945	New York	1946	Tax Stabilization Reserve Fund	1946
1957–1958	Florida	1959/65	Working Capital Fund/Budget Stabilization Fund	1965
1969–1970	Tennessee	1972	Reserve for Revenue Fluctuations	1972
1973–1975	California	1976	Special Fund for Economic Uncertainties	1977
	Georgia	1976	Revenue Shortfall Reserve	1976
	Delaware	1977	Budget Reserve Account	1979
	Michigan	1977	Countercyclical Budget and Economic Stabilization Fund	1978
	South Carolina	1978	General Reserve Fund	1978
	New Mexico	1978	General Fund Tax Stabilization Reserve	No balance
	Connecticut	1979	Budget Reserve Fund	1981
1980	Ohio	1981	Budget Stabilization Fund	1985
	Washington	1981	Emergency Reserve Fund	1989
1982	Indiana	1982	Countercyclical Revenue and Economic Stabilization Fund	1985
	Mississippi	1982	Working Cash-Stabilization Reserve Fund	1983
	Wyoming	1982	Budget Reserve Account	1983
	Kentucky	1983	Budget Reserve Trust Fund Account	1987
	Nebraska	1983	Cash Reserve Fund	1984
	Idaho	1984	Budget Stabilization Fund	1984
	Minnesota	1984/1996	Cash Flow Account/Budget Reserve Account	1984
	Maine	1985	Maine Rainy Day Fund	1985
	Maryland	1985	Revenue Stabilization Fund	1987
	Massachusetts	1985	Commonwealth Stabilization Fund	1987
	Oklahoma	1985	Constitutional Reserve Fund	1988
	Pennsylvania	1985	Tax Stabilization Reserve Fund	1986
	Rhode Island	1985	Budget Reserve and Cash Stabilization Account	1985
	Wisconsin	1985	Budget Stabilization Fund	No balance
	Utah	1986	Budget Reserve Account	1987
	New Hampshire	1987	Revenue Stabilization Reserve Account	1987
	North Dakota	1987	Budget Stabilization Fund	1990
	Vermont	1987	General Fund Budget Stabilization Reserve	1987
	Texas	1988	Economic Stabilization Fund	1990
	Alaska	1990	Constitutional Budget Reserve Fund	1992
	Louisiana	1990	Revenue Stabilization and Mineral Trust Fund	1999
	New Jersey	1990	Surplus Revenue Fund	1993
1990–1991	Arizona	1991	Budget Stabilization Fund	1994
	Nevada	1991	Fund to Stabilize Operation of State Government	1994
	North Carolina	1991	Savings Reserve Account	1991
	South Dakota	1991	Budget Reserve Fund	1992
	Iowa	1992	Economic Emergency Fund/Cash Reserve Fund	1993
	Missouri	1992	Budget Stabilization Fund	1992
	Virginia	1992	Revenue Stabilization Fund	1993
	West Virginia	1994	Revenue Shortfall Reserve Fund	1995

or agency-specific; but on the whole, these funds are reserves *for specific purposes*, e.g., natural disasters, litigation settlements, self-insurance, and so on. Therefore contingency funds are not the same as BSF.

Strict Definition of the Budget Stabilization Fund

Thus two distinct definitions of BSFs emerge, one relatively strict and the other loose. Adopting the strict or the loose definition of BSFs will end up with quite different data sets and thereby results of empirical analysis. The strict definition is clear and straightforward

with regards to the accumulation of the fund (during good times) and purpose (to cope with revenue shortfall during recessions). It is:

A budget stabilization fund is money set aside while good economic conditions prevail and then drawn down during poor economic times to lessen the extent to which state governments will have to reduce expenditures or raise taxes to cope with a recession.^[4,9,12]

The loose definition purports that the fund is not only for temporary shortfalls, but also for any non-recurring expenditures. The latter gives this definition a much broader scope. Consequently, the loose

definition is broad enough to count a *contingency fund* as a BSF. The loose definition of the BSF runs:

A budget stabilization fund is money set aside... against the chances of 'reducing service levels or raising taxes and fees because of temporary revenue shortfalls or unpredicted one-time expenditures.'^[10]

ADOPTION OF BUDGET STABILIZATION FUND BY THE STATES

The creation of budget stabilization funds by the states has been slow. But recessions and tax revolts have highlighted the usefulness of BSF as an effective fiscal tool. Gold^[6] noticed that the chronology of BSF adoption shows close correlation between establishment of BSF and recessions (Table 2).^[17]

Every one of the earliest state adopters of the BSF—New York, Florida, Tennessee, and Michigan—came within 3 years of a previous recession. The recessions in the early 1980s made the correlation more apparent: fiscal stress that led to spending cutbacks and increased taxes as an effort to sustain funding for public services prompted 16 states (from 1981 to 1985) to establish their BSFs.^[18] Once initiated, the adoption of BSFs spread broadly among the states. Then the 1990–1991 recession further increased the number of states with BSFs.

BUDGET STABILIZATION FUND DATA

Up to now, the *Fiscal Survey of the States* series compiled and published twice a year by the National Association of State Budget Officers (since 1977) is the only readily available source that provides BSF data of the states. Many empirical studies have based their analysis on this data source. A drawback with this series, however, is that the BSF figures provided by the states and reported in the series often do not match with those in the *Comprehensive Annual Financial Reports* (CAFR) of the states. The discrepancy may be a result of various reasons. However, because the CADRs are audited financial documents, they carry weight that should not be ignored. Therefore researchers and practitioners should exercise caution in their choice of data sources.

The usefulness of the budget stabilization fund as a subnational countercyclical fiscal device is now widely recognized—over 40 states have adopted the fund and researchers have begun to pay increasing attention to its study. However, comprehensive and conclusive examinations of this instrument are still lacking.

INTRODUCTION

The discipline of economics offers the potential to apply a systematic and rational approach to public budgeting. In particular, the concept of economic efficiency can be used to identify the goods and services for which a private market does a good job of distributing and also those goods and services for which it does not perform well. This analysis can help to answer one of the primary questions in budgeting—"What should government do?"—and provides a clear justification for the answer. Further, economic methods such as cost-benefit analysis (CBA) can provide answers to more specific budgetary questions, such as "Which program should be funded?," "How beneficial is the program?," and "When will the benefits and costs of the program be realized?" At the same time, there are some limitations with the application of economics to budgeting.

ECONOMIC EFFICIENCY AND GOVERNMENT

Markets are economically efficient if firms are producing output at the minimum cost and if those consumers who value the goods most get them. When this is not the case, a market failure exists. Market failures can exist for several reasons, specifically public goods, externalities, monopoly, and information problems in the market. When a market failure exists, the private market will not be efficient. From an economic viewpoint, this provides the central justification for government supply of certain goods or services, as appropriate government action can correct the market inefficiency. Musgrave referred to this rationale as the allocative role of government.^[1] For example, pollution is an undesirable by-product of the production of many desired goods, such as steel. People near the factory would be willing to pay to have the pollution reduced but find it difficult to organize to do so. The government can correct the market failure by taxing polluting firms for the cost to society of their emissions. This tax induces the firm to internalize the external costs into their production decisions. They may continue to pollute but, typically, will do so at a lower level. It is argued that without some government

intervention into this market, the externality will continue and the market will remain inefficient. In this manner, the government can make the economy more efficient. The same is true of the other types of market failures and is one of the justifications for programs such as national defense and food safety (public goods), zoning and anti-nuisance ordinances (externalities), antitrust litigation and price regulation (monopoly), and public pensions and health care regulation (information problems).

In 1960, Coase pointed out that the presence of a market failure should not necessarily lead to the conclusion that government should intervene.^[2] In the pollution example, it might be possible for the residents of the community to organize themselves in some other fashion to negotiate with the polluting firm. How possible this is depends on the transaction cost of their mobilization and collective action. Coase's point provided one of the intellectual justifications for the subsequent privatization movement. More generally, just as markets can fail to be efficient, so can governments. Therefore, the appropriate comparison in the face of any inefficiency is between the two institutions of the market and the government, and further between the various service provision arrangements possible. Some possible arrangements are direct government provision, intergovernmental agreements, contracts, franchises, vouchers, and voluntary action. This perspective ties these economic concepts to the public administration literature on policy implementation and service provision in a way that can help the student and the practitioner of public administration to conceptualize the rationale for action and the range of alternatives in providing services. In turn, this shapes the "big picture" of the budget, as well as the options a budget official may consider.

Musgrave's other two roles for government are stabilization and distribution.^[1] Stabilization refers to macroeconomic concerns about issues such as unemployment, inflation, international trade, monetary policy, and interest rates. The distribution role refers to concerns about the distribution of income and other resources among members of society. Of course, one might add to these roles. But Musgrave made it clear that other concepts besides economic efficiency were relevant in determining government programs and budgets.

Okun advanced the argument that in many policy decisions, there is a trade-off between efficiency and equity.^[3] For example, in health care, a pro-efficiency viewpoint would argue for reliance on the private market, with little or no interference by the government. Those who valued the services highly and could afford them would get them with little interference, and producers would have incentives to respond to consumers through the market. However, those who could not afford treatment might have to go without. A pro-equity argument might de-emphasize the private market as a basis for health service provision in favor of public provision or arrangement of health services, ensuring access and coverage to all. However, this strategy would likely require higher taxes, limit provider incentives, and create non-price forms of rationing that might be troubling. Okun advocated balancing these two social goals of efficiency and equity. Although he realized that this balance was difficult to strike in practice, many economists see it as a useful construct for policy decisions.

FISCAL FEDERALISM

The concept of economic efficiency can also help to sort out which level of government (national, state/provincial, or local) should provide which services. Oates pointed out that some goods are local public goods (e.g., public safety), whereas others are more appropriately supplied at the state, regional, or national level.^[4] Local public goods are characterized by a smaller scope of impact. For example, fire safety in Boston is important to residents of that city, and perhaps in other nearby cities, but not to Chicago. The efficiency criterion would dictate that citizens of Boston should decide what level of fire protection they want and the amount they are willing to pay for it. Because Bostonians' decisions have little or no cost and benefit on people outside that area, the correspondence principle would dictate that the geographic area of the benefit and the taxes to support the service should coincide. If tastes for public services and tax levels vary among communities, then this implies that levels of service will not be and should not be uniform. Further, because different goods have different spatial distributions of costs and benefits, a federal system has the potential to be more efficient than a centralized system, as it better allows for local variation.

POSITIVE AND NORMATIVE APPLICATIONS OF ECONOMICS TO BUDGETING

A positive theory attempts to explain "what is," whereas a normative theory attempts to explain "what

should be." Economic theories can be either positive or normative. A common criticism of the economic perspective of government action is that it is not a good positive model; many of the decisions about programs and public spending are political and do not follow this or any other prescribed theory about what government should do. For example, despite the fact that it does not address any market failure, education is provided publicly in many nations. Indeed, education is currently the largest functional area of spending among all governments in the United States.^[5] Further, the structure of American government often makes it difficult to enact efficient policies. The institutions of constitutional separation of powers, bicameralism, and federalism require that any policy proposal receive majority approval among many different political bodies. This tends to produce policies that have a broad distribution of benefits and a vague distribution of costs. Efficient policies, however, tend to have explicit and visible linkages between costs and benefits. Thus, as a general rule, the policies emanating from U.S. governments are not particularly likely to meet the strict standard of efficiency. This may be less true of unified governments, such as parliamentary systems.

Economists have produced a number of positive models relevant to government budgeting. The best known is the median voter model, which assumes that in each polity a single individual is the decisive voter. The preferences, income, and prices faced by this individual then help to predict their vote and, in turn, the government's budget. A great number and variety of articles have been published on this model, with mixed conclusions (for a review, see Ref.^[6]). Despite some problems with this model, it does demonstrate the attractive traits of positive economic models. They are testable and relatively simple and can be used to describe, explain, and predict government behavior.

Normatively, it is often argued that the economic perspective is flawed. There are many different angles that this argument takes, but a common one is that it is undemocratic. If a majority of the citizens want to tax themselves to provide a program that they want, then this alone is a sufficient justification, whether or not there is a market failure. Certainly, this criticism has merit; yet, it does seem that the efficiency rationale serves as one good reason—among many—for justifying government programs. The efficiency rationale is grounded in the utilitarian justification of achieving the greatest satisfaction possible for all individuals given social resources available. Although utilitarianism has its limits as a guiding social principle, most economists are comfortable with it, because it maintains the focus of policy on the individual and allows individuals to make their own decisions. Philosophies that put the government first and the individual second

tend toward collectivism. As with most normative debates, there are compelling arguments on either side.

COST-BENEFIT ANALYSIS

Most programs entail gains for some and losses for others. A vexing problem is how to resolve these distributional consequences, yet still be assured that the program is in the social interest. Economists have contributed three decision rules to attempt, which answer this question (for a detailed discussion, see Ref.^[7]). The strictest test is the “Pareto rule,” which states that a program should be undertaken if it makes at least one person better off and no one worse off.^[8] Conceptually, this is appealing, but practically it is of limited help because few programs leave no one worse off. A second test is the “Kaldor-Hicks rule,” which states that a program should be undertaken if those benefiting from it could compensate those hurt by it and still be better off. The winners need not actually compensate the losers; this test is conceptual rather than actual.^[9,10] The third, and least strict, test is the fundamental rule of CBA—do all projects with a positive net present value of benefits minus costs. (Present value is a method for adjusting economic values over time, so that dollar values of costs or benefits realized at different times may be compared.) These three tests guide decision makers in selecting programs with distributional consequences. The strictness of the standards of these tests is important because it affects which programs will be selected, with the fewest programs passing the Pareto rule and the most passing the CBA rule.

Once a market failure is identified and service provision arrangement is chosen, several other operational decisions need to be made about the design and scope of the program. CBA has been applied to budgeting to guide decisions about the advisability and design of programs, as well as a means to justify expenditures. In deciding about whether to adopt a program, CBA would recommend its adoption if the net value is positive and recommend against it if it is negative. If there are several competing programs and one were able to pick only one of them, CBA would recommend selecting the program with the highest net benefit. If one were trying to determine the total amount that should be spent on a collection of programs, CBA would recommend doing all those that had a positive net benefit and none of those that did not. Although the decision rule is simple and the application flexible, CBA does require care in identifying what values should be included; how they should be measured; how risk, timing, and uncertainty are dealt with; and the discount rate used to recognize the time value of money.

Although it is becoming more popular, CBA is not routinely used in most agencies. It requires advanced technical skills, and the details of the analysis can be difficult to explain. Further, many non-economic considerations come into play in decisions about public spending. Despite this, the growing demand for accountability in the public sector and the business-like “bottom line” that a CBA can deliver has recently made this approach more attractive to administrators, policy makers, and the public.

AN APPLICATION TO THE BUDGETARY PROCESS

In a classic piece, Lewis argued that the economic approach of marginal analysis could be productively applied to public budgeting.^[11] He suggested a budgetary process, where, in addition to their appropriation requests, each agency would also detail how their request would change if the appropriation were, for example, 10–20% lower or higher. This would present decision makers with packages of programmatic decisions meant to facilitate, if not force, a comparison both among programs and between public and private spending. The goal of such an approach is to compare the relative value of programs, in accomplishing social goals and making the opportunity cost of budgetary decisions readily apparent. This recognizes the basic economic insight that it is the marginal or additional unit that determines the value of a good or service.

The approach Lewis described foreshadowed many budget reforms that have been implemented (e.g., target-based budgeting, zero-based budgeting, and program budgeting), as well as institutional arrangements (e.g., the U.S. Congressional Budget Act of 1974, which in part attempted to present Congress with explicit decisions of this type). Studying these reforms illustrates the strengths and weaknesses of the application of basic economic principles to public budgeting. Some governments incorporate these principles into their process of budgeting, although clearly political, and other considerations are relevant and often more important.

It is, therefore, apparent that any thoughtful practitioner of budgeting should be aware of these principles of economic analysis, as both a theoretical foundation and an analytical tool that can be used. Certainly, other valuable perspectives differ in their fundamental premises and normative approach to public budgeting (see, e.g., Ref.^[12]), and so the practitioner may not embrace the economic approach. However, it will continue to be relevant to this central function of government.

Budgetary Balance and Deficit Controls

William R. Voorhees

School of Public Affairs, Arizona State University, Tempe, Arizona, U.S.A.

INTRODUCTION

Budgets are generally considered to be in balance when an organization's inflow of economic resources is equal to its outflow of economic resources. When an organization allocates resources beyond those currently available, a deficit occurs and additional resources must be collected in future periods reducing future opportunities. In its simplest form, budgetary balance is expressed by the budgetary equation:

Revenues = Expenditures

In a neat and tidy world, this equation would serve us well; however, in the real world, the equation is seldom as simple as it appears. Economic stability, political ideology, fiscal management skills, and fiscal policy will all influence whether a budget is in balance. Even when the budgetary equation appears to be in balance, it may be so only after an application of "smoke-and-mirror gimmickry," such as accelerating revenues from or delaying expenditures to subsequent periods. When the budgetary equation is not in balance, surpluses or deficits are the result.

There are two basic categories of budget deficits: cyclical and structural. Cyclical deficits are the result of downturns in the economy. When downturns occur, expenditures are prone to increase while revenues decrease, often resulting in a cyclical deficit. Structural deficits, however, are the result of permanent deficits resulting from the expenditure or revenue structures making up the budget.

CYCLICAL DEFICITS

When considering the budgetary equation and balance, it is necessary to understand how forecast accuracy affects each side of the budgetary equation. On the revenue side, forecasts are generally accurate in the United States, with states normally having less than a 2% error in their revenue forecasts. The problem arises with the inability to forecast turning points in the economy in time for inclusion in the budget. Turning points represent the peaks and valleys of a cyclical economy and because most revenues are conditional on the state of the economy, the accuracy of the revenue forecast is

affect when an economy turns. Because estimating turning points is extremely difficult, governments are often faced with revenue shortfalls when the economy turns downward. Likewise, when the economy begins a growth period after an economic downturn, revenues will often exceed forecasts resulting in excess revenues.

The behavior of expenditures during cyclical changes presents officials trying to maintain a balanced budget with equally challenging problems. During periods of economic downturns, expenditures will generally increase due to mandatory spending. Entitlements such as food stamps, unemployment relief, and welfare will increase during economic downturns as more of the population find themselves unemployed or working for lower wages. These additional expenditures create additional fiscal stress at exactly the time when revenues are falling. As workers lose jobs and wages fall, revenues derived from income and consumption taxes are affected correspondingly.

Recissions and Supplemental Budgets

The primary tools that governments have to fight cyclical imbalance are recissions and the supplemental budget. Recissions are cuts to the budget after the budget has been passed. Because governmental expenditures are in reality, planned activities of the government, a recission can present severe disruptions to government operations. Often, because expenditure commitments have already been made, recissions may not come from programs that either politicians or citizens want cut.

Recissions result in budgetary cutbacks that can come in several forms, including line item reductions, across-the-board departmental reductions, or programmatic reductions. Line item reductions may result in hiring and salary freezes, early retirement, unpaid furloughs, layoffs, reduced maintenance on equipment and fixed assets, and elimination of new equipment purchases.^[1] Departmental cuts may be across the board, with each department required to contribute a fixed percentage. Across-the-board cuts, where all departments bear an equal burden, are often contrary to optimal budget allocation and result in both high- and low-priority programs being cut equally. However, programmatic cuts fall on specific programs, especially those that are allocated large amounts of funds and

that are not federally funded, mandated, or supported by earmarked funds.^[2]

In the case of an upturn in the economy and excess revenues, supplemental budgets can be appropriated after the original budget has been passed. Supplemental budgets allow lawmakers to add additional dollars to the budget through additional expenditures or tax expenditures. Supplemental appropriations may fail to provide optimal resource allocations, and they often have limited citizen and legislative participation in the allocation of the additional resources.^[3]

Stabilization Funds

To mitigate the problems of forecasting, many states have adopted reserve funds to maintain budgetary balance. Typically, these funds go by several names, including rainy day funds, contingency funds, and stabilization funds. Although any of these funds can be used to smooth out revenue shortfalls and higher expenditures due to economic fluctuations, only stabilization funds are used specifically for that purpose.

Three features—fund-sized, funding mechanisms, and fund expenditure—identify the structure of a stabilization fund. The most common suggestion for fund size at the state level is a 5% reserve.^[4] In reality, some states seem not to have set target amounts for their funds, whereas other states have statutes controlling and limiting fund size. In 1998, most states with stabilization funds had balances between 2% and 14%.^[5]

The second feature, funding mechanisms, can vary from predefined constitutional requirements to no requirements at all. For example, South Carolina requires a 5% balance in the fund and, if the fund is less than the 5% amount, a minimum of 1% must be added each year until the 5% minimum is achieved.^[6]

Finally, fund withdrawal varies considerably among states with some states using a formula approach that is triggered in times of fiscal distress; other states withdraw funds after either a majority or supermajority vote of the legislative; and, in still other states, the executive need only declare a need to use stabilization funds.^[7]

At the municipal level, few cities have opted to implement stabilization funds for economic smoothing. Interestingly, those cities most sensitive to economic cycles are no more likely to establish stabilization funds than the least sensitive. In fact, those municipalities least dependent on cyclical revenue are most likely to institute such funds.^[8]

STRUCTURAL DEFICITS

Structural deficits are the result of permanent deficits resulting from the expenditure and/or revenue

structures of a government's budget. Whereas cyclical deficits disappear during economic growth cycles, structural deficits can only be corrected by permanently reducing expenditures or increasing revenues. Because of balanced budget requirements and debt limitations, state and local governments generally have fewer problems with structural deficits than the federal government. Fig. 1 shows the federal government deficits as a percentage of the gross domestic product (GDP). It is useful to consider the deficit in respect to the GDP to offset economic growth trends. In looking at the figure, a structural deficit is clearly apparent from 1975 to 1995, although some might argue that a structural deficit existed even prior to 1975.

Process Controls at the State Level

A primary means of controlling budgetary balance is through controls on the budgetary process. Such process controls may require specific reports or budgetary formats, allow for executive veto of budgetary items, or consist of laws that mandate a balanced budget. Budgetary formats may or may not place emphasis on the budgetary balance aspect of the appropriations process. Formats such as zero-based budgeting place a stronger emphasis on budgetary balance with their built-in mechanism for identifying potential budgetary cuts. In addition to traditional budgets, some states are now requiring tax expenditure budgets that aid in identifying revenue reductions that may lead to budgetary imbalance if other actions are not taken to increase other revenues or decrease expenditures.

The executive veto has often been suggested as a primary tool of the executive in maintaining budgetary balance at the state level. Even when the executive fails to exercise a veto, the threat of the veto may prevent the legislature from adding appropriations they know the executive has threatened to veto.

Several forms of the veto exist, including the popular line item veto. The traditional line item veto permits the executive to delete one or more budget lines. In some states, the item veto is extended to allow the executive to change the wording of the legislation. Currently, only the governor of one state has no veto power, whereas 42 states allow a line item veto, 40 allow an item veto of appropriations, 14 allow veto of selected words, and 3 allow the governor to veto and change the wording of an appropriations bill.^[9] It should be noted that veto power was given to the U.S. president in 1995 with passage of the Line Item Veto Act, but was rescinded in 1998 when the Supreme Court ruled it unconstitutional. The effect of the line item veto power was considered to be miniscule during the short time the president had the authority.^[10]

Fig. 1 U.S. receipts, outlays, and deficits/surpluses as percentage of GDP. (From the United States FY 2002 Budget.)

Other controls may take the form of laws that require states to have budgetary balance. These laws may set requirements at different points in the budgetary process such as submission of a balanced budget by the executive, passage of a balanced budget by the legislature, or a requirement for the executive to sign a balanced budget. Often, these requirements are written into the state's constitution, which generally requires a supermajority to modify. Statutory requirements may also be used by states to implement balanced budget requirements; however, in times of fiscal stress, statutory requirements are more easily circumvented.

Some states also have laws that require the state to achieve balance at year end (Table 1). In a survey conducted by the General Accounting Office (GAO), it was found that 39 out of 49 states required budgetary balance at year end. At the same time, it was found that 21 of those 49 states were allowed to carry over deficits to the following years. The same GAO report suggests that year-end budgetary balance is often "more of a perception than a legal requirement."^[11] For instance, in the state of Massachusetts, the law is written such that the budget may be balanced through the use of loans.^[12]

Table 1 Balance budget requirements in the states

	States with balance requirements ^a	Constitutional	Statutory
Governor must submit balanced budget	44	32	26
Legislature must pass balanced budget	40	33	18
Governor must sign balanced budget	35	30	17

^aSeveral states have both statutory and constitutional requirements. States are counted only once.
Source: NASBO, Budget Processes in the United States, 1999.

For states that do have budgetary balance requirements, the funds covered by the requirements may not always specify which funds fall under the requirement. The focus of balance regulations is usually directed at governmental operations and the general fund. Unlike the federal government, capital funds at the state level are generally excluded from budgetary balance requirements. Less clear is the manner in which fiduciary and enterprise funds are affected under balance requirements. In the case of enterprise funds, bond covenants may necessitate budgetary balance.

Process Controls at the Federal Level

At the federal level, the U.S. Congress has passed several pieces of legislation to control deficits. The first major effort by Congress to control deficit spending was the Anti-Deficiency Act of 1870, which prevented agencies from obligating more funds than appropriated and then submitting “coercive deficiency” requests to Congress to pay their obligations.

The Budget and Accounting Act of 1921 was the second major effort by Congress to control budgetary expenditures. This act centralized fiscal processes by codifying the president’s budget and creating both the Bureau of the Budget and the GAO. The result of the Budget and Accounting Act of 1921 was to shift substantial budgetary power and responsibility from the Congress to the executive branch of government.

In 1974, Congress passed the Congressional Budget and Impoundment Control Act, establishing the Budget Committees in both the House and the Senate. It also modified the budgetary process in Congress by requiring a Budget Resolution at two different points in the budgetary process, a tax expenditure analysis, a current services budget presentation by the president, and the creation of the Congressional Budget Office. It was the intent of Congress to create a budgetary process that both enhanced their control over the budget, and integrated revenue and appropriation decisions.

Persistent deficits of the late 1970s and early 1980s caused by increased budget complexity due to the growth of entitlements and multiyear spending, a structural imbalance due to the lost revenues of the Economic Recovery Tax Act of 1981, and increased budget vulnerability with respect to incorrect estimates and forecasts prompted Congress to once again address the budgetary process with attempts to limit expenditures.^[13] In 1985 and again with modifications in 1987, Congress enacted the Balanced Budget and Emergency Deficit Control Act (Gramm–Rudman–Hollings) with the intent of lowering the deficit and ultimately balancing the budget. This legislation

attempted to bring more fiscal discipline to the budgetary process by establishing new deadlines and deficit targets. If the deficit target was exceeded by more than \$10 billion, then automatic cuts or sequestration would be implemented. Sequestration required that the president make across-the-board spending cuts that were evenly divided between both domestic and defense programs to achieve the deficit targets. Because debt interest and most entitlement programs were either totally or partially exempt from budgetary reductions, the bulk of the reductions under sequestration came from discretionary appropriations. It was believed that the sequestration process would be so distasteful that Congress would attempt to avoid it at all cost. What was not anticipated was that Congress would devise means through the use of delayed appropriations and other “smoke-and-mirror gimmickry” to avoid the consequences of sequestration.

The deficits continued, forcing Congress to revisit the problem of budgetary balance in 1990 by passing the Budget Enforcement Act (BEA). The BEA created three categories of spending—domestic, defense, and international aid—with each category having separate deficit targets. The breach of a spending target in any single category would result in sequestration for programs in that category only and, if appropriations for one category fell below the target, the difference between the target and the appropriation could only be used for deficit reduction. This was to create a unique problem with defense appropriations in 1992. Due to the dissolution of the Soviet Union, defense spending realized a peace dividend, which spurred many legislators to proposed using the defense reductions for spending in the other two categories; however, by law, these categories were walled off preventing movement of funds from one category to another. After a protracted battle in Congress, the walls held and the reductions in defense spending were applied to deficit reduction.^[14]

In addition, BEA required that increases in direct spending or revenue reduction be financed on a pay-as-you-go basis (PAYGO) and prohibited any net change in the deficit. In effect, this requirement tied new spending to either tax increases or cuts in other expenditures, making new expenditures unlikely.

The Omnibus Reconciliation Act of 1993 revised and extended spending caps and significant reductions were realized in the budget between 1992 and 1997, with the budget deficit decreasing from \$290.4 billion to \$20 billion in 1997. The Balanced Budget Act was passed in 1990, requiring a balanced budget in the year 2002. This act once again revised and extended discretionary spending limits and PAYGO requirements, and made permanent a 5-year horizon for budget resolutions.^[15] With the Balanced Budget Act of 1997 in place along with strong revenues from a thriving

economy, the budget was balanced the following year, well ahead of the 2002 deadline.

CONCLUSION

The budgetary process is faced with two forms of deficits: cyclical deficits that are a result of the economic cycle, and structural deficits that are a result of the permanent imbalance between the institutional structures designed to raise resources and those design to use resources. Cyclical deficits are often solved through recissions and cutback management techniques. Structural deficits have been found to be more difficult to solve because they tend to pit various groups of resource consumers against each other over the long run. Governments have implemented various budgetary processes in attempts to control deficits, sometimes successfully and often to no avail. Often, the legislation was focused on integrating the revenue and expenditure decision-making processes. In the end, however, budgetary balance is probably best achieved through a combination of not only a strong economy and reasonable process controls, but also the political will of the groups competing for resources.

Budgetary Reforms in Southeast Asia

David Seth Jones

*Department of Public Policy, University of Brunei Darussalam,
Gadong, Brunei*

INTRODUCTION

In recent years, the states of Southeast Asia have implemented a range of budgetary reforms as part of a wider agenda to raise their levels of governance. The changes introduced have varied in their nature and extent according to the culture, political system, economic development, and administrative capacity of each country. In some cases, they have built upon an already well-developed system of budgetary management. In others, they represent the first serious steps to creating a viable budgetary system as in Laos, Vietnam, and Cambodia.^[1,2] This study examines the reforms implemented in the various countries concerning the different aspects of budgetary management, and highlights in the concluding section the challenges for further reform.

CASH MANAGEMENT IN BUDGET EXECUTION

An important area of budgetary reform in Southeast Asia is controls during disbursement to ensure that cash funds are available to meet current commitments. Too often in the past, cash flows and disbursements have been poorly regulated. This has meant that cash spending has not been well distributed during the financial year. Funds have dried up if the budget allocation has been disbursed too early. Alternatively, a spending spree may occur at the end if it is realized that there remains a surplus of cash that has not been used. In addition, poor cash management controls have allowed government agencies to undertake commitments and issue payment orders for which cash funds are not available. The upshot is that expenditure commitments are either delayed or shelved and the institutions that control the release of funds can exert arbitrary power over budget execution, which allows substantial deviations from the budget. This practice has been particularly noticeable over many years in Indonesia and was prevalent until recently in the Philippines.^[3,4] A further contribution to poor control of disbursements is the lack of proper authorization, verification, and accurate documentation of all payment transactions, which has undermined budget implementation management in Indonesia.^[4]

Consequently, several governments in the region have introduced measures to enable better management of cash funds by spending ministries and agencies, including tracking of cash transactions from month to month and assessing the status of their account balances. The Cambodian government is one which has taken seriously the need to do this. Monthly reports are now drawn up that provide details on payment transactions of government departments over the previous month and the status of their account balances. In addition, payment orders issued by government departments are strictly tied to cash availability for the forthcoming month. What is more, when a budget allocation has been finalized for the forthcoming financial year, ministries and agencies are then required to project their spending requirements for each month of the year. As the year progresses, they can identify the variance between how much was spent in each month and in the year to date, and how much was projected.^[5] In the Philippines, under a recent measure, the availability of cash funds is ensured through the automatic release of 80% of a budget appropriation for a spending institution at the beginning of the financial year.^[3]

DECENTRALIZATION

Common to several countries in Southeast Asia, which have introduced democratic reforms, has been a subsequent decentralization of public administration through the creation of elected local authorities with responsibility to provide public services and to manage and implement their own budgets based mainly on central government grants. The decentralization reforms have been recommended and guided by international organizations, such as the World Bank, Asian Development Bank, UNDP, and the IMF, which have argued that local institutions are better able than central administration to identify and target the most pressing needs within their locality.

One example has been Indonesia, where a newly decentralized system of public administration was created in 2001. The decentralization included delegating to elected regional parliaments discretion in apportioning central government block grants in the light of regional priorities. The central government is obliged

to transfer a minimum of 25% of its revenue to the regional authorities, which also are given limited powers to levy local taxes.^[6-9] Cambodia is the most recent example of decentralization. In 2002, elected local government structures were created known as commune councils, following the first local elections. Each commune council is given a block grant from the Commune Fund managed by the central government. This grant can be spent by the commune council in accordance with local needs, especially on poverty alleviation and employment creation schemes.^[10-12]

TRANSPARENCY

Another important aspect of budgetary reform is the establishment of more transparent systems of state financial management, which is vital to ensuring control and accountability in the budget process. At the beginning of the financial year, transparency necessitates the publication of a wide-ranging budget documents submitted to the legislature covering current and capital expenditures, government loans and grants, sources of revenue, and state assets and liabilities. Expenditure should be broken down according to ministry, department, program, activity, and object of expenditure (staffing, supplies, etc.).^[13]

At the other end of the budgetary process, transparency hinges on proper structuring and reporting of the public accounts at the end of the financial year in line with international accounting standards. The accounts should show the expenditures incurred, revenues collected, variance from the estimates and projections in the budget, extent and type of debt issued, as well as a detailed balance sheet showing assets (including capital reserves and equity holdings) and liabilities (including contingent liabilities) of the government. The accounts should be drawn up based on double-entry book keeping.^[13]

In most of the countries of the region, steps have been taken to improve budgetary and public accounts disclosures, especially in tandem with the strengthening of accountability institutions, such as the supreme audit institution and the legislature. The Philippine government has taken seriously its duty to disclose budget information in a detailed and comprehensive format following the introduction of democratic politics in 1986. The budget document submitted to the legislature, and authorized by the passing of the General Appropriation Bill, lays out for each spending institution, expected expenditures for its programs and objects of expenditure, including transfers and loans. It also spells out in detail assets and liabilities of the state.^[3]

An example of improvements in the disclosure of public accounts is provided by the Government of

Vietnam, which has sought to bring its accounting standards in line with International Accounting Standards (IAS) as part of its long-term effort to create a modern market and trading economy.^[12,14] The Government of the Philippines has followed a similar path in adopting IAS as the basis of its budget accounting.^[15] Likewise in Indonesia, new accounting standards for public finance were implemented in 2002 to include double-entry bookkeeping and disclosure of the overall balance sheet of the government, which had hitherto not been done.^[16,17]

A continuing practice that erodes transparency is off-budget expenditure. All too often ministries and other public agencies engage in spending outside and unrelated to any legal appropriation within the budget. Off-budget expenditures may escape disclosure and scrutiny, and thereby erode accountability. They can also seriously distort the overall soundness of a state's public finances. The opportunity for off-budget expenditure arises particularly when there are many small bank accounts in which budget funds are deposited, as opposed to a single consolidated account.^[13]

To tackle off-budget expenditure, the Indonesian government has initiated measures to create a single consolidated account for all government revenue, out of which all public spending will be funded and cash disbursements undertaken. It is hoped this will reduce the loopholes that had hitherto existed for off-budget spending through the myriad bank accounts for public funds, with one or more for each spending agency.^[16-19]

ACCOUNTABILITY

Another aspect of budgetary reform has been the strengthening of watchdog functions to ensure that: a) spending and revenue raising comply with laws and regulations governing financial procedures; b) public monies are disbursed in accordance with what has been authorized in the budget; c) and mismanagement, waste, and corruption are reduced. Achieving a more accountable system of financial management of public resources has necessitated improvements in auditing, legislative scrutiny, and anticorruption programs.^[13]

Central to creating effective oversight of public spending is the strengthening of the external audit of government finances through the supreme audit institution (SAI). In most Southeast Asian countries, reforms have been implemented in recent years that have either created a SAI or enhanced its powers and independence so as to ensure that public spending and revenue raising are in accordance with budget provision, financial regulations, and overall sound financial practices. The aim, of course, is to bring to light

non-compliance, waste, corruption and other irregularities.^[13] Linked to this has been the promotion by international organizations, such as the IMF, World Bank, and Asian Development Bank (ADB), of higher standards of government auditing within Southeast Asian countries, so that they are on par with internationally acceptable standards.

The creation or strengthening of SAIs has been one of the consequences of the democratic reforms in certain Southeast Asian states. For example, the 1987 Constitution in the Philippines, under Section 2(2), gave the SAI, the Commission on Audit, a full remit to ensure 'the prevention and disallowance of irregular, unnecessary, excessive, extravagant, and unconscionable expenditures or use of government funds.'^[3] In Cambodia, a new SAI has been created under the *Law on Audit* passed in 2000, known as the National Audit Authority. It reports to both houses of the legislature, viz., the National Assembly and the Senate, within 9 months after the financial year, and its role is to expose any irregularity in budget implementation and in the management and accounting of public moneys and assets. The Authority began work in auditing the implementation of the national budget in 2002.^[5,11,12] According to the ADB, the *Law on Audit* and the creation of the National Audit Authority improved the situation immeasurably with regard to the government audit function in Cambodia.^[10]

Even in countries where democratic reform has not taken place, improvements in auditing of public accounts can be observed. Although at the apex of a one-party state and without the necessity to be democratically accountable, the Government of Laos (with the help of the ADB) has initiated reforms in the independent auditing of public accounts, especially by the setting up of a SAI, the National Audit Office, to conduct audits of line ministries, provincial authorities, and capital projects.^[2,12,20]

In addition, in four countries (the Philippines, Indonesia, Cambodia, and Thailand), the establishment of a more open and democratic form of government has enabled the legislature to exercise greater independence in the scrutiny of the budget estimates and end-of-year results.^[9,21,22] This has been done through more extensive debates on budget appropriations and tax legislation and through the work of relevant committees in the legislature. In the Philippine legislature, independent reviews of budget implementation and state financial management are conducted by the Congress Appropriations Committee and the Senate Finance Committee on the basis of the findings of the Commission on Audit. Such independent scrutiny was hardly possible prior to the introduction of democracy in 1986.^[3]

Accountability in budget management also depends on measures to combat corruption. In most countries

of Southeast Asia (Singapore being a notable exception), bribery and misappropriation have long undermined the ability of governments to achieve their budget goals and spend money for the purposes intended.^[23] However, steps have been taken in some countries to set up at least the legal and institutional framework to tackle corruption. For example, in Thailand, under the 1997 Constitution, the National Counter Corruption Commission was established. Its powers and ethical standards are spelt out in the National Counter Corruption Commission Act of 1999. The reach of the Commission includes the power to investigate the authenticity of disclosures of personal and family assets and liabilities, which senior public officials are required to make. It can also arrest officials suspected of corruption, and if it is proven to impeach them and confiscate their assets. Another part of its mandate is to identify and prevent conflicts of interest at senior levels of government.^[12,24] However, the Commission still lacks the resources and manpower to conduct detailed enquiries and bring to book those who have abused their office. In so far as it is a branch of the Prime Minister's Office, it may also lack the independence to pursue corrupt officials, where exposure could be politically damaging.^[12]

It may be argued that combating corruption also depends on more transparent systems of information disclosure, and the exposure of financial irregularities by the SAI and committees of the legislature. This is true to a point. However, in the Philippines, despite the transparency and accountability of its budgetary system, high levels of corruption continue. This perhaps attests to the necessity in tackling corruption for a highly specialized anticorruption agency with far-reaching powers and investigative expertise such as that which exists in Singapore but which is lacking in the Philippines.

NEW PUBLIC MANAGEMENT

Budgetary reform in Southeast Asian states, with well-developed budget systems, have in the last few years increasingly reflected the influence of so-called New Public Management (NPM), by which public administration is modeled on business practices.^[25] In the Governments of the Philippines and Malaysia, the influence of NPM is reflected in the shift to accrual accounting and in the use of target setting and performance indicators for public services.^[3,15,26]

However, it is in Singapore, well noted for the effectiveness of its budgetary management, that the imprint of NPM has been most noted. Included in the range of initiatives that the Singapore government have introduced in the last 10 years are linking budgets to performance and results, management autonomy for service

providers, contestability in service provision, accrual accounting, interdepartment charging, point of delivery charging based on cost recovery, and revenue retention by ministries and agencies that levy such charges.^[27,28]

The absence of NPM in its fullest sense in other Southeast Asian countries is not altogether surprising, given the added weight of responsibility, it places upon public organizations in terms of data gathering and analysis, performance monitoring, and professional competencies of middle and junior managers. Only when major advances are made in these areas will it be possible to apply NPM to the budgetary process in these countries.

CONCLUSIONS

In summary, significant budgetary reforms have been introduced in most countries of Southeast Asia in the last 10–15 years. They have focused on improving fund disbursement, decentralizing budget decisions, creating transparency, strengthening accountability, and applying NPM in a few cases. For these purposes, a wide range of laws and regulations have been introduced governing budgetary and financial procedures. Progress in the effective implementation of the reforms has, however, been more variable, and in certain countries impeded by poor organization, lack of training, concerns over the political implications of greater transparency and accountability, and most seriously the continuing prevalence of corruption. If these impediments can be resolved, then budgetary reform will have an even greater impact.

Budgeting and Public Choice

John R. Bartle

Sun Yat-Sen University, Guangzhou, Guangdong, P.R. China*

INTRODUCTION

Public choice theory applies the logic of microeconomics to politics and public affairs and generally assumes rationality and self-interested behavior among citizens and public officials, in the choices they make by and for the public. The persons most closely associated with public choice theory are Buchanan and Tullock.^[1] Buchanan described the genesis of the theory as being a specification of the constitutional and other rules for making choices by and for the public, as well as an investigation of their consequences, in the tradition of the original designers of the U.S. Constitution. Buchanan explained:

Tullock and I considered ourselves to be simply taking the tools of economics, looking at something like the structure of American politics in the way James Madison had envisioned it. That is, it was clearly not a majoritarian democracy, which would be the parliamentary model (which was the ideal, at that time especially, of all the political scientists), rather it was a sort of a constitutional structure. We were the first to start analyzing the Constitution from an economic point of view. There were other people who analyzed particular voting rules, like majority voting, but we put that in a constitutional structure and provided an argument for choices among voting rules. We concentrated on that. So, in a sense, I considered us to be simply writing out in modern economic terms more or less Madison's framework of what he wanted to do, as opposed to anything new and different. It turned out that nobody had looked at it in that way.^[2]

Public choice theory has had an important influence on governments across the world, as several advisors to conservative governments were scholars who helped to develop this perspective or were influenced by it. As a result, it has been a controversial perspective. Public choice theory is relevant to many other areas of public affairs and political science (e.g., voting, international relations, and macroeconomic policy); however, this article focuses on the influence of this perspective on public budgeting theory and practice.

RELEVANCE TO PUBLIC BUDGETING

Public choice theory deals with many topics relevant to public budgeting but, unlike most of the study of government budgeting, takes a deductive theoretical approach to these topics. In public choice theory, budgetary actors are usually assumed to be acting in their self-interest rather than in the interests of their agency or the public. Rather than focusing on “how to” topics that are the main substance of public budgeting texts, public choice looks at the incentive structure within institutions and attempts either to predict outcomes on a solely theoretical level or to compare these predictions with empirical findings. Public choice theory usually does not take the descriptive approach that most budgeting literature does but, rather, seeks to theorize, test, and refine its theories.

Public choice denies the notion that government is a “benevolent despot” that will act to correct market failures and make distributional judgments in an even-handed way. From this perspective, one “ceases to see government as standing apart from the economy adjusting, correcting, and fine-tuning the economy. Rather, one sees it as being thoroughly enmeshed in the economy.”^[3] It is argued that this is a better way to understand why certain government policies exist, such as price controls, price supports, tax preferences, government-sponsored monopoly, and transfers to business and the non-poor.

Despite many differences, public choice and the study of budgeting have much in common. Forrester pointed out that both perspectives have similar interests in the choices that governments make. That is, both focus on the actions of budgetary actors, both have similar definitions of bureaucratic success (the rate of budgetary increase), both accept the value of economical government, and both accept the argument that administration and politics are not separate.^[4]

Early writings in public choice tended to come from the conservative side of the political spectrum and often clashed with mainstream public administration. Many public servants and their teachers had a visceral reaction against public choice writings about “greedy bureaucrats,” the public choice rejection of Wilsonian principles of public administration, and

the rejection of the notion of the “public interest.”^[5] As a result, there was initially a deep rift between the perspectives. However, since then, many public choice theorists have emerged, who are less ideological, and many public administration scholars have come to see some value in public choice models. In particular, because public choice has launched many empirical studies that have carefully tested propositions from public choice theory, as well as public administration, there have been some productive attempts to bridge the gap and to see how the two perspectives can strengthen each other.

GOVERNMENT SUPPLY AND AGENDA MANIPULATION

Perhaps, the best-known public choice model in public administration is Niskanen's model of public good supply.^[6] Niskanen hypothesized that agency heads will seek to maximize their budget. In doing so, they are constrained by the fact that they must deliver a certain level of services to their political sponsor. A conflict arises where the sponsor, unlike the agency head, is unable to observe the “production process,” whereby inputs are turned into outputs. All sponsors know is that for x dollars, y output is produced. A self-interested agency head, Niskanen argued, would exploit this information advantage and supply more output than demanded. This, in turn, increases the agency's budget, which is in the interests of the agency head, but not those of the sponsor (nor, presumably, the public). This is wasteful because the level of output provided is higher than the efficient level, so that marginal social costs are greater than marginal social benefits. The agency head in a sense is empire building, by controlling the information the political sponsor receives. In a later piece, Niskanen modified his model to assume that agency heads maximize their utility, rather than their budget, and that utility is based on the discretionary budget and the output of their bureau.^[7] This adds another possible outcome that the output level is efficient but that it is done inefficiently.

Niskanen's model generated a vast array of work, either testing his hypotheses or questioning the logic of his model. For the more practical purposes of public budgeting, it has had three important contributions. First, it was the first explicit model of government supply, which enabled a more complete modeling of public goods demand and production. Second, it demonstrated the importance of agenda control. For instance, in some cases, budgets have to be approved by referendum rather than by a vote of the elective body. Theories such as Niskanen's can be developed and tested to see if budgetary outcomes are different when the process of approval is different. Third, it was one contribution that helped to provide a theoretical

justification for the move to limit government size. In the political arena, this contributed to the success of many of the tax and spending restrictions in U.S. states, and also in the central governments of the United States during the Reagan Administration and the United Kingdom during the Thatcher administration. Indeed, Niskanen himself was on Reagan's Council of Economic Advisors.

CONSTITUTIONALISM

Along with Niskanen, the work of Buchanan and his coauthors provided the intellectual foundation of the movement to increase the constitutional restrictions on government fiscal practice. This work is of fundamental importance to understanding movements, such as Proposition 13 in California, and similar limitations on democratic governments. Brennan and Buchanan made the standard economic assumptions about humans—that they are rational and self-interested—and asked what constitutional arrangement an actor will agree to before the establishment of the government.^[8]

Brennan and Buchanan argued that people will fear that any majority will act as a tyrant and use the coercive powers of the state to fund inefficient projects to the benefit of the majority or, simply, to use the tax and transfer system to effectively steal from the minority. Although the actor might be able to be part of the majority and therefore benefit from this redistribution, they might not, and, if they are risk averse, they will choose a safer arrangement. Because of this concern, they argued that the rational actor choosing the fiscal rules of the constitution will limit both the constitutional procedures for considering policy and the allowable range of fiscal outcomes to limit the revenue-raising potential of the state. These limitations form the basis for a fiscal constitution that may narrowly constrain the actions of the government. The constitutional procedures they suggest are supermajority votes, multiple levels of approval, clearly defined property rights with application of due process in the protection of property, uniformity in taxation, and constitutional restrictions to balance the budget. The fiscal outcome restrictions suggested are limitations on tax rates, constraints on the breadth of tax bases, earmarking of revenues for specific expenditures, and restrictions on debt issuance and money creation.

Some of these constraints have been in place since the Magna Carta or the founding of the U.S. republic, whereas others are hotly debated topics in seats of government throughout the world. If nothing else, this public choice model forces us to rethink the fiscal rules of the game for any government. Not only is Buchanan's perspective relevant in these important

current debates, but it also challenges the fundamental approach of contemporary public finance analysis and many of its most basic policy recommendations. For example, it is typically recommended that, in order to serve the goals of pro-efficiency and pro-equity, tax bases should be broad, with few “loopholes.” This public choice perspective argues the opposite, as broad tax bases only make it easier for government to increase its revenue. In the words of Stevens, rather than assuming that the state is a “good fairy,” this approach sees the state as the “wicked witch,” seeking to increase its power, with little regard for the welfare of the citizens.^[9] Although this approach rubs many public administration scholars the wrong way, it is congruent with the views of some American citizens, and probably a roughly accurate description of the practices of some despotic governments, both in the history and in the current day.

SIZE AND GROWTH OF GOVERNMENT

Since the early 1900s, government has grown in most nations, and sometimes at a high rate. What explains this? Several theories have been examined. In 1977, Buchanan looked at two views of government—“government by the people” and “government against the people”—and summarized the findings at that time.^[10] The first model, a benign theory of the state, hypothesized that this growth was attributable to factors such as population growth, urbanization, the growth of the service economy, the income elasticity of demand for public goods, and Baumol’s “productivity paradox.” He wrote that one-half to two-thirds of the growth in government could be attributed to these factors. The unexplained gap suggested that a more pernicious model of government may explain the trends. His “government against the people” view suggested that other factors might explain part of this growth: the voting of bureaucrats for larger government; the profit-seeking activities of elected officials; and “fiscal illusion,” the phenomenon that the full cost of government services is hidden or not understood by voters. Buchanan concluded that the motivational structure of government is probably the cause of this unexplained growth in government.

Later, Mueller reviewed several research articles speaking to this question. The range of factors is suggestive of the breadth of scholarship in this area. They include both good and bad reasons for government growth, specifically urbanization, income growth, the price elasticity of demand of public goods, the expansion of suffrage over time, changes in the distribution of income, voting of public employees and welfare recipients, interest groups, bureaucracy, and fiscal illusion. While it is difficult to generalize, Mueller

concludes, “all of the institutions of democracy—electoral rules, institutions of direct democracy, and federalist institutions—seem to be important in determining the size of government. These institutions differ across countries, and their efficacy changes over time as the economic and political environment of a country change.”^[11]

Some public choice theorists have concluded from this research that there is a good case for fiscal limitations of the sort that Buchanan suggested. These limitations may be constitutional, procedural, or statutory limits on government growth or tax rates. Recent reforms in the United States such as a proposed constitutional amendment to require a balanced federal budget; the statutory budget rules passed by Congress in the 1980s and 1990s; state tax, expenditure, and debt limits on local governments; and state restrictions on local revenue sources, in part, speak to these concerns. Although the connection between these institutional rules and the size and growth of government is not always as clear and direct as proponents may argue, these institutional changes have been an important part of recent conservative political reforms.

RENT SEEKING

Economic rents are surpluses that cannot be competed away, for example, the return from an asset that is unique and in high demand, such as a parcel of property with a favorable location. Rent seeking is “attempting to use the political process to allow a firm or group of firms to earn economic rents in excess of their opportunity costs,” or one firm or a group of firms acting to obtain special treatment by the government at the expense of others.^[12] Although firms might compete in the economic market for sales and profits, they may also compete in the political market for restrictions that enable them to receive rents. They might do so in legal ways, such as lobbying or campaign contributions, or illegal ways, such as bribery, intimidation, or kickbacks. There are numerous examples of market restrictions that might lead to rents: regulatory protection, patents, zoning, exclusive licenses, occupational licensing, and academic tenure. Not only might these uncompetitive practices lead to economic inefficiencies, but also the competition among businesses and individuals for these rights would be wasteful. A casual look at lobbying practices in most governments suggests that this phenomenon is an issue. Evidence from research on campaign contributions is supportive of this assertion.^[13]

Government budgets are susceptible to rent-seeking behavior, on the part of officials and interest groups. Constitutional economists would urge that the scope of action allowed to the state should be restricted,

so there will be little opportunity to extract rent by use of the apparatus of government. This might be done through requiring supermajorities for passage of such legislation or, simply, by abolition of regulatory bodies that might be prone to this behavior. Others who may not be true believers in public choice theory might agree for the need for structural defenses of the public treasury against rent seekers. Many public administration scholars suggest that a strong code of ethics can accomplish the same result. It is hard to generalize about which solution is best, but it is worth noting that both the public choice and the public administration approaches to the study of government recognize this problem.

CONCLUSION

Public choice theory has had an important influence on both practice and thinking about government budgets. Its validity in explaining behavior within agencies and patterns of change in the public sector is open to question; however, public choice advocates are energetic examiners of their theoretical speculations, so inquiry in this area continues to advance the ideas. Public choice has generally been seen in opposition to orthodox public administration, although, as Forrester pointed out, this need not be. In fact, the public choice view of government sees numerous actors with varying motives, in competition with each other, some scrupulous and some not. This is more congruent with what we know about politics than the "benevolent despot" view of the state. Both for polemic and for scholarly reasons, practitioners and scholars in public administration need to understand public choice theory and follow its development.

Budgeting, Line-Item and Object-of-Expenditure Controls

Suzanne Leland

*Department of Political Science, University of North Carolina at Charlotte,
Charlotte, North Carolina, U.S.A.*

INTRODUCTION

A line item budget is a traditional budget format that uses object classifications by broad categories to present proposed expenditures. Primarily used for the purpose of financial control, the categories in a line item budget consist of lists of expenditures that are logical, and contain items such as personnel, travel, equipment, or supplies. A line item budget provides simple, but limited information beyond the cost of specific categories of expenditures or appropriations in order to ensure accuracy and control. In a household budget, an example of a line item would be the amount of household income spent on clothing, but the list of expenditures would not detail the particular items purchased for each family member.

LINE ITEM BUDGET FORMATS

When governments solely rely on the line item format, the budgetary process is said to be best characterized as “incremental” because it typically calls for the last completed fiscal year, the current year, and the forthcoming fiscal year, including funds, organizational units, and objects of expenditure.^[1] Although budget battles appear to be controversial matters, the outcome is seldom a little more than the prior year’s budget using this process. This often leads to the gradual increase in expenditures, and can lead to mounting debt and deficits overtime. Despite criticisms of the incremental nature of budgeting via the line item process, this method of budgeting does provide a sense of stability from year to year. The stability of the line item budgetary process is valued by lawmakers and administrators because they often rely on budgetary projections for political decision making.^[2]

According to Wildavsky’s theory of incrementalism, budgetary decision making is driven by department heads.^[1] Therefore, each year only the increments from an already existing and well-defined base are examined by policy makers. From this point of view, governmental budgeting is considered to be an annual repeated process that results in the bargaining between individuals who know one another through budgetary activities. This theory most adequately describes what

happens when a government uses a line item budget, but does not accurately describe other methods of budgeting used in government. For example, the theory of incrementalism could not take into account or explain entitlement programs such as social security, which over time squeezed out other categories of expenditures in the federal budget. Nor could Wildavsky’s theory of incrementalism account for top-down budgeting processes when bureaus and departments were bypassed or when cutbacks took place.^[3]

OBJECT OF EXPENDITURES

Technically, a budget following a line item format is a detailed financial plan developed according to governmental accounting based on object of expenditure classifications. Objects of expenditures (or objects of expense) are detailed categories of goods and services that are purchased by an organization, such as supplies, travel, equipment, or personnel services. Each object-of-expenditure classification is a form of accounting that attempts to limit expenditures by the organization. Normally, objects of expenditures are divided by departments or divisions within the organization that serve as appropriation guides to personnel.

USE OF LINE ITEM BUDGETS

The line item budget format is especially useful for purposes of financial control and is the simplest budget format to link to governmental accounting systems. The format of a line item budget is straightforward, readable to citizens, and can easily be converted to accounting systems. For these reasons, this form of budgeting is now common across public and non-profit organizations in the United States.

The first widespread use line item budget in the United States came about as part of the reform movement that was aimed at cleaning up municipal corruption in the early part of the twentieth century and the move to make government more efficient like business. The focus of the reform movement was on gaining financial control, and the budget reform preferred was the line item format.^[4]

For local governments, line item budgeting is closely associated with the introduction of city manager forms of government. The reformers at this point in time were keen on introducing “efficiency” measures into government administration, and accountability to the public for how and why taxes were spent.^[4]

Due to the advantages of the line item format, approximately 51% of U.S. local governments still use some form of line item budgets.^[5] Governments can incorporate the line item budgeting format in one of two ways. First, a government may use the line item format primarily to present their budgets to elected officials and the public. Second, and more common, the local government uses this format as a supporting document or to supplement to another format. Typically, in the case of the latter, the more comprehensive the budget format, the more varied and numerous the formats and systems for classifying data.

At the federal level, line item budgeting is associated with the first wave of budget reforms in the United States. The move to centralize the federal budgeting process was culminated in the passage of the Budget and Accounting Act of 1921. This law established the Bureau of the Budget (BOB) as the central agency in charge of the federal budgetary process. Along with the BOB, the act created the congressional Governmental Accounting Office to scrutinize federal expenditures. Gradually, after the passage of this act through the 1930s, the federal budgetary process became more detailed. Categories were narrowly defined so that expenditures were attached to line items to link expenditures to specific programs.

It is important to note that while line item budgets do not preclude planning or the aim of achieving objectives, they are primarily concerned with controlling and confirming the budgetary process to set aggregate spending limits. A well-designed budget format should provide a general statement of financial status, inform stakeholders of the cost of achieving agency goals, simplify operational procedures with well-classified expenditures, and serve as a means to evaluate objectives. The traditional line item format alone does not adequately meet these requirements and works best when used by governments in a supplemental manner to other budgetary formats such as performance-based budgeting.

Budgeting, Performance-Based

Julia E. Melkers

*College of Urban Planning and Public Affairs, University of Illinois at Chicago,
Chicago, Illinois, U.S.A.*

INTRODUCTION

Using performance data in the budgetary process means integrating information about outcomes and impacts in decisions about the allocation of funds where the goal is to be able to allocate financial resources using performance information to make a more informed decision. Performance measures are generally established at the agency level, oftentimes with input from executive and legislative budget offices. Ideally, performance measures are developed for both internal use by agency staff as well as use for external reporting, including use in the budget process. Improved accountability is the primary rationale for the push to performance-based budgeting at all levels of government. An important thrust of current budget reform efforts is to develop structures that improve communication both within and between government and citizens. This activity is referred to as performance-based budgeting (PBB).

OVERVIEW

Simply put, PBB is a recently revived phenomena in budget reform that involves the integration of performance measures and data representing agency activities in the budget decision-making process. Although it seems innate that aspects of performance will be included in decisions about the allocation of resources, this is often not the case. In recent years, however, governments and non-profit organizations are moving away from a line item approach and adopting performance budgets, where a link is established between allocated funds and what an organization will achieve with those funds. Line item budgets encourage decision-making processes that focus on individual items in a short-term framework with little or no explanatory information. Performance budgeting efforts take a broader approach, encouraging a long-term perspective with an emphasis on what will be achieved in the future.^[1]

TERMINOLOGY

With the trend toward the use of performance measures in budgetary processes, PBB has become increasingly

popular in this era of budget reform and government reinvention. However, what may be described as PBB, is actually a more diverse set of requirements, blending various aspects of current public management trends, including outcome measurement, performance measurement systems, strategic planning, and benchmarking. Although PBB may be the most common term to refer to this process, the actual terminology varies a great deal as organizations and governments design the process and “make it their own.” In fact, these variations are reflected in the performance-based requirements used in different governments and organizations. Some state and local governments refer explicitly to PBB, “performance-budgeting,” “results-based budgeting,” or “outcome-based budgeting system.” Others, however, are more descriptive, indicating that certain performance-related elements be included in the budgetary process. Here, they may use terms such as “program performance reports,” “performance measures,” “outcome measures,” and “performance standards and measures.” These differences, however, are simply a matter of language. The essence of these different requirements does not vary—each indicates that performance measures be actively incorporated in the budgetary process. Specifically, these performance budgeting initiatives involve:

- Identification of broad performance measures for selected organizations (programs/departments/agencies), with an emphasis on outcomes.
- Linking of outcome measures to organizational activities and their respective budgets.
- Targeting performance levels and budget levels together.

LEGISLATIVE AND ADMINISTRATIVE REQUIREMENTS

The use of performance data in budget processes and budget decision making is increasingly becoming the norm in public and non-profit organizations. Governments are not only *encouraging*, but *requiring* the integration of performance data in the budgetary process. In 1993, the Government Performance and Results Act (GPRA) was passed, requiring the establishment and use of performance measures in federal agencies.

One of the stated purposes of the act is to “improve congressional decision-making by providing more objective information on achieving statutory objectives, and on the relative effectiveness and efficiency of Federal programs and spending.” More specifically, as noted in Section 1115 of the act, the role of performance measures in the budget process are stated as follows:

In carrying out the provisions of section 1105(a)(29), the Director of the Office of Management and Budget shall require each agency to prepare an annual performance plan covering each program activity set forth in the budget of such agency. Such plan shall—

1. establish performance goals to define the level of performance to be achieved by a program activity;
2. express such goals in an objective, quantifiable, and measurable form unless authorized to be in an alternative form under subsection (b);
3. briefly describe the operational processes, skills and technology, and the human, capital, information, or other resources required to meet the performance goals;
4. establish performance indicators to be used in measuring or assessing the relevant outputs, service levels, and outcomes of each program activity;
5. provide a basis for comparing actual program results with the established performance goals; and
6. describe the means to be used to verify and validate measured values.

The tone set by the GPRA is reflected in many similar state and local PBB requirements. At the state level, all but three states (*Arkansas, Massachusetts, and New York*) have legislative or administrative requirements for the integration of performance data in the budget process, with most of these requirements established in the 1990s (Melkers and Willoughby, 1998).^[5] One state (Missouri) established PBB by executive order. States that are best known for the development and use of performance measures in the budget process include Texas, Oregon, Minnesota, and Florida. A similar trend toward the use of performance measurement information in the budget process is taking place in local governments, with many municipal and county governments requiring performance measurement with an intent to use it in the budgetary process.

In earlier budget reforms, integrating performance information in the budget process was viewed as a linear process. Research shows, however, that decision makers consider a range of factors in budgetary decisions.^[2,3] Today's reform, however, acknowledges the complexity of not only public programs, but also

of the budget process itself.^[4,5] For example, in the state of Washington, the budget guidelines are clear that performance data inform, but do not drive, budgetary decision making. Instead, the actual budget or policy decision involves performance measures, but is also affected by a variety of other factors, such as financial realities, stakeholder requirements, competing priorities, public sentiment, organizational capacity, and public sentiment.

SELECTING APPROPRIATE PERFORMANCE MEASURES FOR THE BUDGET PROCESS

The Government Finance Officers Association (GFOA) recommends a useful list of characteristics for performance measures that are used in budgetary processes. They suggest that financial, service, and program performance measures be developed and used as an important component of decision making and incorporated into governmental budgeting. Specifically, they state that performance measures should:^[6]

- Be based on program goals and objectives that tie to a statement of program mission or purpose.
- Measure program results or accomplishments.
- Provide for comparisons over time.
- Measure efficiency and effectiveness.
- Be reliable, verifiable, and understandable.
- Be reported internally and externally.
- Be monitored and used in decision-making processes.
- Be limited to a number and degree of complexity that can provide an efficient and meaningful way to assess the effectiveness and efficiency of key programs.

In an ideal performance budgeting process, output measures are included to show the level of work accomplished, but efficiency and effectiveness measures are most relevant and may be most informative in the budgeting process where decision makers are looking for links to actual funds. Taking output, outcome, and efficiency measures together gives policy makers a full view of activities completed, the cost and value of the outputs and outcomes, and what has actually been accomplished with the actual expenditures. In the current state of government reform, helping government to become more efficient is an important focus. In this same vein, as performance measures are introduced in the budgetary process, they are important for identifying the relative efficiency of services. Efficiency measures are important in the budget process because they help to answer the question, “How much output is there for a given input?” This type of information is especially important in making

fiscal decisions because they provide information on the cost of providing services and when linked to output measures, provide information on the cost of obtaining given outputs.

The rationale behind performance budgeting processes is that better resource allocation decisions will occur with the use of information that indicates how well an entity is performing. For many governments, this performance is linked to agency or program goals and objectives. Therefore, performance budgeting should indicate how well an agency or program is meeting those goals and objectives. It is imperative that performance measures in the budgeting processes are not limited to measures of outputs, but that include actual outcomes.

Although it seems straightforward to select certain categories of measures most useful for budgetary decision making, it is not a uncomplicated process. Along with challenges relating to the identification and selection of performance measures, there are three important challenges in the selection of measures for budget processes:

- Nature of the budget cycle.
- Perspective and attention span of policy makers.
- Pressure to demonstrate macroresults.

Typically, most budget cycles are on an annual basis, with some governments adopting a biennial budget. Because of this relatively short time frame, integrating performance measures in budget process means selecting measures that can show some change within that timeframe. Measures cannot be so global to not be meaningful within the budgetary calendar. One problem with measuring outcomes within the budgeting cycle is that the outcomes of most government and non-profit programs and services occur in a much longer timeframe. This is perhaps the greatest challenge in integrating performance measures in the budgetary process. Because of this challenge, it is important to identify interim or intermediate outcomes that show progress toward or a contribution to the ultimate projected outcome. In addition, performance targets or goals may also be shown to provide a context for the performance information.

Another important challenge is that policy makers and others involved in the budget process typically have to review budgets and measures for numerous programs and departments. Further, these individuals will have varying levels of familiarity with the individual budgetary entities. For this reason, it is important to include only key measures in the budget process. More detailed measures are more appropriate for the departmental level. For example, in Florida, the guidelines for their performance budgeting initiative, PB² (performance-based program budgeting), note

that measures of broad program results appear in the budget documents, while detailed output and outcome measures are maintained and used at the agency level. Similarly, in Washington State, the guidelines stress that key, summary measures appear in the budget documents, but must also link to the agency strategic plan. Further, they note that the focus should be on developing a core set of useful and verifiable indicators, rather than on a large quantity of indicators.

In addition, there may be pressure from policy makers to identify measures that reflect macrolevel policy goals in a government, such as “lower infant mortality rate” or “healthier society.” However, it is important that performance measures in the budget should be tied to activities and results that the agency can affect. It is important then that interim measures be selected that show progress toward those larger policy goals where performance may be linked to agency strategy and goals.

As performance measures are integrated in the budget process, guidelines for their selection, reporting format, and use are important to ensure consistency across government, but also to inform stakeholders about the changes and related requirements associated with the new process. In some cases, such as in the state of Florida, there are elaborate review procedures of the measures themselves to ensure consistency and quality of measures across agencies. In most cases where performance measures are required in the budget process, general guidelines are provided indicating the types of measures that are to be included.

IMPLEMENTING PERFORMANCE BUDGETING

Implementing performance budgeting means changing the way that agencies submit budget requests as well as changing the way that policy makers make decisions.^[7] The formalization of PBB requirements provides a framework or process so that performance data are considered in the budgetary process. For many systems, this requires a complex reworking of existing processes.

Because most governments have not been collecting performance data as a regular activity, implementing performance budgeting means not only refining the budget process, but also developing a parallel or concurrent process where performance measures are identified, and data collected and reported to fit with the existing budget cycle. Thus, implementing performance budgeting often means initiating performance measurement activities in the first place. Many governments that have adopted performance budgeting processes have done so in a multistage process, where different programs or agencies are selected to pilot the use of performance measures in the budget process

before the process is implemented governmentwide.^[5] Adopting a performance budgeting system in this way is important because it allows for learning, adaptation, and integration with existing systems. For example, the state of Florida implemented its PB² initiative over several years, adding new departments and programs each budget cycle. An important advantage of a pilot process is that, as new agencies or departments or programs begin performance budgeting, they are able to look at and communicate with other entities within their government as examples.

An important fiscal issue arises in this implementation process. If performance measures are meant to be used in budgetary decision making, what happens when programs or agencies do not meet their targets? For state governments, a handful provide explicit guidelines for actual agency attainment, or non-attainment of goals and objectives as part of their legislated performance budgeting requirements. These are guidelines that offer rewards to public managers to strive for and attain the performance goals that they have identified in their strategic planning or other process. Research has summarized and compiled the different variations that guidelines have taken in the states.^[8,9]

CONCLUSION

Overall, there is little evidence to show that performance data are affecting actual budget appropriations. This is not surprising or disturbing because the implementation of performance budgeting is still in the early phases for many governments. However, integrating performance data in the budget process can help decision makers to make better, more informed decisions along the way.^[10] Specifically, performance data are useful for helping decision makers in a number of areas:

- Understanding the activities and objectives of funded programs by viewing summary measures of performance.

- Understanding changes in performance over time compared with budgetary changes.
- Having more meaningful dialogs with public managers about agency activities, goals, and performance.
- Identifying poorly performing and high-performing programs and departments.
- Justifying fiscal decisions using evidence rather than anecdotes or impressions.

Budgeting, Target-Based

B. J. Reed

*College of Public Affairs and Community Service, University of Nebraska,
Omaha, Nebraska, U.S.A.*

INTRODUCTION

Target-based budgeting (TBB) has become an increasingly common approach to the budgeting, particularly for local governments. It is a method of budgeting that identifies overall expenditures for an agency or unit based on the estimated revenue available to government. It allows control to be imposed at the executive or legislative levels while allowing decentralization and flexibility at lower levels of the organization. TBB is particularly useful when state and local governments have needs to control spending but also face turbulent and unpredictable demands for services.

WHAT IS TBB?

In most cases, the expenditure “target” for each unit of the organization under TBB is determined by the budgeting or finance office under the direction of the chief administrative officer and the policy board for that organization. This target is based on the strategic priorities or direction of the agency as well as the estimated availability of revenue.^[1] These expenditure ceilings are set well in advance of departments preparing their budgets and are not negotiable. Usually, a percentage of the total budget is set aside for contingencies as well as for discretionary spending. The discretionary spending allows for organizationwide priorities and may include departmental requests beyond those funded within the targets set for each unit.

Targets can be set a few different ways. One is to simply divide proportionately historical expenditures by department. For example, if public safety historically has taken 35% of a city’s expenditures, their target would be 35% of the revenue available after contingencies, discretionary allocations, and one-time expenditures have been determined. Rubin referred to this as the “constant services or maintenance of effort budget.”^[2] Another approach would be to combine historical spending patterns with strategic priorities of the government. If the elected officials determined that neighborhood development was to become a key focus for the city, targets for departments involved in neighborhood development could be adjusted upward.

However, in most cases, such strategic emphases would be included within the discretionary portion of the budget rather than in adjusting the targets for each agency.

Target budgeting is designed to centralize overall expenditure patterns among departments, while maximizing discretion within each agency about how to spend those dollars. Although some service deliveries within departments are mandated by law, other activities are discretionary. Units can determine within the target provided what they believe to be the most important, and what personnel and operating expenditures are necessary to carry out these services and activities.

If the target provided is above the historical dollars provided to the agency, discretion increases. However, if targets are at or below previous targets, discretion is reduced. Departments with high mandated activities may be at a competitive disadvantage relative to units with fewer mandated service levels. County health departments may be mandated by the state to carry out inspections of restaurants, so some expenditures will have to be dedicated to this activity within the target set by the county commissioners. Similarly, departments with access to external funding through fees, grants, or donations may be able to shift expenditures covered by such revenue sources rather than having them covered by tax-based revenue set as part of the budget process. Also, because some tax revenue is earmarked for particular purposes, some departmental targets may be adjusted to reflect trends in revenue generation in these areas. County road departments may have revenue generated through gasoline taxes because such revenue has to be used for the construction or reconstruction of roads, while county health departments may receive revenue generated through inspection fees. Such earmarking must be taken into consideration as the chief executive and budget office develop targets for each department.

Linking targets to revenue forecasts is a tricky business, but is essential to making TBB work. Revenue forecasts must be set early enough to ensure time for target expenditures to be set and departmental responses to be developed. Forecasting property tax receipts may be quite easy because past patterns are good predictors of future revenue. Predicting sales

or income tax is much more difficult because they are based on underlying economic conditions and consumer confidence rather than on mandatory fee payments. White suggested that forecasts be set at least 6 to 8 months in advance.^[1]

Target-based budgeting is different from lump sum budgeting (LSB), which assumes no line item discipline within the agency or departmental budget. It also does not necessarily involve setting target ceilings for expenditures based on forecasted revenue. Target-based budgeting can be combined with LSB to create only a ceiling on expenditures. In this case the department has total discretion to shift funds between personnel and operating line items as long as they remain within the target ceiling. Target-based budgeting can also be linked to specific line items. In such cases, permission would be required for shifts among personnel or operating categories once the target budget has been established.

Target-based budgeting is also different from zero base budgeting (ZBB), which requires extensive development of budget scenarios within each department through the development of “packages” of services and the costs associated with each of those packages. Target-based budgeting is much less paper and time intensive because it only requires departments to provide overall requests as they might typically do in more traditional budget processes as long as they do not exceed the ceiling.

The amount set aside for contingencies or discretionary spending is determined by the chief administrator and the policy board, and is likely to range from 10% to 15% of the overall revenue projected for the agency. Agencies can also pass down the contingency estimates to each individual department but this will require targets to be adjusted for expenditure predictability. Public works departments, for example, may require greater contingencies for such things as salt, sand, and overtime due to inclement weather than would be true in a department such as human resources or planning. The amount set aside for discretionary spending increases the ability of policy

boards to set priorities but it also decreases the flexibility and discretion at the unit level. Policy makers must be willing to allow 85% to 90% of the budget to be decentralized to individual units. However, the remaining 10% to 15% can be ranked to meet overall organizational priorities. Table 1 provides an example developed by Wenz and Nolan about how the process would work.^[3]

HISTORY AND USE

According to Rubin,^[4] the first mention of TBB was a case study of Berkeley, California, in the 1920s. Although the exact term was not used, the process used in Berkeley was similar to what we think of as target budgeting. In this case, each department was provided a “maximum amount” to spend during the fiscal year, while providing supplemental requests in priority order to the city manager.

Some form of TBB has been practiced since the 1920s. The emergence of ZBB in the 1970s in Georgia, and later at the federal level, provided a new twist on target budgeting. However, the enormous complexity and paper work requirements of ZBB made it fall from favor even when TBB was continuing to be used throughout the United States.

As noted earlier, most documented uses of TBB have been in city and county governments. Cincinnati, Tampa, Rochester, Phoenix, Salina, Kansas, and Douglas County, Nebraska, have all used the target budgeting approach. In Cincinnati, the city council developed decision criteria to allocate discretionary funds centrally once the target budgets had been established. The criteria included such things as maintenance of the city’s infrastructure, legal mandates, agency capacity, employment potential for the private sector, environmental impact, preventive maintenance, and support for long-range plans.^[5]

Rochester developed a target for each unit, but subtracted all one-time costs that occurred in the previous fiscal year and the addition of new one-time costs for

Table 1 Calculation of targets

Total operating fund budget	\$151,840,000
Recreation department budget	7,956,740
Proportion of total operating fund budget	$(7,956,740)/(151,840,000) = 0.0524$
Total projected operating fund budget resources	153,850,000
Less 10% discretionary reserve	15,340,000
Net projected total operating fund resources ^a	138,510,000
Recreation department target	$0.0524 \times \$138,510,000 = \$7,258,200$

^aThe projected \$138 million did not involve certain expenses, such as fringe benefits, that were not included in the target.

(Source: From Ref.^[3].)

the coming fiscal year. Phoenix along with many of the other cities used some form of performance measures either at the unit level or individual level in conjunction with TBB. Outcome measurement is seen as an important linkage to target budgeting.^[6] Salina, Kansas, closely tied its TBB efforts to strategic planning with the city council developing performance goals that help to direct strategic priorities for the city.^[11]

STRENGTHS

Target-based budgeting has several benefits. First, target budgeting can be carried out without extensive burdens on departments. It requires some analysis, but not the extensive kinds of detail that other budget approaches require. Second, it can provide constructive policy involvement by elected officials, but leave considerable discretion to unit managers. The target budgeting approach allows prioritization of a percentage of the budget at the policy level, while delegating decisions for most of the funding to the unit level. This mix of centralized and decentralized decision making often creates a healthy balance in the budget process. Third, by having the targets set by revenue estimates, TBB avoids much of the expenditure haggling that occurs with other budget approaches. Departments know the parameters they will be working within and this predictability can improve management decisions throughout the fiscal year. Finally, the ability to identify discretionary funds that can be used to reallocate toward priorities of the organization allows chief executives and policy boards the ability to have substantial affects on meeting agency goals.

WEAKNESSES

Target-based budgeting must have the total support of the policy board and the chief executive. Pressure will exist to vary the targets set, and it is likely that some departments will attempt to manipulate the process in other ways. Only strong support by organizational decision makers will make the process work. Conversely, government officials must avoid the temptation to micromanage decisions made at the departmental level. The true incentive for unit managers is the discretion to control budgetary allocations. Target budgeting without such discretion ties the hands of managers, and reduces support and incentives to innovate and produce efficiencies that benefit the entire organization.

Revenue projections must be as accurate as possible. The whole basis of TBB is that ceilings are set based on proportionate allocation of known revenue. Inaccurate forecasting can undermine the entire approach.

Although improvements can result with TBB, the process is still likely to be an incremental one. To some extent, this is determined by how the discretionary dollars are allocated across the agency. Placing substantial portions of the revenue into new initiatives can result in substantial changes. This is not common. If the culture is developed where innovation is supported, non-incremental change may be possible at all levels of the organization. However, TBB does not guarantee that such chance will occur.

Target-based budgeting works well with general fund tax dollars. It does not work as well with departments that generate substantial dollars externally through fees or external grants or donations. Public utilities are not good candidates for TBB because most of their resources are based on customer payments. In this case, these units operate through self-funded activities. Another complexity of TBB is sorting through tax revenues that are earmarked for particular activities within departments. Public works departments who receive earmarked funding of gasoline or cigarette taxes rely on different allocation and forecasting processes than those departments that depend exclusively on property, sales, or income taxes.

CASE STUDY OF TBB

The University of Nebraska (NU) system operates under a modified target budgeting approach. As a result of a state Supreme Court decision, the Nebraska Unicameral Legislature (NUL) is required to provide NU with funding in a "lump sum" based on revenue forecasts without the ability to earmark funding for specific purposes. The University of Nebraska submits line item detail to NUL in the late summer or early fall of each year. Nebraska Unicameral Legislature approves the budget in May or early June and, based on revenue forecasts, developed by a state forecasting board. The governor can approve the recommendations of NUL or line item veto elements that are oppositional. Nebraska Unicameral Legislature can then sustain or override the governor's vetoes. Once approved, the university has total discretion in how those tax dollars are spent beginning July 1 of each year.

Once NUL and the governor have acted, the elected Board of Regents in conjunction with the president of NU allocates target lump sum budgets to each of the four campuses of the system. Certain campuswide expenditure priorities are identified by the top administrators of each campus and funding is set aside for these priorities. At The University of Nebraska at Omaha, however, the vast majority of funding is allocated in the form of "target" amount to each unit on the campus. Certain assumptions are built into these target allocations. These are initial established as NU

prepares its budget for submission to the state and are revised based on final action taken. Estimates are made for personnel and operating based on existing lines and previous state-funded operating expenditures. Any increases in personnel costs or fringe benefits are added to the targeted amount for each unit.

Once this target budget is established, unit directors have complete discretion in shifting dollars between established personnel and operating line items as long as they remain within the overall budget target established at the beginning of each fiscal year. In reality, the amount of discretion is a function of changes in personnel status within the unit. If all personnel lines are filled, discretion becomes almost non-existent because most assumptions concerning operating budgets are considerably below actual need. However, if personnel lines are open and remain unfilled, discretion increases substantially.

Each unit is charged a "tax" by NU, based on legislative assumptions about the number of open lines that will exist within each campus and unit each year. These charges are passed down to each unit in proportion to their overall personnel budget, irrespective of the number or dollars associated with actual open positions. In some cases, these charges can be offset during the fiscal year by allocations made centrally for such things as equipment requests, funding for part-time instructors, and so forth. However, the allocation of such funds remains at the discretion of upper-level administrators and may or may not materialize depending on priorities that exist at a campuswide level. Unit discretion will also vary based on how many external dollars can be generated from grants, fees, and endowment support. Units with significant revenue generated from such sources have much greater discretion than units without such revenue streams.

Budget and finance offices for the campus track line item expenditures to compare with estimated expenditures, but their primary focus is the bottom line expenditure budget for each major unit. If expenditures by month in total begin to exceed estimated expenditures, they notify the manager in charge of a unit to ensure that total expenditures are in line with budgeted amounts. Overages within individual line items are generally not an area of concern because of the discretion available to each unit manager to shift funds as needed. If total unit expenditures appear to be exceeding the proposed budget, unit managers must identify additional revenue sources that will be provided to cover these overages.

CONCLUSION

Target-based budgeting is a little-recognized but extensively used approach to public budgeting. It provides both executive control and decentralized flexibility. Advantages include reduced bureaucratic reporting and procedural systems, increased policy involvement by elected officials, and reduced conflict over expenditure decisions. Problems with the approach are often associated with limited support by elected officials and chief executives, lack of accurate revenue forecasting, and extending the approach beyond general fund tax dollars to units generated substantial dollars externally.

As the previous case study demonstrates, TBB can work effectively if it is designed to accommodate the governmental structure in which it operates. As with any budgeting approach, failure is likely unless that budgeting approach fits within the organizational environment.

Budgeting: Allocation Formula

Patricia Moore

Public Administration Department, Kean University, Union, New Jersey, U.S.A.

INTRODUCTION

Allocation by formula is one of the decision rules used in the United States by budgeters to allocate scarce resources in the public sector. Other rules include budget allocation in terms of existing base plus a fair share of the increment or decrement, top-down containment rules, and targets and relative merit.^[1] Mikesell described an allocation formula as a quantitative mathematical equation used to distribute grant funds to eligible recipients.^[2] Wildavsky suggested that allocation formulas for public-sector program expenditures evolved out of recurrent budget processes.^[3] Usually, an allocation formula is specified in legislation, but sometimes it is provided by regulation.

In the Western world, the underlying theory surrounding formula allocation seems to be a calculative logic that formulas are sensitive to the concerns of democratic government. These concerns include equity, efficiency, and effectiveness of service provision on behalf of the (voting) population. In the United States, prior to World War II, budget allocations were often based on historical precedent or negotiation; however, since that time, federal and state governments have progressively shifted in favor of distributing aid to states and localities by formulas.^[4] This shift to formula allocation may have dampened the political problems naturally arising from the annual competitive budget appropriation process in Congress at the federal and state levels of government.^[5]

A good allocation formula should be free from perverse manipulations, open to review, and should distribute resources equitably across governmental units. Moreover, it should be understandable, equitable, adequate, and predictable. It should also be reasonable in reporting requirements, fiscally accountable, and politically acceptable.^[6] Grizzle suggested that the design of an allocation formula should give primary consideration to program objectives, operational measures of objectives, data availability, and simple methods.^[1] Although formulas can be used to direct funds to individual service providers, historically, they have been directed at aggregations of service providers: state governments, hospitals, counties, municipalities, and school districts. In the United States, formulas are frequently used to determine allocation levels for various intergovernmental fund transfers, such as general

revenue sharing, block grants, and categorical grants.^[7] While formulas are used to allocate resources for many different governmental functions, they are most widely used in education, health, housing, and commerce.^[8]

WHY ARE ALLOCATION FORMULAS USED WIDELY IN BUDGETING?

Formula allocation is appealing in public budgeting, because it has several advantages. Formula allocation makes justification for budget requests easier. It also has an appearance of neutrality and rationality, because a formula allocation is expressed as a mathematical equation. Using a precise mathematical formula can make the allocation plan less controversial and, therefore, more politically acceptable. "A multitude of (redundant) statistical variables may be politically necessary to rationalize a program, to at least give the appearance of responding to special circumstance."^[9]

Furthermore, allocation formulas allow for greater precision and accuracy and thus save legislative time and energy in arguing about the intended appropriation. Allocation formulas provide local government a reasonable assurance of the general level of funding they are to expect; thus, they keep planning from being chaotic. Another advantage of formula allocation is that it suggests consistency and fairness. When the objective is equalization, allocation formulas seem to be an effective instrument for redistributing public resources. Their transparency and stability tend to reduce the possibility of manipulation, therefore, facilitating equity.

A well-designed allocation formula simplifies program administration, reduces paperwork, as well as provides state and local governments a reasonable degree of fiscal certainty. In addition, formula allocations reduce the discretion of federal administrators in the review process, allowing public administrators to insulate themselves from political pressures.

TECHNICAL NATURE OF ALLOCATION FORMULAS

The typical allocation formula has a complex structure entailing the identification of several variables. For example, the United States Department of Agriculture

allocates funds to school districts for their Breakfast Program using the following formula:

$$M = \text{NAP}_1 * \text{NPB} + \text{NAP}_2 * \text{NFB} + \text{NAP}_3 * \text{NRB} + (\text{NPB} + \text{NFB} + \text{NRB}) * 0.06 + \text{AD}$$

M is the amount of federal funds given to the school district, NAP_1 a national average payment (NAP), NPB a NAP for paid breakfasts, NAP_2 a NAP prescribed for free breakfasts, NRB the number of reduced priced breakfasts, and NFB the number of free breakfasts.

Allocations to school districts are calculated by multiplying the number of paid breakfasts served to eligible children during the fiscal year by a NAP; multiplying the number of breakfasts served free to eligible children by a NAP prescribed by the Secretary of Agriculture for free breakfasts; and multiplying the number of reduced price breakfasts served to eligible children by a NAP prescribed by the Secretary for reduced priced breakfasts. School districts also receive an additional six cents for every breakfast served. Schools with a high percentage of needy children and high breakfast costs may receive additional payments.^[10]

In adopting allocation formulas, the U.S. Congress commonly uses measures that closely represent at least one of the following characteristics of the recipient government: “need,” “capability,” and “effort.”^[11] Krepes and Slater suggested that few allocation formulas include all three measures, however, more than half include a measure of need. “Need” often refers to the population to be served, while “capability” refers to the ability of a jurisdiction to meet the defined need from local or state funds. “Effort” refers to the actual amounts of local or state revenues available for the need. One common measure of “capability” is per capita income. School districts often use per pupil property values as a measure of “need,” while per pupil expenditures are frequently used to measure “effort.”

TYPES OF ALLOCATION FORMULAS

Formulas may be demand driven or resource constrained.^[1] The main characteristic of a demand-driven formula is that allocations are driven by the need of the different units, e.g., school districts, states, or municipalities. It is mainly used to stimulate action by the recipient government as much as possible. Demand-driven formulas are more appropriate when policy makers value controlling agency behavior more than agency spending.^[12] One of the disadvantages of a demand-driven formula is its unpredictability in terms of the level of total spending that will result. Medicaid in the states and the federal government shares an example of a demand-driven formula. Total spending

depends on the number of people entitled to have their medical care paid for by the government, those who apply for help, and the basket of services for which the states reimburse health-care providers.

On the other hand, resource-constrained formulas place a limit on the resources available for a specific purpose. Each unit’s allocation is determined by its percentage of the total appropriation. An example of a resource-constrained formula is the equation used to allocate resources to the airline industry in the aftermath of the September 11, 2001, attack on the World Trade Center in New York City. According to the Air Transportation Safety and System Stabilization Act, the federal funding formula was based on each carrier’s share of the industry’s flying capacity, measured in available seat miles.^[13] Specifically, the allocation for each airline was the total aid provided by the federal government multiplied by the percent of the industry’s total flying capacity, i.e., number of seats multiplied by total miles. This formula determined what fraction of the total appropriation each airline received. When controlling spending is more important, the resource-constrained funding formula is more likely to be effective in containing spending than demand-driven formulas.^[12] The main difference between the two is that demand-driven formulas may not have funding ceilings but resource-constrained formulas do.

WEAKNESSES OF ALLOCATION FORMULAS

Allocation formulas are often incredibly complex.^[14] Frequently, they require a bewildering combination of mathematical calculations, i.e., addition, multiplication, subtraction, squaring, and even quadratic equations that all too frequently produce unsatisfactory results. Quite often, they are not clearly understood by policy makers, program designers, or even the statisticians. Mathematical models, from which policy makers derive allocation formulas, fail, even with the best available data, to produce the desired allocation pattern, because models generally represent an oversimplification of the real world.

Although proponents of allocation formulas suggest that predictability is one of their strengths (especially when compared with policy makers’ caprice), in many instances, public administrators find they cannot predict the results the formula will produce. Also, often, the formula or model does not reflect the complexity of natural and social phenomena. Unpredictability, as a result, cripples long-term planning and budgeting at all levels of government. This inability to plan, ironically, makes for poor policy execution because of the simplicity of the models and formulas.^[4]

It is not an easy task to design a formula that closely approximates congressional intent; however, the job

gets more difficult when the legislature does not make the goals and objectives of a particular program clear. As one might expect, a decision to adopt a specific formula involves a series of distinct prior choices. An inappropriate decision at any of these steps in the process may lead to a formula, which results in skewed allocations. Generally, in the United States, Congress does not legislate the use of direct measures in the mathematical formula, so statisticians have the arduous task of finding measures that adequately operationalize legislative intent. Quite often, this is not achieved.

A central dilemma for formula allocation is that while it simplifies justifications for budget requests, it frequently presents difficulties in reconciling various policy objectives. For instance, the U.S. Department of Transportation Highway Funding Formula attempts to meet a relatively large number of objectives, some of which are in conflict with one another. For example, one objective is to return funds to the states. At the same time, the program must address national goals and deal with “externalities,” which often require redistributing resources from one state to another.^[15]

PROBLEMS RELATING TO DATA SOURCE

Allocation formulas rely on data that need to be reliable and valid. But frequently, bias and corruption in the gathering and use of data create serious problems, which might not be easily corrected. In other words, it is suspected that other airlines might not have submitted valid data.

Another concern with formula allocation is that irrelevant or outdated factors often undermine the funding calculations for certain services. For example, the formula for apportioning federal highway funds among states is derived from a complicated set of calculations. The U.S. General Accounting Office (GAO) described the formula as cumbersome, relying on factors and data, which, in some cases, are outdated and irrelevant.^[16]

In many cases, allocation measures are selected solely on the basis of familiarity, plausibility, and ease of administration. One measure that is frequently used is per capita. States in the northeast tend to have an advantage when formulas are based on per capita, because they are more densely populated. Those in the south tend to fare better when the formula requires units of \$1000 of personal income. On the other hand, states in the west topped distribution figures when the formula relied on a percentage of local general revenue.^[17]

Furthermore, allocation formulas frequently require census data; however, census data have problems. Census data tend to undercount persons living in rural

areas, ghetto areas, and large cities. Critics of the use of census data maintain that large numbers of Hispanics, African Americans, American Indians, and Asians are frequently missed by the census, with the undercount resulting in a loss of federal funds to minorities. But, others argue that the debate over the significance of the undercount has been highly distorted, even misleading.^[17]

In terms of the fiscal stakes, the GAO 1998 study found that only 0.5% of the \$185 billion distributed by the federal government was affected by the overall undercount.^[17] The reason suggested is that population is only one of several factors in most federal grant formulas, and many programs designed to help distressed communities actually reduce funding when population increases. Even when grant increases are pegged to population gains, the critical factor for a given jurisdiction is not merely its absolute population, but its population relative to other jurisdictions—a result that can obviously hurt as well as help minorities.

However difficult it may be to understand and evaluate the performance of a formula, the task of foreseeing and assuring good performance is even more difficult.^[11] There seems to be three issues. First, the formula may require data that cannot be updated frequently. Policy makers often argue that the formula makes allowances for the data. But often, the degree of distortion caused by the use of obsolescent data cannot be estimated precisely at the time allocations are made. Second, data, which can be updated, may depart from their historical behavior and from their assumed stable relationships with other variables. Third, the social or economic problem to which the program is directed may evolve in such a way that the measure chosen may no longer be the most relevant measure available.

CONCLUSION

Allocation formulas reflect political and economic relationships among federal, state, and local governments. They are effective and convenient tools used to translate congressional intent. When used correctly, they give a predictable framework for government organizations to use to meet needs through goal setting, careful planning, control, oversight, and review. Formula allocation generally guarantees funds to state and local governments based on economic or demographic factors outlined in the formula. Citizens tend to be accepting of allocations that are based on formulas, because they have an aura of objectivity and fairness. Nevertheless, their effectiveness can be severely hampered by data that are stale, inaccurate, and irrelevant.

Budgets and Accountability

Jonathan Justice

School of Urban Affairs and Public Policy, University of Delaware, Newark, Delaware, U.S.A.

INTRODUCTION

From one perspective, public budgets and budgeting processes may be viewed as being, first and foremost, instruments of accountability. Accountability can mean almost anything, depending on who is defining it, but, at its core, involves the communication of governing expectations for the conduct of those held accountable and the subsequent communication of accounts of that conduct to those holding them accountable. Public budgeting, both in its decision-making processes and in the documents recounting the decisions made, determines the substance of what officials are expected to do with public resources, as well as the manner and extent to which particular individuals and groups in a society are involved in specifying those expectations. Budgets, together with after-the-fact financial reporting, also constitute accounts of decisions and action by means of which stakeholders, including the general public, can hold public officials accountable for their resource-using behavior.

A century of budget and financial reporting (or “accounting”) reforms in the United States have been aimed largely at making budgeting a more effective means of holding users of resources accountable to others. As reformers and other students of budgeting have learned, budget processes, formats, and the distribution of financial information are important factors in determining whether, to whom, and for what public organizations and administrators are actually accountable in their use and application of resources, and, just as budgets themselves are instruments for making tradeoffs among valued uses of resources, budget design choices often involve their own tradeoffs. Efforts aimed at improving budget and financial reporting formats and processes have borne considerable fruit, aided considerably by developments in information technology (IT). Efforts to educate and engage the public have been less successful, after the initial successes of the New York Bureau of Municipal Research in the early twentieth century.

Technical progress notwithstanding, significant challenges of accountability for public resource-use decisions exist at the dawn of the twenty-first century. In spite of our historically unprecedented wealth, contemporary Americans may, in our desire to get

something for nothing, be trading off our own welfare against that of future Americans. If we are to make it clear to ourselves as a polity whether and to what extent that is true, continuing progress toward solving technical problems of process and presentation design is as necessary as it is likely. Much greater progress in the practice of public attraction and education is equally or even more necessary, however, if we are to have any prospect of succeeding in holding ourselves accountable to future generations for wise stewardship of collective resources.

ACCOUNTABILITY

Accountability in the simplest, idealized, managerial-instrumental sense provides a means for one person or group (the principal) to manage (or at least influence) the actions of another person or group (the agent), as it relates to some expectation of performance. This model of accountability relies on the prospect of postperformance sanctions and/or rewards, applied after an examination of the agent’s behavior and/or the results of that behavior, as an efficient way to provide incentives for the agent to satisfy the principal’s expectations. Key elements in this model of accountability, then, are the principal–agent relationship, the ex ante stipulation of expectations, the ex-post account that enables comparison of actual with desired behavior and outcomes, and the actual/anticipated application and effects of sanctions or rewards. For this form of accountability to be effective, it is generally presumed that all four elements must be in place and recognized by all parties to the relationship. There must be a principal–agent relationship and a delegated task or responsibility such that the parties are able to establish a relatively unambiguous (and feasible) set of expectations for the agent’s performance. There must be an account of the agent’s performance through observation by the principal, reporting by the agent, or some other means of monitoring by which the principal can determine accurately and reliably whether the agent’s performance satisfied those expectations. There must also be at least the potential for sanctions to be applied in the event that performance is not

satisfactory. The agent's internalization of the principal's expectations (and acceptance of them as legitimate and/or likely to be enforced) can improve the efficiency of the arrangement by reducing the need for monitoring and application of sanctions by the principal.

Accountability, in practice, however, takes a nearly infinite variety of additional forms, including those based on indirect or mediated relationships linking principals and agents, relationships of agents with multiple principals who hold competing expectations, and other relationships in which there is not an obvious principal and agent—more non-hierarchical relationships such as those with collaborators or social and professional peers.^[1,2] Even in what are apparently relatively straightforward principal-agent settings, efforts by agents to manage the often ambiguous expectations of principals can lead to complications in the relationship and behaviors.^[3] Accountability of public servants in democracies is, in some ways, particularly problematic, as illustrated by the evergreen debate over professional discretion and expertise,^[4,5] and by the way in which principal-agent models become paradoxical when street-level bureaucrats are required to hold accountable the citizens who are presumed through a lengthy chain of delegated relationships to be holding the bureaucrats accountable.^[6] The complexity and scale of modern governance and the concomitant rise of professional specialization and expertise, together with increasing reliance on privatization and other indirect means of public-goods production, introduce additional challenges to the simple model of hierarchical accountability of street-level bureaucrats to managers, managers to agency heads, heads to elected officials, and elected officials to voters/citizens.

Even in all of accountability's variety and complexity, however, certain elements generally must remain if we are to speak of being held accountable or holding others accountable: expectations and accounts. First, there must be some form of social relationship, in which the parties to the relationship recognize that one (or more) of them has particular expectations *ex ante* about how the other(s) will behave in a given situation. All parties who will hold or be held accountable must know what those expectations are, if accountability is to exist in any meaningful form. That is, we must be able to determine *to whom* and *for what* some person(s) is/are accountable: Whose expectations legitimately establish normative standards for action, and what is the substance of those expectations? Second, in order for one to hold another accountable (or oneself to be held accountable) *ex post*, it must be possible for the behavior of the one(s) held accountable to be monitored by or, in some other fashion, made known to the one(s) holding them accountable. Practically speaking, this means

that when direct monitoring is not feasible, an account must be provided to the holder. It also means that the substance and intelligibility of that account, as well as of the benchmark statement of expectations, will influence the holder's response to the behavior of the party(ies) held accountable.

BUDGETS

Public budgets and budget processes are critically important in public policy and administration, even for those who despise them, because they are precisely the determinants of politics' "who gets what, when and how." Budgets are made necessary by the simple reality of *scarcity*. Households, governments, and other organizations generally do not have access to unlimited levels of resources and so must make choices, trading off some of their costly, valued goals against others: guns vs. butter; present vs. future consumption; tax expenditures vs. overall revenue capacity; internal waste or misappropriation vs. desired outputs; and so on. One of the benefits of replacing department-by-department legislative appropriations with the comprehensive, annual or biennial budget processes adopted in many U.S. state and local governments around the turn of the twentieth century was that it provided for explicit consideration of relative priorities and tradeoffs. In order to accomplish this trading off, budgeting performs at least three broad functions: *planning* (social resource allocation); *management* (bureaucratic resource allocation); and *control* (regulation of resource consumption).^[7,8] Government budgets, thus, can be understood as statements of cultural and political values and preferences for allocating societal resources toward desired social outcomes, as devices for managing allocated resources in the interest of efficiently and effectively achieving those outcomes (and their antecedent outputs), and as means to prevent the misuse of allocated resources.

As strategic plans and instruments of managerial and operational control, budgets stipulate *expectations* concerning the levels of resources available for particular public purposes during particular time periods and how and by whom those resources are to be employed in efforts to achieve those valued ends. Government budgets express those expectations in the form of laws—appropriations enacted by legislatures, approved by executives, and presumably legally binding on all concerned. A budget document also serves as an *account* of what has taken place over the course of a budgetary decision-making process. Budget processes normally include a series of activities encompassing, to some degree, the formulation and communication of expectations concerning resource allocations and use, as well as the production and

evaluation of accounts describing the use of resources. The form and content of budget documents as well as of budget formulation processes, budget implementation (or “execution”) activities, and various accounts thereof are, thus, key determinants of who among public organizations and officials will be accountable as well as how (and how well), to whom, and for what they will be accountable. Thus, the illustrative history of achieved, failed, and potential future reforms and practices of public budgeting, financial management, and reporting in the United States over the past century demonstrates some of the ways in which budget formats, processes, and reforms influence the quantity and quality of accountability, for the allocation and consumption of public resources.^[9,10]

BUDGETS AND ACCOUNTABILITY

Returning to our two questions concerning the nature of accountability in particular instances—accountable to whom and accountable for what—we can now consider a few of the implications for accountability of the structure and content of budget processes and formats. Under the “for what” heading, the characteristics of budgets as means for formulating and describing choices about tradeoffs, broad resource allocations, and specific uses of resources—that is, the substance of expectations—come to the fore. The question, “accountable to whom,” introduces complexities regarding the availability and usefulness of budgets and financial reports as accounts as well as matters of how the design of budget processes determine who participates in the formulation of the expectations embodied in budget decisions. Both areas of concern lead to the murkier, but no less important, matter of who is being held accountable for budget choices and practices.

Accountable for What

The history of U.S. budget reforms throughout the twentieth century played out in large part as a matter of budget format. It is customary to divide budget formats according to the three-part, planning-management-control distinction: Planning is associated with a variety of program-budget designs, management with “performance” budgeting, and control with line-item or object-of-expenditure formats. Each orientation implies a different for-what emphasis of fiscal accountability: outcomes; outputs and activities; or inputs. Within each broad category of formats fall a range of specific approaches, each of which can vary considerably in the level of detail to which expectations are specified.

Schick’s historical review of budget reforms in the first two-thirds of the twentieth century noted that early reforms focused on control as a primary objective to be advanced by budget formats, thus leading to line-item budgets that specified in considerable detail how appropriated funds could be spent.^[8] This was meant to reduce misappropriation in the form of fraud and waste, by holding public officials accountable for spending public money only on those inputs (“objects of expenditure,” such as certain types and quantities of specialized labor, particular items of equipment, or certain kinds of materials and supplies) specified by the budget. A second wave of reforms emphasized managerial control of organizational performance: activities and outputs. Thus, performance-based budget formats emphasize what is to be done or accomplished by allocating resources and imply a need for good measures of organizational performance relative to money expended. Budgets and ex-post reports in a performance budgeting regime lead, thus, to accountability of public officials for provision and production of particular desired goods and services and for productive efficiency. Finally, program budget formats such as the planning-programming-budgeting system or zero-based budgeting emphasize social planning and accountability for the accomplishment of desired broad social outcomes or even social welfare in general. Schick, in his historical review, pointed out that each version of reform reflected particular concerns of reformers about for what they wanted public officials and organizations to be held accountable. And indeed, at least one empirical study has found that the format of a budget presentation does, in fact, direct the attention of elected officials in just these ways.^[11]

Schick also noted that in the past, practical limitations on the ability to “cross-walk” budgetary allocations across the different formats had constrained reformers’ ability to implement performance- and, especially, program-budget reforms fully. Line-item formats and budgetary presentations aligned with administrative structures are better adapted to budget execution, by contrast with program budgets that may gather together in a single allocation category activities undertaken by multiple administrative units. This problem was largely soluble by using computers to store, retrieve, and manipulate budget and financial data, even by the time Schick wrote in 1966, and contemporary IT is exponentially more powerful in the early twenty-first century than it was in the 1960s. Still, the most grandiose reform schemes, aimed at holding government accountable through the budget for achieving broad programmatic goals of social welfare, largely came to naught for a variety of reasons: resistance to change; the failure of human decision makers to expand their information-absorption and information-processing abilities as rapidly as computers

have; and, to some degree, both the technological infeasibility of holding officials accountable for generating social outcomes from monetary inputs in the face of our imperfect understanding of how to transform money into social welfare and the political infeasibility of reaching agreement on unambiguously stipulated policy goals.^[12]

Still, U.S. governments have taken a number of steps in recent years to reform budgets from the perspective of making it possible to hold governments and public officials more accountable for more aspects of resource allocation and use, with much of the credit due to professional associations and standard-setting bodies as well as good-government groups. Many state and local budgets include at least some elements of performance and program information, and the Government Finance Officers Association (GFOA) promulgates standards for, and offers awards to recognize, exemplary budget presentations. Even the U.S. federal government has of late begun more or less systematically to assess the performance of programs on a regular basis, through its new program assessment rating tool, and to use that assessment in budget formulation. More traditional state and local accountability expectations exist in the form of reporting obligations, balanced-budget requirements, debt restrictions, and other constitutional and statutory prior constraints on budgeting and financial management. State and local governments respond as well to the reporting standards embodied in the generally accepted accounting principles (GAAP) and service efforts and accomplishments, reporting recommendations promulgated by the standard-setting Government Accounting Standards Board (GASB). Additional steps that can be taken fairly readily by municipalities in particular include being more explicit in their budget presentations about relevant legal obligations and constraints and about the economic contexts that influence revenue and expenditure choices, and providing information in budgets and annual reports that facilitates translation between budgetary and financial-reporting bases of accounting.^[9]

Progress notwithstanding, any number of “accountable for what” issues remain unresolved. One perennial discussion concerns the matter of budgetary time frames—the period of time for which budget formulators and implementers are to be held accountable. One question concerns the appropriate time period for budgetary planning and balance: Should it be annual, as is most common in the United States, or cover two to five years, or should it employ a multiyear perspective that provides for balance over the full business cycle, with operating deficits in recession years balanced by surpluses in expansion years?^[13] A related issue is the familiar “use it or lose it” problem associated with budgetary periodicity: the perverse incentive

for operating units to rush to spend appropriated but currently un-needed funds before the end of a fiscal period, rather than losing the available budget authority and facing reduced allocations in future periods. Additionally related to time is the question of delayed effects: Spending in the current fiscal period may be linked with program outcomes several years in the future. What then is the appropriate lag to use in holding officials and agencies accountable for final outcomes?

A final set of accountability-for-what issues involves “the relation of budget documents to reality” and implicates the expectations and accounts generated by budgeting practices and processes as well as formats.^[9] These mainly involve the comprehensiveness and accuracy of budget estimates and financial reports. One form of gamesmanship that complicates accountability is evident at this writing in the federal government’s practice of using supplemental “emergency” appropriations, rather than the regular budget to fund readily predictable war expenses on the order of \$100 billion per year. This, of course, means that estimates of budget (im)balance and tradeoffs among priorities in the regular budget process are misleading, because they do not account for this large group of expenditures. A related practice that muddies accountability is the use of extensive inter- and intrafund transfers of funds during a budget year: The actual use of resources may vary significantly from the initially articulated expectations and accounts embodied in the adopted budget. Another practice that undermines accountability by facilitating “rebudgeting” is the systematic underestimation of revenue and overestimation of expenditures, which provides elected officials and administrators with extra funds they can allocate during a fiscal period.^[14] After-the-fact reporting (accounting) that clearly highlights comparisons of actual to budgeting revenues and expenditures can make it easier to determine whether rebudgeting responds to unforeseeable exigencies or has become a habit for officials seeking to avoid accountability for resource allocation and use.

The proliferation of off-budget entities and means of incurring debt are other common ways of manufacturing “fiscal illusions” that can succeed *in the short term* in evading or deterring of deferring budgetary tradeoffs. However, to anticipate this essay’s concluding remarks somewhat, it is reasonable to ask under the heading of “accountable for what” whether some of public officials’ seemingly reckless and unaccountable practices of creating fiscal illusions with debt, rebudgeting, and selective presentations of information might, in fact, respond to deeper expectations, communicated directly or indirectly to administrators by elected officials and/or by voters to their representatives.^[15] At this point, we can turn to the second question of accountability: to whom?

Accountable to Whom?

Whose expectations form the basis for budget decisions and actions, and to whom are accounts of those decisions and actions available, comprehensible, and actionable? A fundamental tension of large, active, representative governments is between the competing governing principles of professional specialization and the expertise, on the one hand, and popular control, on the other hand.^[4,5] This tension is readily evident in a century of attempted and accomplished budget reforms in the United States. At the turn of the last century, the Progressive-era reformers espoused a range of accountability ambitions. They wanted to attract members of the public to “mind their own business” by becoming involved in making budget decisions, attending to financial reports, and holding public officials accountable for responding to their desires and interests, as activist owners of government.^[16] The budget exhibitions staged by the New York Bureau of Municipal Research (BMR) were famous, innovative attempts to popularize involvement in budgeting by attracting and educating non-specialists. The BMR understood that, in order for public budgeting to be meaningfully accountable to citizens, the public needed not only to have access to accounts and opportunities to communicate expectations, but also to be educated in order to understand those accounts and to formulate and communicate realistic fiscal expectations to officials responsible for the details of budget making and execution.

The subsequent direction of budgeting and financial reporting reforms, however, emphasized the roles of administrators and chief executives in particular. Reforms focused on improving the ability of responsible executives to hold the bureaucracy accountable and implicitly or explicitly relied on those executives in turn to be accountable to the larger public. Practices and standards moved more toward detailed and complex presentations that were very useful for specialists and insiders, but often opaque to non-specialists and sometimes not even readily available for inspection by the general public.^[10] By the end of the 1960s, public budgeting seemed, in large part, an exercise conducted almost in private, with public hearings serving more as ritualized accounts of decisions already taken than as opportunities for the public to convey expectations that would govern officials’ choices and actions. The first few years of research conducted and sponsored by GASB in the 1980s and 1990s reflected the existing bias toward seeing specialists as the key consumers of unfiltered government financial data. Categories of users were understood to include citizen groups (news media, researchers, and advocacy/informational groups), legislative and oversight officials, and investors and creditors; individual citizens were not among

the users of financial reports explicitly considered by the researchers.^[17–20] GASB did sponsor research aimed at identifying standards of good practice for preparing simplified popular financial reports.^[21] The number of jurisdictions preparing such reports is not large, however, and the degree of reduction and selection involved means that only the bravest (or most foolhardy) of officials would be likely to prepare reports that could result in their being held meaningfully accountable for any errors or omissions in their fiduciary roles.

For many in the field, the taxpayer revolts results and tax-and-expenditure limitations of the 1970s and 1980s—with California’s Proposition 13 perhaps the seminal instance—changed the game in some fundamental ways, as did the near-bankruptcy of New York City in 1975. The 1980s also brought President Reagan’s efforts to cut off Congress’s allowance by reducing federal tax revenues. Cutbacks, tradeoffs, and conflict came to be familiar concerns for public budget professionals, and the attendant revenue squeezes together with apparent contempt for government and public servants among the U.S. citizenry prompted a variety of professional innovations. The last quarter of the twentieth century brought, among other things, the creation of GASB; the “reinventing government” movement and Vice President Gore’s National Performance Review; the promulgation by GFOA and other professional bodies of a range of standards and recommendations for increasing public awareness and understanding of, and participation in, budget processes and decisions; improvements in the craft of performance measurement and renewed efforts to link performance measures to budgets; a raft of federal legislation such as the Government Performance and Results Act and the Chief Financial Officers Act; greater regulatory scrutiny and improved disclosure practices in the municipal bond market; and an almost sickening repetition of the mantra of “accountability” in public discourse. The latter part of the twentieth century also brought, however, increasing sophistication in the creation of “fiscal illusions,” using both traditional means such as debt-issuing public authorities and “one-time” revenues, and newer approaches such as permanent peacetime budget deficits at the federal level, the Orange County investment pool, the issuance of bonds to finance pension obligations, and load-shedding privatizations of operating responsibilities and infrastructure at all levels of government.

INTO THE TWENTY-FIRST CENTURY

Are we better off today, in terms of accountability for the allocation and use of public resources, than we were in the last century? It all depends on what

we mean by “accountability.” Public officials do appear to be accountable for more, and to more audiences, with respect to their budget and financial-management actions, with every passing year. At the same time, it is not clear that this increased accountability is encouraging improved stewardship of collective resources. Also unclear is whether contemporary movement away from fiscal sustainability is a failure of public servants’ accountability—perhaps due to a still insufficiently aroused and informed public—or a triumph of accountability to contemporary voters and interest groups that reflects their unconcern for the interests of future generations.

Certainly, there are some positive signs, particularly with respect to the quantity, quality, and availability of after-the-fact reporting and financial information; to some degree in the design and information content of budget formats and processes; and to a lesser degree in some apparently sincere efforts to engage the public in the formulation of budgets. The work of professional associations, regulatory bodies, special- and general-interest watchdog groups, and standard-setting organizations has certainly improved financial reporting and disclosures by state and local governments, as well as the potential for more comprehensive approaches to budgeting. The calculation and publication of performance measures, and their utilization in budget processes and decisions, while still modest for the most part, appear to be on the increase at all levels of government. Specialists in the field are increasingly able to use improved cost-accounting methodologies and data, many governments produce tax-expenditure budgets and multiyear financial estimates and plans, and fiscal notes often accompany legislative proposals. More and better accounts of financial condition and performance are available to those with the time, skills, and incentives to obtain, examine, and understand them, especially financial professionals. It can reasonably be hypothesized that the expectations of bond rating agencies and investors calling for prudent long-term financial management by state and local debtors influence budgeting and financial management practices to a significant degree. Recent developments in IT, particularly the World Wide Web, have brought with them the promise—and in a few instances the reality—of “providing better information in better ways” to more stakeholders, including the general public.^[22] By 2006, more than 90% of the 1069 jurisdictions that earned the GFOA’s 2005 Distinguished Budget Presentation Awards had adopted the GFOA’s recommended practice by posting their budget documents on the Web, up from less than 60% of a 2004 sample of winners of the award for 2003.^[23,24] The website Guidestar.org continues to expand the scope of its information on the finances of non-profit organizations. Refinements to GAAP

and other professional standards continue to improve the technical comprehensiveness and comparability of government financial reports and disclosures. The journals published by the GFOA and the International City/County Management Association routinely feature exhortations and practical recommendations for meaningful performance reporting, the use of performance information in budgeting, active citizen participation in budgeting, and popular financial reporting.

Technology and professional standards, however, have not yet proved and probably never will prove to be silver magic bullets capable of simply erasing the challenges to accountability in public budgeting, which continue to bedevil would-be reformers. Political processes, almost certainly, will never operate with perfect efficiency nor generate the economically optimal results that experts’ cost-benefit calculations prescribe. Budgeting is no more likely—in fact, it is probably less likely, alas—to be a topic that overcomes the competing day-to-day demands on citizens’ time and attention that constrain their active involvement in political and policy-oriented activities. Thus, large portions of the public may fail to avail themselves of even the best and most widely disseminated information and opportunities to participate in budget formulation. An additional problem of accountability in using program and performance-oriented models of budgeting is how to respond to results. If a program crosses organizational lines, which administrative organizations should be held accountable and which held harmless for program failures? Even when good performance measures are computed and reported, the paradoxes of performance measurement makes using such data in budget decisions less than perfectly straightforward: Does poor performance call for budget cuts as a way to stop wasting money, or does it mean that additional resources are needed? Does good performance call for budget increases on the assumption that more money will yield more of a good thing, or does it indicate that a program’s budget can safely be reduced or held steady?

Finally, it may be that we in the United States—ordinary citizens, power brokers, and public servants alike—are, at least in part, failing to hold *ourselves* sufficiently accountable *to* future generations in the United States, *for* responsible stewardship of our collective wealth. At all levels of government, we seem to be satisfied, in practice if not in our public exclamations, only by the continuing creation of more fiscal illusions—resulting in growing external debt, neglected infrastructure, and other burdens on our descendants—as we demand tax cuts without reductions in collective benefits. Lewis writes of a prevailing “paradoxical public attitude whereby the public advocates specific programs but rejects the aggregate cost,” and observes, “Neither increasingly stringent professional standards

nor advances in technology and technique appear to have altered public perceptions.”^[25] That is, what we have here may be less a failure to communicate expectations and accounts, and more a failure to acknowledge the scarcity of resources and the consequent need to accept tradeoffs that together constitute the fundamental rationale and logic of budgeting in the first place.

Gardiner has written of the three-part “perfect moral storm” posed by climate change: a problem of collective action among contemporary actors seeking to gain benefits for themselves and shift costs to others; technical problems that render imperfect our understanding of the likelihood and consequences of climate change, and of how it may be prevented; and an intergenerational problem of collective action, as contemporary actors seek to enjoy benefits while passing costs forward to a future generation unable to speak for itself.^[26] The structure of that problem is precisely analogous to that of fiscal stewardship, as Gardiner notes in quoting Samuelson’s nicely phrased observation:^[27]

Americans dislike deficits but dislike them less than the alternatives—higher taxes or lower spending. There’s a quiet clamor for hypocrisy and deception; and pragmatic politicians respond with massive borrowing schemes that seem to promise something from nothing. Please, spare us the truth.

In short, much has been done to make public budgeting accountable over the past hundred years and much remains to be done. Public servants, their professional associations, watchdog organizations, and academics concerned with public budgeting and financial management have made great strides toward addressing the technical third of our perfect moral storm, so that it is increasingly feasible for citizens as well as creditors and investors to hold public officials and organizations accountable for their use of resources. Efforts to improve officials’ abilities to grasp and incentives to respond to public expectations as well as the usability and availability to all audiences of meaningful accounts of resource use should continue. But such efforts must be complemented by renewed efforts to engage and educate the non-specialist public, since even the best account may be ignored by or incomprehensible to an ill-equipped or inattentive audience. By making the implications and consequences of collective choices clearer to all concerned, public administrators can at least make widespread public self-deception and hypocrisy less easy and more apparent. In so doing, we can make ourselves more accountable to future as well as present generations. Then it has to be up to the various individuals and constituencies that constitute “the public” to determine whether and how to discharge our own fiscal responsibilities to each other and to our descendants.

Bureaucracy, Economic Theories of

James R. Simmons

Department of Political Science, College of Letters and Sciences, University of Wisconsin-Oshkosh, Oshkosh, Wisconsin, U.S.A.

INTRODUCTION

Economic theories of bureaucracy begin with the assumption that people who act in a self-interested way in the marketplace are the same people who vote, run for office, and are employed in the public sector. Government officials and civil servants are portrayed as acting to advance their own private agendas in the name of the “public interest.” The primary implication drawn from this perspective is that the collective political process fails because participants are responding to incentives other than those assumed by conventional theory. Economic reasoning promises a logical deductive model of how public agencies behave with clear directions for policy analysis and simple normative recommendations for reform.

Classical management theory envisioned public sector bureaucracy as a modernizing form of organization that would ensure precision, speed, reliability, clarity, efficiency, and regularity in the provision of high-quality goods and services. In contrast, modern political economists have developed theories of bureaucracy, which see in these same hierarchical structures institutions that foster self-serving behavior that corrupts the natural functioning of markets and mask the political pursuit of private gain by those who manipulate them. Self-interest in the private sector is said to produce optimal outcomes. However, in all government agencies, this same motivation generates command-and-control monopolies operated by an intrusive, problem-finding elite that overemploys, overpays, overbuilds, and overproduces. Thus, whenever possible, the reliance on the public sector should be reduced and market forces restored.

HISTORY

Much of the prescription for the model organization comes down to us from the writings of Max Weber. In Weber’s bureaucratic world, public employees are rational professionals who follow the routines and duties of the agencies for which they work. Their values are expected to be limited to the neutral pursuit of their organization’s objectives or official norms, while their status is derived from their training, title,

and job performance. Although organization theory has been dominated by adherents of the Weberian perspective, modern political economists have developed a competing diagnosis of bureaucracy that emphasizes public failure in the absence of market discipline. This literature on public bureaucracy can be traced back to Ludwig von Mises and Frederick Hayek. However, neither their works is a recognizable economic account because there is little abstract modeling in either contribution. Formal theorizing about government is best represented by contemporary authors such as Anthony Downs, Gordon Tullock, Vincent Ostrom, and William Niskanen.

Economic theories of bureaucracy begin with the assumption that people who act in a self-interested way in the marketplace are the same people who vote, run for office, and are employed in the public sector. Government officials and civil servants are portrayed as acting to advance their own private agendas in the name of the “public interest.” The primary implication drawn from this perspective is that the collective political process fails because participants are responding to incentives other than those assumed by conventional theory. Economic reasoning promises a logical deductive model of how public agencies behave with clear directions for policy analysis and simple normative recommendations for reform.

The distinguishing feature of economic theory is its concentration on a narrow conception of individuals as inherent utility maximizers. This account of what bureaucrats want is a direct analogy of the standard neoclassical assumption that the managers and owners of private firms maximize profits, because their compensation is tied to performance (materialistic motivation) and because high profits safeguard management against aspiring underlings or potential hostile external takeover bids that would jeopardize their positions (survival motivation). But because public bureaucracies are “non-profit organizations,” what do bureaucrats maximize?

The basic answer (apart from Downs) has been that officials maximize the size of their agency, the size of their budget, or their job satisfaction. Some theorists have suggested that size is assessed primarily in terms of size. Bureaucrats from larger, well-financed agencies will have greater visibility, enhanced reputations for

influence, and higher status among their peers. Comparative budget increases across departments are seen as an indicator of winners and losers in the ecological competition for resources. Bureaucrats in larger agencies control more patronage and have a greater capacity to influence events or overcome resistance. Size also creates organizational slack and excess capacity that allows officials to more easily meet unusual risks or crises whenever they occur.

In addition, maximizing behavior is critical for an agency's survival in two ways. The organization's budget is allocated to it by a "sponsor"—a single, dominant collective entity such as a chief executive, a department secretary, or a committee of the legislature. Sponsors expect to be routinely presented with proposals for increased funding. During the budgetary process, attention will concentrate on the marginal increments being sought. If no such increase is requested, the funding body is likely to become suspicious or disoriented and these procedures become inoperative. Completely static or reduced budget requests are likely to be interpreted as evidence of the bureau's stagnation or loss of initiative.

Senior bureaucrats seek funding expansion as a balm that facilitates agency operations. In large or growing agencies, contentious or incompetent officials can be moved sideways into sinecures. Also, the costs of reorganization can be more easily absorbed and wage demands or staff resistance to change can be more easily bought off. Budget maximization facilitates the hiring of skilled staff, and improves wage and promotion prospects. Client groups also value top officials who expand programs because this will enhance their own agendas. They will even cooperate by mobilizing public support for the agency's policies, especially where key clients are well-organized interest groups.

The economic account says little explicitly about the internal operations of government agencies. Most writers assume that institutional and functional variations among government departments simply do not matter. They generally adopt the view of bureaus as command-and-control organizations run in a top-down manner. This contrasts starkly with markets (which they prefer) that they claim operate as decentralized preference systems. In addition, proponents employ a unitary theory of the firm that treats both private corporations and public agencies as if they are run by a single management team so that they can focus on their aggregate behavior vis-à-vis other actors. The basic differential in the behavior of these "firms" is explained by the profit driven "bottom line" of business and the less measurable "public interest" service imperatives of government.

Similar to other organizations, bureaus have an inherent tendency to expand, but with fewer than the

normal constraints on their capacity to do so. Agency growth helps in the retention and promotion of personnel, and it enables leaders to acquire more power, income, and prestige. It reduces internal conflicts, facilitates economies of scale, helps to insulate top officials from social pressures, and strengthens the agency's ability to survive. Larger agencies are also in a better position to manipulate their environment than are small ones. If top officials do not have to pay the costs of adding more personnel, they will be inclined to increase the size of the organization indefinitely because each new member adds incrementally to their total direct action capabilities.

Most economic analyses of bureaucracies posit a fundamental dichotomy between two basic ways of coordinating social activities in industrialized societies—markets and command structures. Anthony Downs labeled this contrast the "*law of hierarchy*." Coordination of large-scale activities without markets requires a hierarchical authority structure. This law results directly from the limited capacity of each individual, as well as the existence of ineradicable sources of individual conflict. In particular, the general self-interest axiom implies that actors will not cooperate unless compelled to do so by an effective command structure. Yet, this ultra-Weberian picture of government agencies is qualified by more stress on an underlying self-centered inclination to resist the demands of their superiors.

Max Weber looked for alternative mechanisms of administrative coordination through the inculcation of a common organizational culture or strong ideology that guides and justifies operations. Yet, economists view all such mechanisms as simply devices for defending collective interests, not as methods to ensure accountability. Bureaus develop ideologies, they argued, to rationalize their activities and insulate them from external scrutiny or criticism. All agencies develop peculiar cultures that enhance member identification with their activities. But none of these devices can substitute for authoritative guidance. Employing ideology to guide detailed policy making risks ossification that inhibits creative responses to new problems or circumstances. The strengthening of agency culture will exacerbate the inherent tendency toward organizational rigidity.

For one organization to monitor another or to coordinate the activity of multiple agencies also requires hierarchical interorganizational relations to overcome resistance from staff in the subordinate bureaus. The law of countercontrol combined with the stress on hierarchy produces duplication because any attempt to control one large organization tends to generate another new bureau. Of course, controlling organizations need not become as large as implementing agencies. But the law does mean that contrasts between

“line” and “staff” organizations often become blurred as supervisory agencies absorb increasing resources. A continuous spiral is likely as top-down control efforts are followed by subordinate agency evasion, which, in turn, produces renewed attempts to secure control.

In addition, strong internal pressures push monitoring bureaus to extend their control over subordinate agencies. The logic is that by placing one agency in a supervisory position over another promotes an “ever-expanding control” whereby the quantity and detail of reporting required by monitoring bureaus tends to rise steadily over time, regardless of the amount or nature of the activity being monitored. Agencies can also be significantly affected by their suppliers, by clients (interest groups or firms that benefit from their activities), and by those entities whose behavior they regulate. A “territorial drive” in all bureaus leads them to define core functions central to their organization’s mission and the more peripheral activities that surround this basic core and are used to insulate it from erosion or attack.

Most economic analyses of bureaucracies view them as uniformly hierarchical organizations for two reasons. First, early authors in the field posited a fundamental contrast between organizations run in a centralized command mode and markets, which are viewed as decentralized preference systems. “In the absence of profit goals, bureaus must be centrally managed by the pervasive regulation and monitoring of the activity of subordinates (von Mises).” For many polemicists, such as Hayek, it became axiomatic that government agencies in the West were comparable in their operation with the bureaucracies of communist states, particularly in their reliance on centralized planning and management systems. Second, methodological assumptions carried over from the neoclassical theory of the firm invariably included an undifferentiated management team that makes unitary rational decisions and is capable of centralized control over the organization.

By collapsing all non-market mechanisms of coordination into voting or command and control, economists exclude other potentially important options, such as:

- Incremental agreements that “balance interests”
- Behavior modification that alters motives
- Interactive “mutual adjustment”
- Participation, delegation, and salesmanship
- Voluntary cooperation between self-interested actors
- Non-hierarchical “kinship” systems of “mutual service”
- Persuasion through logic, charm, and reasoned argument
- Economic and ideological hegemony by a dominant class

- Consensus and accommodation among multiple stakeholders

This unitary control orientation rejects or ignores any solidaristic behavior, public interest orientation, or altruistic values by public sector managers or employees. Within this general framework, only Downs provides a complex, pluralistic perspective of motivation in the public sector. Unless economic theorists can show why these options do not function or will not work, their propositions about behavior in bureaus become tautological, claiming only that “hierarchical organizations must be run hierarchically.”

Variations in institutional form and function will produce differences in agency behavior and influence. Moreover, relationships between agencies are qualitatively different from the relationships between ranks, sections, or groups of actors within one relatively unified institution. These two propositions will seem obvious to a political scientist, but apparently not to those who write public choice accounts. Using simply specified parameters (e.g., perfect competition, oligopoly, or monopoly), economists can move easily from their analysis of how one enterprise behaves in a market to conclusions about the behavior of the industry as a whole. Within this tradition, writers seem bound to the claim that once they understand how “the bureau” works, they have also ipso facto discovered how the entire state apparatus works. Aggregate behavior across bureaus is typically described only in passing. Economic theorists usually concentrate their efforts on demonstrating why distortions in the behavior of public agencies stimulate their growth.

The conclusion they draw is that the most important government problem is the unnecessary and continuous expansion of its bureaucracy. From this perspective, the most corrupting impact of the behavior of top public officials is their tendency to exploit their positions to increase the size of their agencies so that they become much larger, less accountable, and more expensive than they need to be. This general proposition that government bureaus are continuously expanding monopolies leads directly to reform proposals that emphasize encouraging public entrepreneurship and the promotion of competition between bureaus. Thus, political economists favor such diverse measures as bonuses for bureau heads from the savings they uncover, breaking up large centralized agencies into regional entities, allowing bureaucratic duplication in the provision of public goods, and privatizing or contracting out many governmental activities.

Classical management theory envisioned public sector bureaucracy as a modernizing form of organization that would ensure precision, speed, reliability, clarity, efficiency, and regularity in the provision of high-quality goods and services. In contrast, modern

political economists have developed theories of bureaucracy, which see, in these same hierarchical structures, institutions that foster self-serving behavior that corrupts the natural functioning of markets and that masks the political pursuit of private gain by those who manipulate them. Self-interest in the private sector is said to produce optimal outcomes, but in all government agencies this same motivation generates command-and-control monopolies operated by an intrusive, problem-finding elite that overemploys, overpays, overbuilds, and overproduces. Thus, whenever possible, the reliance on the public sector should be reduced and market forces restored.

Bureaucracy: Perspectives

Larkin S. Dudley

Center for Public Administration and Policy, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, U.S.A.

INTRODUCTION

A brief encyclopedia article cannot capture the vast cornucopia of themes and studies that surround the concept of bureaucracy. To introduce some of the bureaucratic literature pertinent to public administration, this entry restricts itself to the following themes: the historical context of bureaucratic scholarship; characteristics of the organizational form; public bureaucracies in their political environment; public bureaucracies in an economic framework; and the case against and for bureaucracy.

THE STUDY OF BUREAUCRACY: HISTORICAL CONTEXT

The term bureaucracy is believed to have its origin as a reference to a cloth covering the desks of French government officials in the eighteenth century.^[1] Early usage referred to an official workplace (bureau), in which individual activities were routinely determined by explicit rules and regulations. From a plethora of conceptions, such as a synonym for civil service to a pejorative term for inefficient and corrupt systems, the usage that has dominated the social sciences is bureaucracy as a form of organization.

The work of Karl Marx and Alexis de Tocqueville documented the historical trend toward increasing bureaucratization throughout modern Western Europe. However, most link the term and tradition of study of bureaucracy to the intellectual legacy of Max Weber, who conducted his study at the turn of the twentieth century, but whose work was not available widely to English-speaking scholars until later translations in the 1940s.^[2] Weber's conception of bureaucracy is understandable in terms of his focus on the legitimization of power in societies, including Chinese, Egyptian, Roman, Prussian, and French administrative systems.^[3]

In Weber's analysis, the bureaucratic form of administration reflected one way in which power could be legitimated. Weber argued that power was the ability to direct others' behavior, regardless of whether those being directed believed it was proper

and acceptable.^[4] Authority, however, represented the legitimate use of power, power believed to be proper by those whose activities were being directed. Three different types of authority were then identified: traditional; charismatic; and legal-rational.^[4] Under a system of traditional authority, the use of power is believed to be legitimate because of belief in time-honored traditions and patterns of behavior, while charismatic authority is imbued in individuals who exhibit exceptional or heroic characteristics. Rational-legal authority derives from belief in the legitimacy of law, including the belief that rules and the authority of officials to perform mandated duties are legitimate. Thus, the legal authorization of individuals to behave in a certain manner (e.g., the use of coercion) is a crucial dimension under rational-legal authority.

According to Weber's historical analysis, distinctive types of administrative systems are associated with each type of authority. Rational-legal systems of authority stress impersonal rules and regulations, exemplified in modern rationalistic bureaucracy.^[5] However, the Weberian model of bureaucracy has often been misunderstood and erroneously explained. One source of the confusion is that Weber conceived of his model of bureaucracy as an "ideal type."^[1,6] Ideal in this sense does not mean desirable but, instead, means a simplification of many features to more clearly understand the essence of a construct. Weber understood that actual bureaucratic organizations might exhibit only some of these characteristics or might possess them in varying degrees. The construct identifies bureaucracy by a certain structure and certain characteristics, but the meaning of the term is neither pejorative nor complimentary but instead determined by the context.

CHARACTERISTICS OF BUREAUCRACY

In the Weberian model of bureaucracy, the importance of rules is paramount. Rules become the basis for decisions, displacing individual judgment, and the means to efficiently achieve specific organizational goals. Weber himself was skeptical of bureaucracy and even pessimistic that the bureaucratization of societies would devour the relationships connected to our values.

Following Weber, distinguishing characteristics of bureaucracies include:^[2]

1. *Division of labor*: A clearly defined division of labor with specialization and training for assigned tasks.
2. *Hierarchy*: Authority relations are hierarchically ordered with definite limited areas of responsibility for superordinate and subordinate personnel.
3. *Rationality of rules*: Explicit rules are designed to ensure uniformity of performance and treatment, displacing emotional and personal decision making.
4. *Technical expertise*: Individuals are recruited and promoted on the basis of technical expertise and competence, rather than on personal relationships or luck.
5. *General rules*: Prior publication and general imposition of rules were believed to replace administrative systems of unpredictable arbitrary decisions.
6. *Written documentation*: Official records become important because documentation would make it possible to trace actions and have them inspected by others.
7. *Full and continuous employment*: Career expectations are to be fulfilled within the organization in a full-time capacity. This assumes that fulfillment of one's duty will be the highest priority, thus assuring that clients' legitimate needs will be met if at all possible.

In addition, full and continuous employment contributes to the ability to develop an impersonal and impartial relationship among organization members and with those outside the bureaucracy.

Although Weber certainly saw bureaucratic organizations in relationship to their social, political, and economic environments, the most prevalent study of bureaucratic structure has tended to follow his discussion of bureaucratic characteristics. As Nickinovich, Borgatta, and Montgomery summarized, one focus of study has been the internal characteristics of bureaucracy (e.g., how organizational structure is related to technology and worker productivity, how individuals are integrated within organizations, and how the characteristics of bureaucracy identified by Weber may be inter-related).^[7] In this tradition, scholars have attempted to empirically assess the extent to which bureaucratic organizations exhibit bureaucratic properties or have inter-related dimensions. Other scholars focusing on bureaucratic characteristics, such as Hummel, articulated one of Weber's theses that humanistic values are too easily lost within the bureaucratic ethos.^[8]

One example of later work that combines a focus on the relationship between organizational structure of

bureaucracy and how operators, managers, and executives understand their duties is that of Wilson.^[9] He also furthers our understanding of the differences in private and public bureaucracies, particularly pointing out the importance of the political context in which bureaucracies operate, a subject to which we next turn.

PUBLIC BUREAUCRACIES IN THEIR POLITICAL ENVIRONMENTS

Three important themes relate the study of public bureaucracies to the political environment and political structures of which they are a part. First is the theme of bureaucratic politics, where bureaucracies are seen as important actors in policy decisions. Second is that of the control of the political system over bureaucratic choices and performance, and third is that of the relationship of bureaucracy and democracy, particularly in terms of being representative and responsive.

Two important works more than a decade apart illuminated the importance of the bureaucracy in relation to its political environment. In 1973, the bureaucratic politics approach was singled out by Allison as one of several lenses to view the Cuban missile crisis.^[10] Allison's ability to probe the relationship of bureaucratic processes and interests to the making of foreign policy challenged a view of rational policy making, determined by a monolithic entity that is goal directed and intentional. Instead, as summarized by Allison, the bureaucratic politics model sees policy making as being influenced by many players who act in terms of various conceptions of national, organization, and personal goals in the politics of negotiation and bargaining. The public bureaucracies involved in foreign policy were seen as having their own interests of budgets, power, prestige, and access to the White House, interests that they sought to enhance and protect. Players in the process were viewed as having relative influence in terms of personality and skill and in terms of where they were hierarchically in the chain of command.

The influence of the political system on bureaucracy is a different theme, one exemplified in the publication of Wilson's *Bureaucracy, What Government Agencies Do and Why They Do It* in 1989.^[9] Wilson stressed the need to understand the political context. He argued that much of what agencies do was defined from the outside in—by the political structure and culture in which agencies operate. Through several chapters on the relationship of the bureaucracy to the presidency and to Congress, Wilson carefully laid out the difficulties with a political system that asked agencies to serve a multitude of ends and a variety of masters. He noted that public officials and operators must often manage situations over which they have little control, on the

basis of a poorly defined mission and in the face of a complex array of growing constraints.

Finally, the theme of bureaucracy within a democracy has been undertaken by many serious scholars of public administration (e.g., see the scholarly works of Waldo, Kaufmann, and DeLeon).^[11] One manifestation of that theme has been the interest of scholars in both the normative and the empirical study of representative bureaucracy.^[12] This interest is premised on the idea that insofar as the personnel in a public bureaucracy reflect those of its jurisdiction in characteristics such as race, ethnicity, and gender, the bureaucracy will be more responsive. Authors argue that, through ensuring that all politically significant interests and values are represented in the formulation and implementation of policies and programs, the public interest will be better served. A second idea has been that of bureaucratic responsiveness. Scholars have examined the extent to which decisions made in public bureaucracies reflect the preferences of elected officials, interest groups, and private citizens.^[13] This idea has become even more pronounced in literature using an economic framework as discussed in the following section.

BUREAUCRACY IN AN ECONOMIC FRAMEWORK

The 1980s and 1990s brought increased attention to economic-based approaches to describe some of the themes of bureaucratic politics and the relationship of the bureaucracy to its political environment.^[14] Economic theory has stressed that rather than a focus on workers hired for their skills and controlled through authority, as in the traditional concept of bureaucracy, workers should be conceptualized as self-interested. The most noted economic approach, principal-agent theory, views organizations as relationships between a principal, who has a job to be done, and an agent, who agrees to do the job in exchange for compensation.^[15] In such relationships, principals and agents alike seek their self-interest. Although the approach focuses on the driving force of self-interest, it also helps to explain organizational pathologies. For example, information asymmetries plague relationships so that principals may not know if they have selected the best agents or may not be able to tell when agents' work matches the terms of contracts.

Agency theory has influenced both the theories of bureaucratic outcomes and the theories of institutional choice. The bureaucratic-outcome approach questions the traditional theme of bureaucratic politics that emphasizes how bureaucracies resist change.^[16] Instead, principal-agent theory suggests that bureaucracies can be viewed as agents for the principals' (elected

officials) wishes. Thus, part of the research focus has been on the principals' design of incentives and sanctions to enhance their control. As such, principal agency theory maintains elected leaders in the presidency and Congress can and do shape bureaucratic behavior in systematic ways.

Building also upon agency theory and the bureaucratic politics tradition, scholars identified as working within institutional choice theory also emphasize the relationships among agents in the regulatory bureaucracy and their political principals (e.g., legislators, presidency, and interest groups). However, they attempt to model these interactions formally to illustrate how bureaucracies are acted upon, as well as how they perform as actors.^[17] As such, these scholars argue that the design of bureaucracy does not promote efficiency but, instead, is the result of rules that are the result of political forces. Thus, organizations reflect the power of political interests. As Kettl explained, these political interests are understood as selecting among organizational options for the improvement of results, thus giving the approach the name of institutional choice.^[14]

Even more formal models, often within a game theory approach, have emphasized modeling the relationships between the bureaucrats and the rest of the system as a bargaining process. Conflicting arguments about the relationships between the bureaucrats and the rest of the system include one argument that the bureaucracy exploits its information advantages over politicians, leading to bureaucratic budgets too large, bureaucrats too numerous, and bureaucratic output too abundant, as in the work of Niskanen.^[18] Others contend that information asymmetries may actually favor politicians who can control the behavior of bureaucrats.

THE CASE AGAINST AND FOR BUREAUCRACY

A final theme in this brief overview of bureaucracy is that most academic treatments of bureaucracy contain not so hidden biases. Most studies are highly critical, according to Goodsell, who surveys the many kinds of criticisms by grouping them under three broad categories.^[19] The first criticisms Goodsell reviews are those that focuses on unacceptable performance, including arguments of general distrust of public ownership, fear of budget maximization, and the rigidity of bureaucratic forms that produce goal displacement along with other pathologies. A second theme Goodsell sees is the accusation that bureaucracies mobilize dangerous political power; that is, they may be totalitarian or, at the least, elitist in distorting the democratic political process. Finally, Goodsell notes that many academics condemn bureaucracy for its oppressive

qualities. In other words, bureaucracies are portrayed as treating humans, at a minimum, in a callous manner and are often seen as crushing employees and clients. Finally, Goodsell states that a considerable literature has now emerged that attempts to assess bureaucratic performance and power in a democracy in a balanced fashion, pointing out the many positive contributions of bureaucracy as well.

CONCLUSION

Scholarship on bureaucracy will continue to develop somewhat around the themes surrounding the internal characteristics of bureaucracy, particularly concerning structure and performance. However, as is true of organizational theories in general, more literature will focus on how bureaucracy affects and is affected by its environment, particularly its political environment in the case of public bureaucracies. One can speculate that research will also highlight the changing role of bureaucracies in a networked and globalized world. Such scholarship will emphasize that bureaucracies are one type of organizations among others that are a mix of traditional and network forms in private, non-profit, and public sectors, all involved in governing.^[20]

Bureaucratic Agencies: Delegation of Authority

Scott R. Furlong

*Public and Environmental Affairs, University of Wisconsin-Green Bay,
Green Bay, Wisconsin, U.S.A.*

INTRODUCTION

Throughout the history of the United States, there has been an evolution in the role that the federal government plays in our daily lives. For much of our history, this role was somewhat limited. Many point to Article I, section 8 of the Constitution, the enumerated powers section, in describing much of what the federal government did. These powers include, for example, the power to lay taxes, regulate commerce, coin money, and many others. This evolution of the role of the federal government has also occurred within the executive branch itself. The role of the bureaucracy in our daily lives is much different than it was 200 year ago, or even 50 year ago. The expanded role of the federal government, specifically the bureaucracy, is interconnected and has been facilitated by the idea of delegation of authority in the United States. This article examines the evolution of delegation of authority or power, especially since the 1940s and how this evolution has had a major impact on public policy making in the United States.

ISSUES OF DELEGATION OF AUTHORITY

Delegation of authority or power is simply the Congress providing the bureaucracy with law-making powers that are typically held by itself. Congress, for various reasons, has decided that most of the specifics in policy making should be left to the agencies to develop and has increasingly written their statutes in such a way as to provide agencies with expanded authority. This delegation raises numerous issues that political and legal scholars have been debating for years.

One of the primary arguments against delegation of authority concerns the constitutional issue of separation of powers. According to this major component of the Constitution, power is to be divided among the three branches of government. The legislative branch would be responsible for making the law, the executive branch for executing the law, and the judicial branch for interpreting the law. Much of what Congress delegates to bureaucratic agencies is “law-making” power. In other words, when agencies develop regulatory policy that dictates or prevents

some forms of behavior, that is, in a sense, law making. In addition, these same agencies are often given the primary responsibility to interpret and adjudicate challenges against their policies and thus have judicial power as well. Many consider these forms of delegation to be blatant violations of the separation of power principles and thus unconstitutional.

Another issue raised, often in regards to delegation, concerns the issue of to whom the power is actually being delegated. By giving policy-making power to the executive branch agencies, Congress is actually allowing policy to be made by a branch of government that is somewhat removed from the general public and electoral politics. When Congress, or more specifically a member of Congress, votes for a law that we as citizens may not agree with, we have the option of voting against that individual in the next election. This representative role of a member of Congress is the basis of our representative democracy. When we believe that our congressperson is not representing us, we can vote for someone else. But that option is not available when someone within the bureaucracy makes a policy. Bureaucratic officials are either appointed or, more likely, hired based on merit considerations. Voters have some minimal electoral recourse regarding an appointed official in that they could hold the president accountable for the people appointed (although unlikely). If a career official from the Occupational Safety and Health Administration (OSHA) decides to issue a regulation requiring more stringent indoor air quality in the workplace and a person disagrees, he or she does not have the option to vote for another OSHA official. There is no direct representation function and therefore no electoral consequences.

Another issue raised by those concerned about delegation of authority concerns the relationship between executive agencies and interest groups. The issue arises if one is concerned with issues of agency capture. According to capture theory, administrative agencies are beholden to those interests in which they have been created to regulate.^[1,2] In other words, policies adopted by agencies are heavily influenced by the very organizations the agencies were legislated to control. If agencies are captured by the interests they should be regulating, then one has to wonder about the desirability of delegation of authority. As delegation

increases and agencies become responsible for developing more public policy, organizations have more opportunities to dictate the terms of these policies, especially if it is a captured agency. Critics of delegation argue that this provides advantages to the best-organized groups, and not what might be the best public policy.^[3] Others state that delegation eliminates accountability of our elected leaders.^[4]

A potential example of a captured agency was the Civil Aeronautics Board (CAB), which was responsible for the setting of airline rates for the industry. Yet, many believed that the CAB was basically carrying out the desires of the airline industry itself and not necessarily protecting consumers from monopolistic-type practices. This issue was one of the reasons that the CAB was disbanded when deregulation occurred in the airline industry in the 1970s.

Of course, positive issues are also associated with the delegation of authority that many scholars recognize. One of the primary arguments in support of delegation is that Congress is delegating policy making to the experts in the field.^[5] These agency officials can develop, use, and understand the best information (science, economics, risk, etc.) available in the making of the policy. In addition, agency bureaucrats, unlike members of Congress, should be further removed from the political interests associated with policy making because they do not have to worry about re-election.

Another argument made by those supporting delegation relates to the simple time and resource constraints faced by our elected leaders to be able to develop specific policies. Given the growth of the federal role in our daily lives, it would be difficult, if not impossible to expect our elected leaders to be able to develop the vast amount of policy necessary in our daily lives. Of course, this might be an argument in support of a major de-emphasis of the role of the federal government, but that is perhaps a topic for another article. It is unlikely that we will see that type of reduction in the role of the federal government at any time.

WHY DELEGATION OF AUTHORITY?

An important question to ask when discussing delegation of authority is why would Congress willingly abdicate its law-making powers and give it away to the bureaucracy. According to the Constitution, Congress is the law-making branch of government, which means that it has certain authority in our system of government. Why would Congress as an institution be so willing to share this authority with another branch?

Fiorina discussed two major theories as to why Congress may be so willing to delegate authority to

the bureaucracy, the “good government” and the “shift-the-responsibility” models of delegation.^[6] Under the “good government” model, Congress delegates for various reasons associated with the making of better public policy. Delegation allows policy to be made by, theoretically, nonpolitical actors who are experts in the field. Because they are not beholden to constituents through elections or the campaign money provided by special interests, the bureaucracy does not have to be concerned about these outside influences in policy development. They can select the most rational policy and not worry about the political fall out.

In addition, people working within the bureaucracy are careerists and have much information and expertise in the specific policy area. Therefore, Congress delegates to take advantage of this expertise in policy development. We do the same in our daily lives. We seek out doctors, auto mechanics, and electricians to do certain jobs that they are trained to do. Should we do anything less with the development of our nation’s policies? The final element of the “good government” model is that the bureaucracy may have more discretion and flexibility to make changes to a policy given changing circumstances. Congress can write a vague law and allow the agency to apply it to the appropriate situations. As technology, science, or the economic conditions change, the bureaucracy can make changes to a policy more easily, and typically more quickly, than the legislature. These reasons would then support the delegation of authority because the end result should be a better-construed policy, the interpretation of which can be readjusted as necessary.

Fiorina’s other model, the “shift-the-responsibility” model, appears to be a pessimistic view of why Congress delegates policy-making power to the bureaucracy. Under this scenario, Congress delegates for numerous reasons. One reason is that Congress does not have the necessary time and resources to develop specific laws, so they pass general laws and allow agencies to fill in the details, which may be quite extensive. Legislators would rather not spend time on the details of policy for many reasons. First, more conflict will likely arise between colleagues in hashing out the details of a policy. It is sometimes relatively easy to agree on the broad ideas or goals of a policy (e.g., a policy to improve air quality), but how the nation gets to that goal will generate a lot of conflict. In other words, the devil is in the detail. Second, working on the details of legislation will take more time and effort. Delegation allows Congress to potentially pass more legislation because they let agencies work out the specifics of policy, thus freeing congressional time and resources. In addition, they can use the time to do other congressional duties, such as constituent service, to help in their re-election goals.

Politically, the “shift-the-responsibility” model is also rational for members of Congress. By delegating decision making to agencies, Congress can avoid the responsibility of making a “bad” decision. The ultimate decisions that will affect citizens will come out of the bureaucracy through regulations or other administrative policy tools. People may complain about these decisions, but Congress can shield itself from these complaints by basically passing the buck to the bureaucracy. Not only can Congress avoid the responsibility for these decisions but they are also in a position to take advantage of the bad decision and make some political points. Complaints about a policy decision will come to a member of Congress, who can then look into the decision for a constituent through their casework networks. This member of Congress can serve their constituent by fixing this problem created by the agency decision and then claim credit for being a responsive legislator. These behaviors and activities by members of Congress follow closely with Mayhew’s premises discussed in *Congress: The Electoral Connection*, as well as Fiorina’s in *Congress: Keystone of the Washington Establishment*.^[7,8]

Between these two models for why Congress may delegate to the bureaucracy, there are many potential reasons why they are so willing to abdicate their power and responsibilities in policy making. Of course, varying situations may lead to different reasons as to why Congress delegates authority to the bureaucracy. In some cases, a lack of information and a need to use the experts available in an agency might represent a good and perhaps appropriate decision to delegate. In other cases, delegation may occur simply because members of Congress cannot agree on the specifics of a policy; therefore, they pass a general policy direction and give the agencies the responsibility of actually making the law. Whatever the reason, delegation is accepted by many as a fact of life in today’s governmental system. Congress has given agencies broad discretionary authority to make a policy that affects our daily lives, but it has not always been that way. Delegation of authority has gone through some evolution, especially since the 1930s.

EVOLUTION OF DELEGATION

The best way to discuss the evolution of delegation is to start with the definition of the delegation doctrine. The doctrine states, “congressional delegations of power are constitutional so long as they are accompanied by sufficient standards or guidelines so that the executive branch’s exercise of legislative power is not unbridled.”^[9] Note that the doctrine does not prohibit delegation of power, but rather states that delegations need to occur with “sufficient standards or guidelines,”

in other words, rules by which an agency is governed in its use of the delegation. For a large part of our nation’s history, the courts upheld the delegations that Congress provided to bureaucratic agencies due to the standards provided. However, the New Deal era ushered in a tremendous expansion of federal government agencies and responsibilities that brought the delegation issue to a head. This expansion of government authority is most directly tied to the enumerated power of regulating commerce among the states. Because so many of our goods and services are transported between state borders, now more than ever but even in the early-1900s, Congress could use this power to govern many activities.

The Supreme Court became involved in the issue of delegation during the New Deal, specifically in the ruling of three separate cases, in which the court ruled that the congressional delegation was unconstitutional. The three cases, *Panama Refining Co. v. Ryan*, *A.L.A. Schechter Poultry Corp. v. United States*, and *Carter v. Carter Coal Co.*, examined the issue of congressional delegation.^[10–12] In *Panama Oil*, the court ruled that the delegation that authorized the president to prohibit interstate shipments of contraband oil was overly broad. The court ruled in the *Schechter* case that there were not clear policy directives from the legislature in the issuance of “codes of fair competition” for particular industries. The issues were similar in *Carter Coal*, with the additional concern that the delegation had, in effect, been made to committees of industry representatives and not government officials.^[13] In general, the court was very concerned about the vagueness of these delegations and the amount of authority provided to nonlegislative personnel to make policy.

This time period was also one of the last times where the court ruled so conservatively on the delegation doctrine. President Roosevelt, whose policies these court rulings were overruling, attempted to increase the size of the Supreme Court in response to the court’s actions. His hope was to add additional justices, with beliefs similar to his own, to the current slate of justices to get more favorable rulings in the future. Although Roosevelt’s court packing scheme failed, a strong message was sent to the court. Some justices shifted their voting, and others retired, giving Roosevelt the opportunity to fill those vacant positions.^[14]

Since these three cases, the court has been much more accepting of congressional delegations of power, and in many cases, these delegations have been much broader and with less guidelines than the ones in the New Deal cases. The gradual acceptance of delegation made it clear that administrative agencies would play a much larger role in the development of public policy. This was not lost on Congress, which in 1946 passed the Administrative Procedure Act as one tool to control

the expanding power of agencies brought on by delegation and the use of the rule-making process.

The 1960s and 1970s saw another large increase in federal government involvement as Congress passed a wide range of regulatory laws focused on areas of public health, safety, and the environment. Laws such as the Clean Air Act, Consumer Product Safety Act, and the OSHA all delegated a tremendous amount of policy-making authority to the administrative agencies responsible for carrying out these laws. The vagueness and lack of guidelines associated with these laws is quite telling in the delegation controversy. For example, the OSHA directs the Secretary of Labor to issue regulations that requires employers to protect their workers “to the extent feasible” from harm in the workplace. This delegation provides OSHA with a wide range of options in which to interpret and implement the law. In the Supreme Court case of *Industrial Union Department, AFL-CIO v. American Petroleum Institute*,^[15] otherwise known as the *Benzene* case, this form of delegation was called into question by one of the justices in the majority. Justice Rehnquist believed that the statute represented an unconstitutional delegation of authority to the secretary. He restated his position in another case involving an OSHA rule, *American Textile Manufacturers Institute v. Donovan*.^[16] Although, the concern over a overly broad delegation was not the basis of the Supreme Court’s ruling on these cases, the issue of what constituted an appropriate delegation was once again being raised by the court.

The election of Ronald Reagan and then George H. Bush also led to the appointment of more conservative Supreme Court justices that would likely be more receptive to the idea of the non-delegation doctrine. Although those opposing broad delegations of power to agencies would perhaps have reasons to cheer when you examine the current Supreme Court, it has to date not gone so far as to reinstate the non-delegation doctrine and has also upheld congressional delegations. The court continues to follow a principle in administrative law that if Congress does not speak clearly about a particular policy, then a wide latitude is provided to agencies in their interpretation and implementation of the law. Such was the case in *Chevron U.S.A., Inc. v. NRDC*, where the court allowed for the Environmental Protection Agency’s interpretation of what constituted a stationary source, as discussed in the Clean Air Act.^[17] However, if Congress is clear on issues of agency jurisdiction, then Congress has the last word.

This last point was the issue in a Supreme Court case *Food and Drug Administration v. Brown and Williamson Corp.*, where the Food and Drug Administration (FDA) attempted to regulate tobacco products under the authority granted to it by the Food, Drug,

and Cosmetic Act.^[18] The court ruled that Congress was clear in developing the jurisdiction of the FDA in that it did not have the authority to regulate tobacco. Although the basis of the ruling is not specifically an issue of undue delegation, it is clear that the result of the ruling limited the FDA’s authority in interpreting a statute as they see fit. In fact, news accounts of this court ruling explicitly discussed the issues of delegation and agency power in their reporting and also referenced another court case concerning the role of delegation more specifically.

This second case dealt with the EPA’s ability to set clean air standards under the authority granted to it by the Clean Air Act. Upon challenge, a DC Circuit Court of Appeals struck down the agency’s ozone and small airborne particle standards under the non-delegation doctrine. The appeals court believed that EPA lacked any criteria in developing their standards and thus raised the issue of unbridled discretion. This ruling by the appeals court brought the issue of the non-delegation doctrine explicitly to the forefront on the debate. In addition, it raised some very real substantive concerns regarding environmental policy making, as well as other regulatory policy making within other agencies, because of the nature of many of the regulatory laws passed by Congress that had similar levels of non-specificity. Although it appeared that the Supreme Court might have been ready to implement the non-delegation doctrine more thoroughly upon an appeal based on past rulings and opinions, it did not do so. The Supreme Court ruled, unanimously, in *Whitman v. American Trucking Associations* that EPA’s standard-setting authority was not an unconstitutional delegation of power.^[19] In fact, one of the strongest supporters of the non-delegation doctrine, Justice Scalia, wrote the opinion of the court stating, “Even in sweeping regulatory schemes we have never demanded, as the Court of Appeals did here, that statutes provide a ‘determinate criterion’ for saying ‘how much of the regulated harm is too much.’”^[19] Although the question of what might be considered unbridled delegation may still exist, the Supreme Court still seems very willing to accept the idea of broad delegations of authority to administrative agencies and to rely on agency expertise in regards to general language such as “an adequate margin of safety.”

CONCLUSION

This article examines the issue of congressional delegation of authority from various perspectives. It explored the issues surrounding delegation, reasons why Congress has chosen to delegate power to the bureaucracy, and also the evolution of delegation

within the United States. It is clear that congressional delegation is a way of life in today's society.

Agencies are very much involved in the policy-making business due to the level of broad delegation provided to them by Congress. In fact, Stewart argued that such broad delegation is necessary for them to do their job adequately.^[20] This delegation provides the bureaucracy with the power to develop policy through administrative procedures. Although Lowi^[3,21] argued that these delegations and the use of the administrative process to make policy gives interest groups undue influence, Stewart^[22] countered by saying that interest representation is fundamental to our modern bureaucracy. Increased participation by these interests allows the agency personnel to understand what alternatives are desired. The conflict that occurs between interests ultimately leads to an agency policy.

The debate over delegation of authority will likely continue. In fact, in the *Whitman v. American Trucking Associations* case, Justice Thomas wrote in a separate opinion that he would be open to consider other non-delegation challenges. So, the court has not yet closed the door on this important constitutional and policy-making question. Therefore, we can expect to see further evolution of the delegation issue in the future.

Bureaucratic Discretion: Political Control and Influence

Scott R. Furlong

Public and Environmental Affairs, University of Wisconsin-Green Bay,
Green Bay, Wisconsin, U.S.A.

INTRODUCTION

Delegation of authority is predominant in our democratic society today. Congress, when writing laws and policies, has given the bureaucracy leeway in developing policies and regulations that interpret these statutes. Political scientists often refer to this leeway as bureaucratic discretion—the amount of control that bureaucratic agencies have in making public policy. This is an issue primarily because of the information asymmetries that arise between the bureaucracy and the elected leaders of Congress and the President. Left unchecked, many believe that the bureaucracy can use information advantages to set policy that is not what our elected institutions and, ultimately, the general public desire. (See *Bureaucratic Agencies: Delegation of Authority*, p. 225.)

This essay discusses some of the primary elements used by our elected leaders in their attempts to maintain control or to influence the decisions of agencies. Within the political arena, these controls can be placed into three major categories: administrative procedures, scientific and economic decision rules, and political oversight.^[1] Elected officials use these controls to influence bureaucratic agencies in their decisions, even though these agencies have an informational advantage. While these tools are presented as separate entities, it is important to recognize that, in many cases, they are interrelated. For example, a presidential directive that requires agencies to conduct a cost-benefit analysis on their regulatory activities is a procedural requirement to use a type of economic analysis or decision rule.

ADMINISTRATIVE PROCEDURES

Administrative procedures have been one of the primary ways in which our elected leaders have attempted to control and influence bureaucratic policy making. As bureaucratic policy making became more prevalent in the mid-twentieth century, our lawmakers recognized the potential concerns and began to develop some statutory requirements to ensure a sense of fairness and participation when dealing with issues of bureaucratic discretion. The major result of this

activity was the passing of the Administrative Procedure Act (APA) in 1946. This was an important law because of the procedures required that ensured that bureaucratic agencies could not regulate out of control. Some of the major components of the law were as follows: 1) granting the right to seek judicial review to “any person suffering legal wrong because of agency action, or adversely affected or aggrieved by agency action within the meaning of the relevant statute;”^[2] and 2) setting administrative procedures for how agencies would conduct rule making and adjudication. These two parts of the APA limited what agencies could do and allowed elected leaders and general citizens to be part of the administrative process. Agencies, in general, must follow certain procedures when developing policy, which will limit their discretion. The threat of judicial review also will make agencies think seriously about their policies and the possible impacts on individuals.

A large amount of agency policy making occurs through the rule-making process, and specifically through informal or notice-and-comment rule making. The APA requires three minimum steps when agencies conduct informal rule making. First, they must provide notice of a proposed policy. This typically occurs in the *Federal Register*. Second, agencies must provide an opportunity for interested parties to comment on these proposals. Finally, agencies must consider the comments before issuing the final regulation, which is again published in the *Federal Register*.

Kerwin comments that the core elements put forth in the APA are information, participation, and accountability, and these are basic to our democracy.^[3] Information is crucial to a democratic system and to decision making in general. The APA requires that notice be provided to the public when a rule is being developed and when it becomes final. Participation is another important element in democratic decision making. In the case of the APA, agencies must allow for the submission of written comments to any rule being developed. Finally, as mentioned earlier, the provision of judicial review ensures some element of accountability that we typically associate with the electoral process—in other words, if we as a society are not happy with our policies coming out of Congress, then we can elect someone different. While these

elements are not full protections against unbridled bureaucratic discretion, they provide a minimum level of criteria that all agencies must follow. In a number of cases, our elected institutions and the agencies have developed even more stringent administrative requirements to facilitate bureaucratic control.

As Congress increased the level of regulatory policy making in the 1970s, additional procedural elements to help control bureaucratic discretion were also provided. One concrete example of this was the passage of the National Environmental Protection Act in 1969, which required environmental impact statements for all federally funded projects expected to impact the environment. Other examples have included minimum public comment periods when conducting informal rule making, requirements for public hearings, and the maintenance of a rule-making docket.^[1]

While these procedures may appear to be mundane and neutral, the writings of McCubbins, Noll, and Weingast suggest that they are anything but.^[4] According to “McNollGast,” these procedures provide political principals, in this case Congress, with the necessary tools to help monitor and perhaps influence the activities of bureaucratic agencies. In addition, interest groups with similar parochial interests will benefit from these procedures. The passing of the National Environmental Protection Act provides such an example. Organizations and politicians were interested in affecting programs from a number of different policy areas, and this procedural law gave them entrée and influence into these decisions. Requiring longer public comment periods provides similar benefits to organizations that may have had difficulty responding to a solicitation of comments from an agency in a short period of time.

So, administrative procedures have been an important tool in controlling bureaucratic discretion and influencing agency decision for a number of years. These procedures establish boundaries as to how much leeway agencies have in making decisions and can also push agencies to make decisions in a certain direction. In addition, they establish procedural protections to address the potential dangers to delegation of authority.

ECONOMIC AND SCIENTIFIC DECISION RULES

Another popular tool used in influencing agency decision making is the use of economic and scientific decision rules. This has been especially true in those policy areas dependent on a large amount of technical or economic expertise, such as health, safety, and environmental policy making. Examples abound in this area of discretionary control. According to Bryner, statutory requirements that impose “best available”

technology for pollution sources or that require agencies to focus on the hazards at hand regardless of the costs involved are the ways that technical analyses are used to limit agency discretion.^[1] A similar requirement by the Reagan Administration stated that agencies had to show that the benefits of the rule outweighed the cost imposed before issuing a regulation. Another way of limiting discretion is by using of science advisory boards that must review agency decisions prior to issuing policies.

One of the more common forms of analysis used, especially in recent history, has been some form of economic analysis. Typically, presidents have issued executive orders requiring agencies to conduct one type of analysis or another to justify the policies at hand. These types of analyses began in earnest during the Carter Administration, which required rules to discuss economic consequences of their alternatives. It was the Reagan Administration, though, that took the use of economic analysis to a new level.

Upon taking office, President Reagan issued Executive Order 12291, which was the most direct requirement for economic analysis of agency rules. Under the order, agencies were required to conduct regulatory impact analyses that showed that the potential benefits to society would outweigh the potential costs; the regulatory objective chosen would maximize net benefits; and among a series of alternatives, the one involving the least net cost to society would be chosen. The Office of Management and Budget (OMB) was given the responsibility of overseeing this requirement placed upon agencies. Requiring such analyses, and dictating how they were to be used, limited the agencies’ decision-making discretion by dictating the information they had to use when regulating in their policy area. Certain categories of policies were exempt from the decision-rule criteria included in the executive order (e.g., certain statutes do not allow cost to enter into the decision-making process). Even so, the writing was “on the wall” for agencies. Even for policies that were exempt from the benefit–cost decision rule, agencies collected economic data and information, and they were important elements of the regulatory proposals.

OVERSIGHT

The final major way that elected institutions can influence agency policy making is through a variety of oversight techniques. Oversight is typically associated with a function performed by the legislative branch, and in fact, oversight is usually discussed as those activities performed by Congress to ensure that the bureaucracy is following through on congressional intent. For purposes of controlling agency behavior, though, one can also consider the President as overseeing

the bureaucracy as well. Oversight demonstrates the interesting situation of an agency having multiple principals, or in other words, these agencies must respond to two different “bosses.” On the one hand, Congress provides statutory and budget authority to the agencies, but on the other, the President is the head of the executive branch and ultimately the top of the bureaucratic hierarchy. Agencies need to somehow respond to both actors.

Presidential Oversight

The President has a number of tools at his disposal to try to control and influence agency policy making. In some cases, these tools are based on constitutional powers, and in others, they have evolved as the powers of the presidency have evolved. The most common and well-known tool that a president can use is his appointment power. According to Article II of the Constitution, the President has the power to appoint officials to government offices. One typically thinks of the President appointing a secretary to a cabinet office such as the Secretary of Transportation, but these appointments are much more extensive. A president will want to appoint officials with similar ideological views in order to improve the chances of a certain agenda being followed by an agency. Ideally, such an official might be considered an extension of the president in the policy arena in question. President Reagan was especially successful in the use of his appointment power, placing people such as James Watt into the Department of Interior and Ann Gorsuch into the Environmental Protection Agency. These individuals shared Reagan’s conservative beliefs in regards to the government being too involved in regulating business. If an appointee fails to follow the presidential agenda, the president can remove that person in favor of someone more likely to follow the president’s views.^a Presidents are often concerned that their appointees will “go native,” meaning that they will take on the views of their agencies rather than the administration. This appointment power provides a tool for which the president may guard against this concern.

Another tool that a president can use is to reorganize agencies or agency functions. Restructuring agencies internally, or a series of agencies, has the effect of emphasizing or de-emphasizing particular areas of policy. So, for example, President Carter’s splitting off

of the Department of Education from what was once the Department of Health, Education, and Welfare focused attention on this area of policy. Likewise, President Nixon’s reorganization of many agencies to create the Environmental Protection Agency was an attempt to highlight this policy arena. A related organizational tool that presidents have used relates more to internal reorganization so that agency heads have more control over enforcement activities.^[1] Different interpretations of compliance and the strictness of the related penalties, where there is some discretion, will influence agency activities and impact the policy area. If regulated entities believe that agency enforcement activities will decrease or that the penalties will be less, then there is an incentive to perhaps not spend the resources necessary to comply with the policy.

Another tool at the president’s disposal is the use of the budget. Because the president and his economic staff initiate the budget process, they can send signals to agencies about policy direction. In addition, agency budgets are submitted to the OMB for their review of the dollars and the related programs. OMB will not look favorably on agency programs that are not within the framework of the administration’s agenda. OMB will likely suggest or dictate changes that influence agency policy making.

One final, but particularly valuable, form of presidential oversight and influence is the actual presidential management of rule making and regulatory policy. In some cases, rule-making management has been the result of executive orders issued by presidents over the past 30 yr (e.g., Reagan’s Executive Order 12291). In other cases, organizational structures within the executive branch have provided presidents (or their designates) with the ability to influence these agency actions (e.g., President George H. Bush’s Council on Competitiveness).

There have been a number of executive orders issued in the recent history that have been directly aimed at influencing agency rule-making behavior and outcomes. Many of these historically have dealt with the economic side of rule-making activities. In other words, President Ford required inflationary impact statements for each major rule, and President Reagan’s executive order requiring benefit–cost analysis has been mentioned earlier. These executive orders required the gathering and consideration of economic data in rule development and passage, but other executive orders have focused on different types of information. Executive Order 12612 required agencies to conduct a “federalism assessment” of their rules. Other executive orders required agencies to consider the impact of their policies on families, the judiciary process, and private property rights.^[3] These types of requirements serve at least two purposes for presidents wanting to influence agency policy making. First, they

^aPresidential removal of agency officials is allowed for executive departments but not for commissioners working for independent regulatory commissions, because commissioners serve for fixed terms and cannot be removed due to personal differences in policy direction (see Refs.^[5,6]).

may slow the rule-making activity in general, because agencies must collect and consider additional information. For the Reagan Administration, this was an important goal. Second, agencies now must use additional pieces of data to make their decisions, and the data being required affects the type of decision being made.

Upon taking office, President Clinton also issued an executive order concerning rule making and associated analysis. Executive Order 12866 superseded Reagan's 12291 but kept many of the same principles. In essence, Clinton's executive order, which is still the governing order under President George W. Bush, attempted to decrease the amount of conflict between agencies and the OMB by decreasing the number of rules needing to be reviewed, opening up the process more for public scrutiny, and allowing agencies to consider other areas besides benefit-cost analysis. Still, this executive order continues the trend of presidents using tools to get more involved in agency policy making.

Presidents have also centralized their management structures in recent history, which has led to their ability to influence agency policy. The OMB under the Reagan Administration is the best example of this centralization. OMB's Office of Information and Regulatory Affairs had the ability, theoretically, to review almost every rule making coming out of the executive agencies. These reviews, provided by the authority of Executive Order 12291, gave OMB access to all agency rule-making decisions. While Executive Order 12291 was clear in stating that OMB reviewed these regulations and did not have to approve them prior to their issuance, politically, agencies wanted the go-ahead from OMB prior to publishing the regulation in the *Federal Register*. Executive Order 12498 was another tool of presidential management that required agencies to provide OMB with a yearly calendar of regulatory activities, and hence, giving OMB the ability to see the upcoming agency agenda and to attempt to influence the agenda or the policies within that agenda. Executive review is now an accepted part of the regulatory process, and although President Clinton decreased the role of OMB in terms of the number of regulations reviewed, it is clear that no president will ever eliminate this form of review now that it has been created.

Presidents have used other managerial tools to help them control and influence agency policies. For example, President Carter created the Regulatory Analysis Review Group (RARG) to help improve the quality of regulatory analysis. President Reagan created the Vice President's Task Force on Regulatory Relief to consider the impacts of regulations on certain sectors of the economy.^[3] President George H. Bush, perhaps adopting from his past role as head of such a task force, created the Council on Competitiveness,

which was chaired by Vice President Quayle, to act as another level of regulatory review for selected, major-impact rules. All of these ad hoc councils and groups provided presidents with another tool with which they could attempt to influence agency rules, but not without some controversy. The Council on Competitiveness, for example, was harshly criticized for its lack of openness and secret meetings. Critics charged that the group was violating the APA and other procedural protections when having their discussions.^[7] Of course, it did not help when it was revealed that the interest groups that appeared to have entrée into the Council happened to be strong financial and electoral supporters of the Bush Administration.

The president has a number of formal and informal tools to help influence and control agency policy making. These tools have become more prevalent during the past 30 yr with the growth of the administrative presidency. During this growth, presidents have taken their role as the chief administrative officer very seriously.

Congressional Oversight

Congress also has a series of tools available to influence and control agency policy making. From the congressional standpoint, oversight is important, because it is their way of ensuring that the policies coming from the agencies are consistent with the statute initially passed. Scholars have paid much more attention to the area of congressional oversight vis-à-vis presidential oversight. Given the other duties of Congress and the personal preferences of the members, many believe that there is not much time left for congressional oversight. Others have found oversight to be prevalent, if not by the congressional members, then by the committee and personal staff of the members.^[8,9] Still others may argue that we may need to think about what types of activities constitute oversight.^[10]

Congress has many oversight tools at its disposal. One of the more common is the use of a committee or subcommittee hearing. These hearings can examine a number of different elements regarding agency activity or programs, such as whether the programs are working correctly, the budgetary issues surrounding the program, or even the efficiency of the program. While it is typical to think of oversight as occurring after the fact, it is important to recognize that committees may call hearings in order to give direction or preferences of ongoing policies. In either case, Congress has the ability to send signals to an agency about what its members would like to happen in a policy area.

Another form of this type of oversight is when Congress asks for an investigation or evaluation of an agency or its programs. The Government Accountability

Office (GAO) will often conduct such a study and then report to the committee or subcommittee that made the request. This investigation will provide more detailed information about the program that Congress will focus upon in another committee hearing with the agency.

Much congressional oversight occurs informally. Members and their staff may make phone calls, have meetings, or provide some passing commentary to agency personnel. Of course, these forms of oversight are outside of public scrutiny and can always be backed up by other, more formal, oversight tools.

Agencies will respond to oversight due to many of the formal tools discussed earlier, in addition to some others. As discussed in the presidential oversight section, budget power is shared between the President and Congress, and so Congress may turn toward the budget as a way of influencing agency policy. Increases or decreases in agency budget could send strong signals to agencies in regard to the policies they are implementing. Of course, Congress' legislative power provides, in many ways, the ultimate form of oversight. The initial enabling statute that provides agencies with their statutory authority can influence and control agency behavior. The earlier section on administrative procedures discussed some of the procedural requirements Congress has placed within certain statutes. Congress has also used statutory deadlines as a way to force agency action by a certain date. And "hammers"—provisions that take effect if an agency fails to act by a certain date—have been used. A more specific piece of legislation will also dictate certain policy directions. Theoretically, if unhappy with an agency policy, Congress can attempt to pass a law that overrules the agency.

This last comment about overruling an agency policy brings up the issue of the legislative veto. For a number of years, Congress included in some statutes the ability to veto or disallow an agency action before it went into effect. The Supreme Court in *Immigration and Naturalization Services v. Chadha* ruled the legislative veto unconstitutional due to separation of powers and bicameralism violations.^[11] The legislative veto was a potentially powerful management tool that Congress created, because it allowed broad authority to be delegated to administrative agencies but still provided Congress the ability to stop an action with which it was uncomfortable.

Since the Supreme Court's ruling in *Chadha*, Congress has attempted to recapture some of its ability to prevent agency policy with which it disagrees. In 1996, Congress passed the Congressional Review Act (CRA) as a way to circumvent some of the concerns stated in the Court's ruling. The CRA provides Congress with oversight ability, not with a legislative veto, but rather with a "report-and-wait" provision. A report-and-wait provision is one in which the agency

provides Congress its proposed action and gives Congress the opportunity to review the action before it becomes effective and to pass legislation barring its effectiveness if Congress is dissatisfied with the agency action.^[12] The CRA states that Congress can bar the effectiveness of an agency action with the passage of a joint resolution presented to the President for signature. The CRA had not been invoked until the election of George W. Bush as president, when Congress used it to review and prevent regulatory actions passed during the waning days of the Clinton Administration. It would appear that the only time this act might be used to stop an action would be during this transition phase, or if there was a large majority within Congress not from the president's political party. Symbolically though, a member of Congress may threaten to invoke the law as a way of pressuring an agency decision.

CONCLUSION

Many are concerned about the issue of bureaucratic discretion and the ability of agencies to develop policy. In many ways, the primary issue is that unelected bureaucrats are making policy, and they are not beholden to the people of the United States through an electoral process. In addition, information asymmetries provide an advantage to the specialized agencies compared to the elected leaders who tend to be generalists. But, as this article has discussed, our elected leaders have traditionally had a number of avenues in which to control these unelected officials, and over the past 50 yr, have developed additional ways to influence agency policy.

Administrative procedures, economic and scientific decision rules, and statutory requirements are a priori tools available to give direction to agency decisions as they are being made. In the event these fail to persuade agencies, there are a number of post hoc mechanisms available to Congress and the President to bring an agency or its policies in line after the fact. Will every agency policy receive the ultimate amount of scrutiny from the political principals? No, but we should have some assurance that those areas especially important to the elected leaders and their constituency groups will be adequately monitored and changed if necessary.

Bureaucratic Politics

Gene A. Brewer

Athens, Georgia, U.S.A.*

INTRODUCTION

Bureaucratic politics occurs when bureaucrats, who are non-elected government officials, enter the political arena and try to influence or shape the policy-making process. In most cases, this process is characterized by conflict and bargaining as multiple actors vie for control of the same policy space. Most theories of bureaucratic politics portray bureaucrats as self-interested and self-serving individuals who steer policy decisions in directions that protect and advance their personal interests and those of their employing agencies.

THE RISE OF BUREAUCRATIC POLITICS

Politics and administration have always been messily intertwined, but this fact has not always been clear. The rise of bureaucratic politics in the United States is a good case in point. During the Progressive era, the academic field of public administration was born, and government was reformed on the premise that politics and administration are separate spheres. However, this make-believe separation became strained and was finally rejected in the 1940s when the nation experienced two successive crises of global magnitude: the Great Depression and World War II. The scope and severity of these crises required the best efforts of political leaders and public administrators working in tandem. Thereby, scholars and practitioners discovered that politics and administration are one, and that this can be a good thing.

Since then, two broad streams of research have spotlighted the relationship between bureaucratic agencies and other participants in the policy-making process. The first stream of research has investigated the relationship between bureaucratic agencies, client groups, and special interests, while the second has focused on the relationship between bureaucratic agencies and overhead political actors such as the president and Congress. These two streams of research are described in more detail below.

Bureaucratic Agencies, Client Groups, and Special Interests

In the post-war years, scholars described bureaucratic politics as a process in which officials and agencies

become “captured” by client groups and other special interests. For example, David E. Lilenthal explained that organizing and managing the Tennessee Valley Authority (TVA) was essentially a political enterprise, and Phillip Selznick described how TVA cultivated political constituencies to accomplish its mission and ensure its survival.^[1-2] Selznick labeled this process “cooptation”—a Faustian-type bargain in which agencies receive political support from client groups and special interests by giving them a voice in the agency’s decision-making process.

These types of alliances often turned into “iron triangles”—cooperative relationships between an agency, legislative committee, and interest group. The opportunities for quid pro quo in such a relationship are obvious, as members of the legislative committee receive political support from the pressure group, while providing favorable legislation and funding to the agency. These iron triangles seemed ironclad: they dominated specific policy areas to the extent that even presidents could not penetrate them.

In the 1960s and early 1970s, economic deregulation and liberalizing social changes in American society made iron triangles and agency capture theories seem somewhat outdated. Hugh Heclo observed that iron triangles were giving way to “issue networks,” which he described as loose alliances between agencies and other parties interested in a particular policy or issue.^[3]

Bureaucratic Agencies and Overhead Political Actors

Meanwhile on the political front, there was growing concern over the president and Congress’s ability to control the bureaucracy. This concern was exacerbated during periods of divided government, which prevailed after 1968. For example, the Nixon Administration feared that liberal bureaucrats would side with Congressional Democrats and sabotage Nixon’s conservative policy agenda. Thus, the administration mounted an aggressive campaign to regain political control of the bureaucracy.^[4] Their strategies included applying litmus tests to presidential appointees and weakening the career civil service by bending merit system rules.^[5] This battle for control of the bureaucracy grew fiercer in the Carter and Reagan Administrations. President

Carter secured passage of the Civil Service Reform Act of 1978, making the bureaucracy more accessible and vulnerable to overhead political control. President Reagan seized this opportunity to protect and advance his conservative policy agenda: he significantly increased the number of political appointees, further politicized the appointments process, and instituted policy reforms that weakened the career service in most regulatory, social service, and central management agencies.^[6]

Scholarship on bureaucratic politics increasingly reflected this concern about bureaucratic control. Researchers from several different academic fields began applying the principles of neoclassical economics to the problem. Most of these treatments suggested that bureaucrats and their agencies were on a feeding frenzy, acting in their self-interest rather than the public interest.^[7] One particular application—principal-agent theory—has become quite influential in recent years.^[8] Studies using this framework have shown that elected officials can exert control over bureaucratic outputs, but that doing so is costly and time-consuming. Excessive overhead political control seems to breed bureaucratic inefficiency.^[9]

In the United States, politics and administration have always been intermingled, and bureaucratic politics has always been an important part of the policy-making process. This fact was made clear in the 1940s, when elected officials and bureaucrats worked together to rescue the nation from economic bankruptcy and despotism. Ironically, scholarship on bureaucratic politics has become increasingly disconnected from this heroic era.

SCOPE OF BUREAUCRATIC INFLUENCE

According to James Q. Wilson and John J. DiIulio Jr., three features of the American political system make American bureaucracy distinctive. These features also promote bureaucratic politics: first, political authority over the bureaucracy is shared between the executive, legislative, and judicial branches; second, agencies at the federal, state, and local levels often share functions; and third, the American political system is adversarial in nature. In this highly charged political environment, bureaucratic politics is likely to thrive.^[10]

Most observers agree that bureaucrats' preferences are important, and that their behaviors are consequential. Yet the extent of bureaucratic influence in the policy-making process is not always clear. Francis E. Rourke contends that bureaucratic influence has declined in recent years. He says the main culprits are divided government, transformed constituencies, and increased policy volatility.^[11] Robert F. Durant disagrees in part. He provides numerous examples

showing that bureaucratic influence is alive and well in some quarters, and he concludes that it is highly variable. Durant lists more than a dozen factors that affect the degree of bureaucratic influence. These factors include individual and organizational attributes, type of constituents, and variables describing the policy arena and political environment.^[12] Both authors are probably correct. Bureaucratic influence has declined in recent years, but it remains quite potent in certain situations and may reassert itself in the future.

SOURCES OF BUREAUCRATIC POWER

Bureaucrats exercise considerable discretion in the modern democratic state. This fact is inevitable and desirable. It is inevitable because administration is about exercising discretion. Even if bureaucrats choose to be neutral, they are electing a course of action with sure and important consequences. Bureaucratic discretion is desirable, because elected officials need help. Bureaucrats have the expertise to provide this help, and they are strategically situated. That is, they work in close proximity to the problems elected officials face and the people they serve.

Bureaucrats also wield considerable influence in the policy-making process. They make many decisions in their own right and work behind the scenes to influence others. In fact, bureaucratic influence is found in every stage of the policy-making process. Bureaucrats help set policy agendas, frame issues, formulate alternatives, calculate costs and benefits, secure funding, make decisions, and implement those decisions. Furthermore, bureaucrats are involved in policy evaluation and provide crucial feedback to policy makers.

Political scientist Norton E. Long once explained that "power is the lifeblood of administration."^[13] To be effective, bureaucrats must enter the political arena and take an active role in the policy-making process. The bureaucracy is a political institution just like the president, Congress, and the Supreme Court. Kenneth J. Meier explained: "It must build political support for its actions, and it uses that political support to interact with other political institutions to make public policy."^[14]

There are many other sources of bureaucratic power. In the American political system, governing coalitions come and go. Yet the bureaucracy is relatively permanent. Bureaucrats administer programs and execute laws that are the cumulative legacy of past and present governing coalitions. Thus, the bureaucracy has a vivid institutional memory that spans several hundred years of self-government. Its stability and permanence, and the continuity it provides, are primary sources of bureaucratic power.

Francis E. Rourke emphasized the ability of bureaucrats to mobilize political support and lend professional expertise.^[15] James Q. Wilson contended that bureaucratic power is dependent on the type of task an agency performs and the ease of monitoring its operations and activities.^[16] Kenneth J. Meier provided yet another view. He explained that resources and autonomy are the two principal sources of bureaucratic power, and that this power can be enhanced or diminished by the type of policy environment, level of political and public support, specialized knowledge, cohesion of bureau personnel, and skill of bureau leadership.^[14] In sum, there are many sources of bureaucratic power, and its exercise is situation-dependent.

BUREAUCRATIC MOTIVES AND THE “AGENCY VIEW”

An important part of bureaucratic politics is the belief that officials are motivated primarily by self-interest and tend to promote their agency’s view on most policy issues. The notion that individuals and their employing agencies have similar interests comes from Mile’s Law: where you sit determines where you stand. Bureaucrats want to keep their jobs, advance their careers, and increase their budgets. Their agencies are likely to have similar goals: they want to maintain their current staffing levels, extend their jurisdiction and reach, and increase their budgets.

Another reason bureaucrats tend to have an agency orientation is that they spend most of their careers in a single agency. After years of indoctrination and investment in the agency, they naturally come to embrace its cause.

So far, the study of bureaucratic politics has been dominated by the assumption that bureaucrats are self-interested and self-serving, and that their agencies are similarly motivated. One of the most promising avenues for future research is to relax this assumption and recognize other important motives. These motives may include the desire to perform meaningful public service and to protect the public interest.

AN EXAMPLE: THE CUBAN MISSILE CRISIS

In his classic study of the Cuban Missile Crisis, Graham T. Allison examined the decision-making processes of the United States and Soviet governments during the tense international standoff that occurred in October 1962.^[17–18] Allison used three “conceptual lenses”: the rational, organizational process, and bureaucratic politics models. Thus, his study is particularly enlightening because it compares and contrasts the bureaucratic politics model with the two other models.

Summary of Events

The Cuban Missile Crisis was the most dangerous U.S.–Soviet confrontation of the Cold War. After the U.S.-sponsored Bay of Pigs incursion failed to depose Cuban Premier Fidel Castro, relations between the two nations steadily worsened. In October 1962, a U.S. reconnaissance flight discovered that the Soviet Union was secretly building ballistic missile launch sites in Cuba—approximately 100 miles from the Florida coastline. President John F. Kennedy was informed on the morning of October 16, and he immediately called the first of a series of meetings with his top advisors. After several days of gut-wrenching deliberations, Kennedy decided to impose a naval blockade on Cuba. He simultaneously warned Soviet Premier Nikita Khrushchev that any missile launches from Cuba would prompt a full-scale U.S. retaliatory attack against the Soviet Union. Khrushchev called the naval blockade “an act of aggression which pushes mankind toward the abyss of a world nuclear war.” On October 24, Soviet ships carrying missiles to Cuba approached the quarantine line. After several tense hours, the Soviet vessels turned back averting a direct military confrontation. Soon afterward, Khrushchev ordered the missile sites dismantled and the missiles removed from Cuba. Thus, the 13-day crisis ended.

The Rational Actor Model

The rational actor model assumes that states are unitary actors, and that they make rational decisions. Two types of rationality are possible: procedural and substantive. Procedural rationality focuses on the decision-making process. This process consists of the following steps: defining the problem, searching for alternatives, estimating the costs and benefits of each alternative, and finally, selecting the best option. In contrast, substantive rationality focuses on the result. The preference of the decision maker can be inferred from the outcome, as all actions are viewed as intentional.

In the present case, Kennedy and his advisors tried to utilize the rational model. They searched for alternatives and identified several: an Army invasion of Cuba; an Air Force attack on the missile sites; a naval blockade to prevent missiles from entering Cuba; a State Department diplomatic protest; and simply ignoring the situation because it did not change the overall balance of power. Each alternative was evaluated against a set of criteria that included potential loss of American lives; monetary cost; probability of starting a nuclear war; domestic political fallout; and others. After careful study, Kennedy decided that the most prudent course of action was his twin response: a naval

blockade of Cuba and the threat of massive retaliation against the Soviet Union. Thus, viewing the decision-making process through the rational model lends important insights.

The Organizational Process Model

Next, Allison considered the organizational process model. All large organizations develop bureaucratic structures and decision rules to avoid uncertainty and improve their decision-making ability. These structures and rules represent organizational learning from past successes and failures, and they provide continuity in the event of employee turnover. That is, bureaucratic organizations use decision rules and link decision-making power to offices rather than particular individuals.

The main difference between the rational and organizational models is in how the decision-making process is depicted. The rational model assumes that individuals go through the lengthy process of winnowing down alternatives and arriving at the one-best-solution. The organizational process model counters that rules—often referred to as standard operating procedures (SOPs)—guide decision making. Many participants with different preferences are involved, but they usually unite behind the SOP.

Allison provided the following example. President Kennedy ordered a naval blockade to prevent the Soviets from shipping more missiles into Cuba. Defense Secretary Robert McNamara wanted to draw the quarantine line close to the Cuban coast. He felt that a “tight blockade” would reduce the chances of a U.S.–Soviet confrontation. However, the Navy’s SOP called for a more relaxed 500-mile quarantine line. Such a line would serve several purposes for the Navy. It would increase their chances of intercepting ships headed for the coast and give them ample space to maneuver away from hostile naval forces and thwart air attacks from the mainland. Even though McNamara ordered the Navy to implement a tight blockade, they did not heed his order. The type of blockade was determined by the Navy’s SOP. Thus, the organizational process model provides important insights about the decision-making process.

The Bureaucratic Politics Model

The bureaucratic politics model (Fig. 1) emphasizes that many officials are involved in policy decisions, and their preferences are derived from their organizational backgrounds. The Secretary of the Army will stress the Army’s position in interexecutive bargaining, while the Secretaries of the Navy and Air Force will represent their respective service branches. Hence,

Fig. 1 The bureaucratic politics model of decision making. In the bureaucratic politics model, the decision-making process is characterized by conflict and bargaining. The participants engage in a “tug-of-war” trying to steer policy in the direction they prefer. Imagine two participants with equal power tugging in different directions (lines A and B). The outcome is what Allison called the “resultant” (line C).

the decision-making process involves multiple actors with different preferences, and it is marked by conflict and bargaining. The participants engage in a “tug-of-war” to pull policy toward their preferred outcome. Allison called the final decision a “resultant.”^[19–20]

During the Cuban Missile Crisis, many different groups were involved in the White House decision-making process: the Defense Department, State Department, Joint Chiefs of Staff, Central Intelligence Agency, and others. These actors had different preferences, largely because of their formal roles and agency ties. Furthermore, some had more influence than others. For example, Attorney General Robert F. Kennedy was highly influential because he was President Kennedy’s younger brother and close confidant.

An intense tug-of-war ensued. Defense Secretary McNamara originally proposed a “do nothing” option, but the President deemed this response politically unacceptable. A hard-line coalition led by the Service Chiefs, former Secretary of State Dean Acheson, and others emerged and pushed for a surgical air strike. McNamara opposed this option and countered by proposing a naval blockade. He convinced the Attorney General and Presidential Counsel Ted Sorenson to support his plan. In the end, this moderate coalition prevailed.

Allison said the decision-making process was a bargaining game, and the participants knew it. They formed strategic coalitions and entered the fray. The outcome was a political result hammered out by these coalitions. Allison explained that even when an outcome is mostly the triumph of one individual or group, bureaucratic politics may help explain the context and inner workings that made the victory possible.^[18]

	Rational Model	Organizational Process Model	Bureaucratic Politics Model
No. of Actors	One	Many	Many
No. of Preferences	One	Many (United)	Many (Divergent)
Decision-Making Process	Rational	According to Rules and Procedures	Via Conflict and Bargaining
Outcomes	Intentional	Pre-Determined	Resultant
Major Drawbacks	Hard to Attain	Not Very Flexible	Hard to Predict

Fig. 2 Comparison of Allison's three models of decision making.

In conclusion, the rational model assumes that states are unitary actors with fixed preferences. Officials acting for the state try to maximize the state's utility by making decisions rationally. The organizational process model assumes that each organization has unique preferences and that decisions are made according to predetermined bureaucratic routines called SOPs. The bureaucratic politics model assumes that decision makers have a unique set of preferences derived from their positions in government and that the decision-making process is a tug-of-war between these individuals. Overall, the bureaucratic politics model seems more plausible than the other two models because it conveys the dynamism and "real politik" of the policy-making process.

Fig. 2 summarizes the key differences between these models.

In the end, Allison is not advocating one best approach. He suggests using a variety of conceptual lenses.

CRITIQUES OF BUREAUCRATIC POLITICS

Theories of bureaucratic politics are limited for several reasons. First, Mile's Law does not always hold true. Officials are not always self-interested and self-serving, and they do not always promote their agency's view on important policy issues. Second, the model does not lend itself to making predictions. Third, bureaucratic politics raises the important question of bureaucratic accountability in democratic government.

How can we be sure that bureaucrats, who are non-elected government officials, will subordinate their self-interest and act in the public interest? This question is the Achilles heel of modern-day public administration,

and it seems to defy any simple answer.^[21] Most contemporary thinkers contend that a combination of internal and external control mechanisms is the best strategy. Accordingly, bureaucrats are urged to act responsibly, and they are monitored by overhead political officials.

CONCLUSION

The term bureaucratic politics has several different meanings in the literature. These meanings vary from the narrow decision-making model described by Graham T. Allison to the broader, more encompassing notion of bureaucratic influence on policy making described by political scientists Francis E. Rourke, James Q. Wilson, and Kenneth J. Meier. Another stream of scholarship portrays bureaucrats and their agencies as threats to the public interest. Thus, this portrayal casts a negative light on bureaucratic politics. Overall, these various perspectives have several things in common. They all acknowledge that bureaucrats have a significant amount of discretion, and that these officials are active participants in the policy-making process.

Accordingly, bureaucratic politics emphasizes that bureaucrats, who are non-elected government officials, enter the political arena and try to influence or shape the policy-making process. These officials are assumed to be self-interested and likely to promote their agency's view on specific policy issues. That is, they are expected to protect and advance their own interests when engaged in inter-executive or inter-agency competition. As a result, theories of bureaucratic politics suggest that policy outcomes are the result of conflict and bargaining rather than the more rational or incremental processes described elsewhere.

Bureaucrats and Politicians in Southeast Asia

Scott Fritzen

Public Policy Programme, National University of Singapore, Singapore

INTRODUCTION

Ever shifting relationships between bureaucrats and politicians have played a direct or indirect role in several major debates in Southeast Asia since colonization. One theme concerns the *contradictions of the colonial inheritance*, with its ideology of a politics–administration separation coupled with extreme executive dominance in practice. A second theme involves the role of the bureaucracy in *promoting economic transformation* in several Southeast Asian states modeling themselves after the successful newly industrialized countries (NICs). Finally, more recent calls for good governance in the wake of the East Asian financial crisis coupled with democratization trends in the region have raised the salience of the concept of *democratic accountability* of both politicians and bureaucrats. This review examines each of these areas, concluding that the dynamics of the bureaucrat–politician relationship are likely to continue to be a central point of theoretical and practical contestation in the coming years.

THE COLONIAL LEGACY

A seminal concept dominating the “modern” democratic notion of the bureaucrat–politician relationship harkens back to Woodrow Wilson’s politics–administration dichotomy: “The field of administration is a field of business ... removed from the hurry and strife of politics” (1887, quoted in Ref.^[1]). Both politics and administration, it was understood, were to be underpinned by accountability to the public and to the rule of law. This normative ideal, whatever the realities in the home country context, did not travel well to Europe’s Southeast Asian colonies. There, the appointed (European) “man in the field” was the ultimate bureaucrat-cum-politician ruling with great discretion with no democratic accountability.^[2] This was, in practice, usually consistent with indigenous patterns of rule in kingdoms of Siam and Burma or the sultanates of the Malay Peninsula.^[3–5]

The task of crafting modern polities, whether as part of the decolonization agenda or revolutionary struggles, was one of developing and cementing elite consensus within functioning organizations capable

of commanding a sufficient degree of legitimacy and of exercising state power. This task expressed itself in different forms, depending on the contingencies of the political process. Three models are evident.

The first pattern, found in Malaysia, Indonesia, the Philippines, and Burma, involved a semisponsored, more or less orderly handover of power from the colonial authorities to a local elite. Colonial authorities looked to the civil service as the logical—often the only—source of “acceptable” nationalist leadership. In some places, these authorities explicitly endeavored to leave behind more ethnically representative bureaucracies (reversing earlier policies that favored Indians and Chinese in Malaysia, for instance) and political movements.^[6] When such promotion led, in practice, to uncomfortably close ties between aspiring politicians and bureaucrats (because of the shallow pool of politically acceptable talent that colonial administrators could tap), principle gave way to political expediency. These former colonies were left with weakly institutionalized political systems that had but a semblance of political–administrative separation—and none at all following the military coups that subsequently occurred in all of the above countries except Malaysia.

Thailand, which avoided colonization, must stand in its own category. Here, at least until recent years, a military–bureaucratic alliance dominated. The 1932 coup d’état that overthrew the absolute monarchy was motivated as much by bureaucratic–clientelistic objectives as by calls for greater modernization or democracy per se.^[4] The ensuing pattern of Thai institutional life as “a matter of competition between bureaucratic cliques for the benefits of government” (David Wilson, quoted in Ref.^[4]) remained, in some ways, institutionally consistent for several decades.

The third pattern—most costly in terms of human suffering and developmental trajectories—involved prolonged violence and instability in Indochina. It began in the immediate postwar period with the North Vietnamese struggle to unify the country under communist rule and ended only in 1993 with UN-sponsored elections initiated a decade of political consolidation and a semblance of stability.^[7] Prolonged strife, combined with attempts to implement radical socialist programs, left Vietnam, Laos, and Cambodia without a professional bureaucracy or even

rhetorical norms limiting regime powers. The bureaucracy was subsumed under the overriding necessity of developing revolutionary administrations utilizing neo-Stalinist forms of political organization.

To summarize, the internal contradictions of colonialism, coupled with the political turbulence that followed decolonization and modernization period, left bureaucracies in all of these countries (save Thailand) decisively dominated by political masters. The systems that emerged, however, varied greatly in their developmental effectiveness, for reasons explored in the next section.

THE BUREAUCRACY IN NEWLY INDUSTRIALIZING CONTEXTS

Beginning with the Japanese transformation, several East Asian countries, together with one Southeast Asian—Singapore—were able to rapidly transform their economies, attaining within some 20 years levels of per capita income that placed them in the ranks of advanced, industrial countries. Several Southeast Asian countries, which collectively became known as the new “tigers”—Malaysia, Thailand, and Indonesia—appeared to model certain aspects of the NIC’s developmental recipe and appeared to achieve considerable success in doing so.

How had the NICs achieved such a feat? This became the dominant question in practical and theoretical debates that continue to this day and in which the relationships between bureaucrats and politicians came to play a key role. Contrasting explanations were offered by those^[8,9] who advocated that the state’s role in economic decision making was decisive and others^[10] claiming that state success in achieving macro-economic stability and an external orientation was far more important than bureaucratic interventions. An influential explanation among the former group^[11,12] held that the key to developmental effectiveness, both in the NIC case and potentially in other countries, was the “embedded autonomy” of the bureaucracy. Bureaucracies could, by this theory, successfully serve as “midwives” to economic development if they enjoyed four conditions. The first was a political leadership determined to pursue a transformational agenda with little fear of electoral backlash. The second was a meritocratic, technically competent bureaucracy (or an elite, “piloting” segment of it). The third and fourth requirements were special characteristics of this bureaucracy that would allow it to successfully intervene in the economy. The bureaucracy was to be both “embedded”—enjoying dense informational links to the companies and market sectors to be promoted—and “autonomous,” i.e., not captured by any special interest and therefore being capable of “disciplining”

capital by, for instance, stopping subsidies where this was necessary.

To what extent did Southeast Asian countries put these purported conditions of success in place? Singapore, as one of the original NICs, was in many ways the archetypical example of the process. One must only make the proviso that the bureaucratic “autonomy” in question was not autonomy from the ruling People’s Action Party itself. Rather, it reflected the overall autonomy of the regime, with its technically competent bureaucrats clearly in position as “implementers” of policies.^[13,14]

Malaysia, Thailand, and Indonesia were all held up at one time or another as exemplary “new tigers” primarily because of their success in achieving, for extended periods, high rates of economic growth. Malaysia and Indonesia shared considerable regime stability (at times enforced by repression), a commitment of the leadership to economic modernization, and development outcomes that were broadly based, whether through programs of outright redistribution (as in the case of Malaysia’s New Economic Policy) or successful strategy to boost agricultural productivity (as in Indonesia).

The bureaucracy in all of these cases was thought to be reasonably capable and “technocratic.” Yet economic interventions were of a generally smaller scale than in the NICs themselves, and the “disciplining” of capital was heavily constrained by the need to promote the “illegitimate” (i.e., non-transformational) interests of the ruling clique itself, as expressed in soaring levels of corruption. Only in Malaysia did the high degree of unity of the Malay political-bureaucratic establishment consistently promote an agenda of redistribution from the Chinese economic elite to ethnic Malay majority. As shown in the next section, however, the developmental model employed by the “tigers” clearly involved less of a “steel-frame” bureaucracy than that implied by the embedded autonomy theory.

Vietnam has more recently emerged as arguably a vital member of the “tiger” community, with economic growth rates consistently among the highest in the world throughout the 1990s. Scholarly debates continue as to whether the far-reaching *doi moi* (renovation) reforms it introduced were driven by local bureaucratic responses to failed central planning or by a far-sighted central leadership.^[15] Whatever the case, the rapid growth that ensued initially reflected gains brought on by the one-off removal of “artificial” constraints on growth imposed by poor institutions (such as collective agriculture) but was later sustained by a political-bureaucratic Communist Party elite calculus that rapid growth and modernization was the best chance the party had to maintain its legitimacy.^[16] This strategy of economic reform with continued

political authoritarianism has generated some tensions in Vietnam, as it has in countries such as Singapore and Malaysia, a trend reflecting of democratic pressures for reform.

PRESSURES FOR REFORM: THE GOVERNANCE AGENDA COMES OF AGE

The last 15 years or so have seen a shift in the parameters of the debate over the politician–bureaucrat relationship throughout Southeast Asia. Two overlapping categories of influence are particularly important in this context: democratization and the rise of the “good governance” agenda.

Calls for greater political accountability have been on the increase throughout the region. A “third wave of democratization”^[17] saw civilian, multiparty rule return in Thailand (1992), Philippines (1986), Indonesia (1998), and Cambodia (1993). Public anger over the closed workings of the political–bureaucratic elites dominating the first three countries was a key factor in bringing down autocratic rulers. This increased mobilization and citizen consciousness has carried over into democratic politics in these countries; use of the bureaucracy for the enrichment of the political elite continued to feature prominently in calls for both political and bureaucratic reform in several contexts, for instance, the ouster of President Joseph Estrada during “People’s Power II” (2002) and more positively, in the introduction of an ambitious new constitution in Thailand in 1997. Citizens throughout the region showed themselves eager and willing to envision democratization as a check on both unaccountable political and bureaucratic power.

In Singapore, Vietnam, Laos, and Brunei, governance remained both authoritarian and (for practical purposes, although via very different mechanisms) uncontested, whereas in Myanmar (Burma), a small group of generals continued to block any political normalization. Even here, the *ersatz* vocabulary of democratization—articulated in terms of improved governmental responsiveness to citizen feedback—was an increasingly prominent feature in officially sanctioned political discourse, although practical reform efforts betrayed the significant contradictions of their contexts. For instance, Singapore’s establishment of district-based “Community Development Councils” in 1996 was touted as an attempt to promote greater citizen involvement in local decision making, despite the fact that council members were all appointed by the ruling party.^[18] In Vietnam, much-hyped “grassroots democratization” reforms introduced in 1997, in practice, meant a clarification of standards (e.g., regarding local government budget transparency) that higher levels of the party-state

apparatus could use selectively to “discipline” lower levels.^[16]

The “good governance” agenda that arose contemporaneously with the democratization movement above was given impetus primarily from donors, academic work highlighting the impact of governance qualities on development outcomes, and various think tanks and non-governmental organizations. One variant of the agenda, driven by increasing financial integration of the region, was concerned corporate governance. Explanations for the Asian financial crisis beginning in 1997, which afflicted Indonesia, Thailand, and the Philippines more than other Southeast Asian countries, came to center on a pernicious set of incentives—of politicians to use capital markets for personal purposes; of banks to lend funds for unsound investments; and of bureaucratic regulators to overlook all of the above.^[19] The financial crisis led to a fundamental reassessment of the supposed strengths of the region’s political–bureaucratic systems. More specifically, the call was for greater transparency and disciplined oversight systems that reinforced the call for a clear separation of bureaucratic from political authority and for both to be underpinned by a reinforced rule of law.

Another “good governance” agenda lies in the promotion of decentralized decision making and management, whether in a democratic, fiscal, or administrative context. Here there was also much to discuss on the regional scene, with virtually all countries in the region engaged in some form of formal decentralization policy. For most countries, this went beyond rhetorical support for the concept as an ideological smokescreen. In Cambodia—arguably the least hospital environment for devolution in the region—authorities astounded observers with the speed with which it established democratically elected Commune Councils, even before presumably easier administrative reforms supporting such arrangements were in place. Through the rapid introduction of two decentralization laws (Nos. 22/1999 and 25/2000) in the immediate aftermath of Soeharto’s resignation, Indonesia moved “from being one of the most centralized countries in the world to one of the most decentralized.”^[20] Thailand and the Philippines both continued to decentralize decision making to provinces and districts, the latter quite vigorously.^[21]

There is, finally, a managerialist variant of the good governance agenda. The New Public Management (NPM) can be seen as an attempt to reengineer relationships between politicians, bureaucrats, and the public.^[22] Key strategic elements in this broad family of reforms include: 1) delinking policy formulation (or “steering”) from implementation functions to concretize the specific accountability borne by all actors; 2) introduction of competitive pressures to the

bureaucracy using market mechanisms such as privatization where possible and systems of performance measurement where not; and 3) deregulation of internal operations to promote flexible, creative implementation.^[23] Application of such ideas to developing country contexts, where the predictability and transparency of bureaucratic processes is limited, has been hotly contested.^[24] But attempts to apply NPM principles to governance reforms are standard policy in the higher capacity countries covered here (Singapore and Malaysia), increasingly, if hesitantly, being applied in the newly democratic countries of Southeast Asia and are prominent in public administration reform strategy.

CONCLUSION

In the aftermath of colonialism, bureaucratic-politician relationships were, like government systems themselves, weakly institutionalized in Southeast Asia, regardless of whether they had inherited the ideological veneer of a politics-administration dichotomy. The “tigers” of Southeast Asia were able to grow quickly by drawing on a combination of transformational leadership, an external orientation, and core bureaucratic agencies of at least moderate capacity. The politician-bureaucrat relationship was driven in these cases by a substantial unity of elite interests (as in Malaysia) or domineering executives or parties (as in the Philippines, Indonesia, and Vietnam). Political systems were, in many cases, highly fragile and, in others (such as Myanmar), rigid but non-transformative; in all cases except Singapore and possibly Malaysia, however, bureaucratic capacities and incentives fell well beneath the threshold levels of “embedded autonomy” that theorists argued were necessary to sustain economic transformation over a period of not years but decades, as in the newly industrialized countries.

Democratization and good governance pressures, driven by the increased sophistication of societies and by global financial integration, have propelled the politics-administration link into the center of political discourse throughout the region. In a few countries (notably Myanmar, Laos, and Brunei), there is no discernable movement toward a more institutionalized, professional bureaucracy. Other authoritarian contexts (such as Singapore and Vietnam) are attempting to make their bureaucratic systems more responsive to their publics without threatening (indeed, while bolstering) the position of ruling elites. In more democratically competitive settings, a wider range of reforms—from formal regulation of civil servants via asset disclosure requirements to democratic decentralization to increase the direct accountability of service providers and local politicians to the public—is being

introduced. Capacity to implement such ambitious reforms is, in all cases, limited. The outcomes of attempts to establish transparent relationships between politicians and bureaucrats, where these have never sat easily within the region’s political economy, will be hotly contested in the years to come, both theoretically and on the ground.

Burnout in Public Agencies

Robert T. Golembiewski

Department of Political Science, University of Georgia,
Athens, Georgia, U.S.A.

INTRODUCTION

A favorite metaphor involves efforts to add tension to a system to energize it, which requires fine-tuning short of that point at which the system becomes overloaded and “snaps.” In this elemental sense, organizations are like rubber bands propelling a spitball. Increase the loading on the band by extending it, *but not too far*, and the missile will go further and faster. Apply too much loading, and the rubber band will just pop into two or more pieces, and that may sting the shooter rather than provide momentum for the projectile.

Some such metaphor underlies most downsizing or rightsizing. For example, a system is seen as having too many human resources, or the wrong kinds, and the goal is to eliminate some employees while increasing the workload of those who remain. All too often, however, the human system may be deteriorated in the process (e.g., Ref. ^[1]).

This common elemental fine-tuning strategy is not guaranteed to “work,” far from it, in fact. Guidelines exist for seeking that magical middle ground, where systems become more energized (e.g., Ref. ^[2]) and also avoid the breaking point. Failure can be costly, nonetheless, and perhaps is so in the majority of cases. Witness violence at the work site, which seems more and more a hallmark of our age. Frequently, these outbursts can be traced to a person or persons under stress, tragically beyond the point at which they “snap,” or “go around the bend,” emotionally speaking. In the most dramatic form, someone turns gunfire on fellow workers, on specific targets as well as those unlucky enough to be in the wrong place at the wrong time.

The burnout literature takes us a substantial distance toward isolating such “breaking-points” in practice, although we are not yet there. In the opinion of this author, and he has a clear vested interest (e.g., Ref. ^[3]), the “phase model of burnout” is the farthest along of several possible developmental models. A few details suggest the nature and range of support for this view.

PHASE MODEL OF BURNOUT

After a decade of development, the phase model permits a number of confident generalizations. In turn, six points will receive emphasis below:

- Conceptually, we have a solid idea of how to define a dimension reasonably labeled “burnout.”
- Operationally, for extensive purposes, we know how to measure the incidence and severity of burnout.
- Tactically, the phases of burnout are associated with a long list of undersized and undesirable outcomes, both personal and individual.
- Burnout seems to persist over extended periods of time.
- The incidence of burnout, as seen in various contrasts, seems to fall in the range of bad to worse.
- In general, incidences of burnout do not seem to vary robustly and regularly, in public versus business contexts.

Normal Definition of Burnout Subdomains

Most observers generally agree that burnout is comprised of three subdomains. Following Maslach,^[4,5] individual burnout is contributed to by the following:

- High scores on items relating to *depersonalization* or the tendency to think of individuals as things or objects rather than as sensitive, valuing beings.
- Low scores on *personal accomplishment* (*reversed*), which is tapped by items relating to how well a person does on work tasks as well as on how worthwhile these tasks are seen to be.
- High scores on *emotional exhaustion*, with items relating to the emotional slack available to individuals—as coping skills and attitudes are discounted by the stressors an individual experiences at a particular point in time.

Operational Definition of Phases

Items from the MBI (or Maslach Burnout Inventory) are used to estimate the three subdomains, scores on which for each individual are differentiated as high versus low using norms based on the population of a large public agency^[3] operating under substantial stressors and strain. A median-cut on each subdomain is utilized to make the high versus low distinction.

Beyond this point, a single decision rule applies: depersonalization is seen as more virulent than personal accomplishment, and both are seen as less determinative of burnout than emotional exhaustion. Overall, each individual is assigned to one of the eight phases in Fig. 1. Note that the high versus low assignments are based on norms from 1500 respondents in a U.S. federal agency high levels of strain.

Note that one significant point that the model does not imply is that progression to full burnout must take the path I→II...→VIII for individuals. Rather, however one arrives at a specific phase, the model predicts that worsening conditions for individuals will be associated regularly with I versus II, II versus III, III versus IV, and so on.

Indeed, there seem to be two basic flight paths to advanced burnout. In *chronic onset*, the basic pattern seems to be I→II→IV→VIII. In *acute onset*, various flight paths may exist. Thus, a person suddenly losing a beloved mate might quickly advance I→V. Beyond that point, continued growing might be variously reflected in advancing burnout. For example, a person might adapt by losing interest in work, in which case, the flight path becomes I→V→VII and might then extend to VIII. Alternatively, that person might try to “lose self in work,” in which case, the pathway would be I→V→VI, ultimately with a possible extension to VIII. Recovery could variously work its way back through (perhaps) phase I, in the cases of chronic and acute onset.

In sum, the burnout phases progress from least advanced→most advanced, or phase I→VIII, but not in a simple and sovereign progression. In sum, an VIII strongly tends to objectify personal relationships, believes self to be doing poorly on a task with little socially redemptive value, and experiences only a slight positive balance, if not an actual deficit, in the stressors

experienced as contrasted with coping skills and attitudes for dealing with them.

The overall results, in North America and world-wide, suggested that their distribution needed close attention.^[6] Only Phases I→VIII are regularly and robustly associated with a broad range of worsening conditions, phase by phase. In addition, 40% or more of all employees are assigned to Phases VI→VIII, which indicates a large proportion of “burned-out” individuals.

Phases as Breaking Points

The phases do not provide a map of the specific point when strain becomes “too great,” but the model nonetheless has tolerable utility. Table 1 suggests the point in contrasting the consequences of high versus low burnout, generally defined as phases I–III versus VI–VIII, respectively. Perhaps most notably, differences on virtually all variables are regular; thus, Phase I covariants are more desirable than those of Phase II, Phase II covariants are more desirable than those for Phase III, and so on for all paired comparisons. These mean differences for phases not only fall in the same directions, but they are also statistically-different in far more cases than one would expect.

Note that this general pattern of associations is all but universal, although variations in intensity exist that may reflect local conditions. The generalizations in Table 1 come from many studies in which those in Phase I were better off than those in II, those in II better than in III, and so on. To illustrate, the pattern is virtually the same in North American populations as well as those in 20-plus other nation states for which data are available.^[6] To a similar effect, the pattern is much the same for archival data as for self-reports. For example, those in Phase I spend the least on medical insurance; those in VIII spend the most; and the other phases have spending that progresses quite regularly through the phases.^[3]

Of great significance, both theoretic and practical, note that the high profile in Table 1 has a familiar character. Quite directly, that profile is like that associated with Participative Management or Industrial Humanism. This profile suggests that burnout is a

	Phases of Burnout							
	I	II	III	IV	V	VI	VII	VIII
Depersonalization	Lo	Hi	Lo	Hi	Lo	Hi	Lo	Hi
Personal accomplishment (reversed)	Lo	Lo	Hi	Hi	Lo	Lo	Hi	Hi
Emotional exhaustion	Lo	Lo	Lo	Lo	Hi	Hi	Hi	Hi

Fig. 1 Phase model assignments.

Table 1 Illustrated conditions characteristic of extremes of burnout

Least-advanced phases of burnout are characterized by:		Most-advanced phases of burnout are characterized by:
High	Participation in work decisions	Low
High	Involvement	Low
Low	Spending on medical insurance	High
Low	Physical and emotional symptoms	High
High	Performance evaluation	Low
High	Cohesiveness	Low
High	Autonomy at work	Low
High	Trust in management	Low
High	Trust in fellow employees	Low
High	Supervisory support	Low
Low	Family dislocation	High

centroid—the phases seem related to many aspects of nature relevant to management. This feature implies that the phases are a source of great leverage in planned change, once we understand them sufficiently to induce the effects we desire.

Virulence of Phases

The phase model is the only one that permits an estimate of how many people have which degrees of burnout. And, the overall message is alarming. On a large and growing panel of variables, self-reports and “objective” or “hard” variables, that is to say, persons in the progressive phases experienced diminishing and deteriorating conditions. Thus, those in Phase I reported the fewest or least severe symptoms of mental or physical illness, to illustrate; and those in VIII have the poorest record. In between, even more revealing, II are significantly worse off than Is; IIIs tend to report greater deficiencies than Is; and so on.

One example of the common pattern of relations will serve to illustrate the correlation of the phases with relevant variables. Consider physical symptoms, for

example (e.g., Ref. [3]). The 19 Michigan physical symptoms—from sweaty palms to chest pains^[7]—covary directly with the phases. For example, a national sample of respondents reflected this familiar pattern when compared to symptoms arrayed by the phases: those in Phase I had a small fraction of each symptom reported by the national panel; those in Phase VIII had five to 15 times to the incidence of symptoms reported by the national panel; and those in other phases fell in regular order.

The general sense of it is like a stepladder: as the phases vary, regularly and robustly, so do the conditions experienced by people tend to worsen or deteriorate. Table 1 provides useful illustration of these stable patterns of effects. As is almost universally true, all variables reflect such a good and bad pattern as burnout varies I→VIII.

Generalization About Incidence

The usual reservations about accumulating research apply, but the news is dominantly bad about the phase model, if not shocking. Several generalizations applied

**Scheme 1.**

to a panel of studies of incidence that numbered over 100 work sites from almost 20 nations, altogether including about 50,000 respondents.

First, overall, the United States and Canada report the least incidences of advanced phases along with New Zealand, but the base is high. In sum, over 24,000 cases reflect this distribution by phases among North American non-public work sites.^[6]

Second, the most favorable distribution of phases observed so far had over 22% in the three most advanced phases in any organization of any size ($N = 406$). Even this distribution will seem troubling to most observers.

Third, as a gross generalization, the global incidence seems worse. Roughly, about 10% more cases fell in the three most advanced phases; and 10% less are assigned to Phases I–III.^[6]

To be sure, the sampling of global work sites is not necessarily as representative as all non-North American work settings. So the generalization may have to be updated as the panel of national work sites is enlarged.

Fourth, there seem to be few outliers. Thus, phase data for New Zealand are substantially more attractive

than for other non-North American settings, which is consistent with all other observations using various operational measures. Even this outlier estimate promises no bed of roses, however. To illustrate several recent estimates of the distribution of phases in six New Zealand work sites generated the following pattern:

Details on several of the New Zealand sites are conveniently available.^[8]

In sum, such estimates suggest that burnout poses serious issues even in New Zealand, a “good” environment for burnout. Had the distribution shown related to a physical disease like measles, for example, it would be interpreted as a pandemic, or far beyond “epidemic” status. Even “pandemic” might be too mild to label what exists, even in North America or New Zealand.

Arenas and Burnout Differences

Despite common opinion, public agencies do not appear to be markedly worse off in the matter of burnout than businesses. Available data do not permit a

Scheme 2.

Scheme 3.

fine-tuned conclusion on the point, especially because most public agencies for which incidence data are available come from North American contexts, i.e., the United States and Canada.

Basically, the public sector seems to suffer about the same, or perhaps a tad more, than available business work settings. To suggest the point, 9656 employees in 24 North American public-sector settings demonstrated this distribution in the eight phases of burnout,^[6] contrasted with 63 North American non-public settings (N = 24080).

Overall, this summary suggests no better or worse situation in public versus business employment.

CONCLUSION

These perspectives on the phase model of burnout are usefully placed in several broader contexts: a half-dozen-plus generalizations seem appropriate at this general level of analysis. A much longer and detailed list has been developed (e.g., Ref.^[2]).

1. Globally, it seems safe to conclude that we have a burnout problem, of substantial dimensions in many cases, and even worse in some work settings.
2. One set of items, the Maslach Burnout Inventory, is the most dominant instrument for assessing burnout. The phase model uses the MBI, essentially. Overall, the MBI items seem to tap three subdomains: depersonalization, personal accomplishment, and emotional exhaustion.
3. One basic disagreement exists among MBI users. The phase model assumes for testing that the three MBI subdomains tend to build to the most extreme burnout. Depersonalization builds with negative consequences on personal accomplishment. High levels of these two can lead to emotional exhaustion.

The major opposed view is that of Maslach and her supporters (e.g., Leiter and Maslach, 1999). The interest begins with heightening levels of emotional exhaustion, which if accompanied by high depersonalization, will generate decrements in personal accomplishment.

It is too early to make a decision concerning these two views. They may reflect different target phenomena, e.g., the full burnout sequence for the phases, and a basic focus on advanced burnout eruptions by Maslach and her supporters. For extreme cases, this distinction does not matter much, but practical and especially theoretical advances will occur once the issue is resolved.

4. Applications to ameliorate burnout stand in need of further development, to be sure, but the phase model has supported several successful efforts to reduce burnout. Thus, Golembiewski and his associates^[3] report designs for three type of situations: when burnout is rooted in interaction, policies and procedures, or in structure.^[9]
5. Evidence suggests that burnout will become an even greater problem over time, although this certainty is not appropriate. We are definitely in an era of downsizing or rightsizing, to suggest the point, and burnout predictably increases in work sites affected by adverse personnel actions (e.g., Ref.^[3]). Evidence establishes that advanced burnout seems characteristic of people against whom adverse personnel actions have been taken.
6. Institutional and policy linkages seem to influence burnout, but as of today, there has been no concerted effort to confront them (e.g., Ref.^[3]). For example, burnout seems most advanced among working single parents, especially mothers (e.g., Ref.^[10]), and one can envision supports in public policy for such subgroups.
The apparently high costs, both personnel and organizational, associated with advanced burnout suggest the value of attention to such linkages. However, no vigorous study of the economic costs of burnout now exists, as far as this author knows. The dour inventory of burnout covariants suggests these economic costs will be substantial; and those covariants also imply high social and economic costs.
7. Advanced burnout has been tracked in expected ways in its impact on a substantial panel of variables, but much work remains to be done. Consider only two points. Thus, most measures of burnout effects have relied on self-reports, i.e., on what are often labeled "soft data." Work with objective or hard measures (absence rates, costs of production, turnover, and so on) is growing. But, more attention to such data is necessary.

In addition, increases in burnout are reasonably enough associated with the outbursts of violence at work that seem to be stage-center so often these days. Testing of such linkages has not yet been made directly. Advancing burnout has been all but conclusively associated with affective states that seem related to violence. These states include depression, hostility, and a broader range of non-psychotic conditions that would warrant therapeutic interactions (e.g., Ref.^[3]). However, the specific linkages to outbursts of violence have not yet been made.

INTRODUCTION

After over 40 years of frequent, and unusually drastic, changes in its political and economic regimes, Cambodia has made headway since 1991 in rebuilding its governance institutions. Considerable progress has been achieved in maintaining public order, increasing revenues, rationalizing public expenditure policy and management, introducing new audit mechanisms, launching democratically elected commune councils, and facilitating a vibrant civil society, private sector, and free media.

PUBLIC SECTOR

Since independence in 1953, Cambodia has experienced frequent, and unusually drastic, changes in its political and economic regimes.^[1,2] Over the period, it has moved from constitutional monarchy, to republic, to extreme Maoist agrocommunism, to Communist party rule, and back to a constitutional monarchy with an elected legislature. The most unstable period was the period of Khmer Rouge rule from 1975 to 1979. During this period, the market economy and business activities were completely abolished, and there was no money or trade. No private ownership of any kind was allowed. Cambodia was cut off from the rest of the world except China, the regime's main supporter. The entire urban population was forcibly relocated to rural areas to perform agricultural work. Many educated civil servants, professionals, and military officers were executed or died from starvation or disease. People wearing glasses or able to speak a foreign language, both seen as symbols of higher education, were killed. Estimates indicate that more than 1 million people, or about 15% of the population, died of unnatural deaths.^[3]

Since the 1991 Paris Peace Agreement, Cambodia has rebuilt its key governance institutions. National Assembly members were selected in an election supervised by the United Nations Transitional Authority in 1993. Cambodia's sixth constitution was adopted in 1993 and amended in March 1999 to establish the Senate as a political compromise between Cambodia's two main political parties. The National Assembly

holds primary legislative power and has become more active since the formation of a new coalition government in late 1998. Although there was renewed political violence in 1997, the trend has been toward peaceful resolution of political disputes and increased democratic participation. The National Assembly has enacted several new laws critical for improving governance, such as the Financial Institutions Law and the Audit Law. In addition, television broadcasts of debates have increased the transparency of the legislative process. Meanwhile, the Senate is investigating complaints about illegal confiscation of land and has recommended amending the constitution to ensure that it has adequate time to review proposed laws.

The power to initiate legislation rests jointly with the Prime Minister and members of the National Assembly and Senate. Most draft legislation originates with the Royal Government of Cambodia (RGC), led by the Council of Ministers. The assembly has simply tended to review and enact bills drafted by the RGC, often without being given sufficient time and lacking the requisite expertise. In addition, there is no central repository for all regulations or subdecrees, and the legislature rarely receives copies of regulations or decisions by ministries related to laws enacted. Finding them consists of visiting each ministry to see what they have, making it difficult for citizens to know how to comply.

The imbalance between the legislature and executive is paralleled by an imbalance of financial and technical resources available, with far more donor resources going to the latter.

Executive power rests with the RGC, which directs the civil administration and armed forces. In 2003, Cambodia has 166,672 civil servants (including defense forces, but excluding police, whose numbers are unknown). In comparison to other low-income countries, the Cambodian civil service is about average in terms of cost (the wage bill as a percentage of GDP, current expenditures, and revenues) and size (civil servants as a percentage of population).^[4]

Low salaries in the public sector are one of the most fundamental structural problems, with direct implications for the sector's accountability and transparency (or lack thereof). If this issue is not addressed, it is likely to remain as a major obstacle to other governance reforms.

The RGC approved a *Governance Action Plan* in 2001, and the Council for Administrative Reform had made good progress on completing the civil service census and on a Priority Mission Group scheme (identification of staff groups to receive enhanced salaries linked to performance benchmarks). Perhaps the area of reform that had the clearest government commitment and leadership is decentralization. Following the announcement of the intention to hold elections in the country's 1,621 rural communes and urban sangkats in February 2001, the Law on Commune Elections and the Law on Administration of Communes were promulgated, and the interministerial National Committee for Support to Communes/Sangkats and its subcommittees responsible for implementing the decentralization reforms were established. The commune and sangkat elections were held in February 2002, and elected councils are increasingly taking on local government functions guided by the RGC's Decentralization Roadmap.

In addition, downsizing the huge defense and security forces is an urgent issue that requires a new vision for the armed forces and police. However, their ideal size is difficult to assess without determining their new roles in postconflict Cambodia. Military and security agencies need to promote professionalism, train their staff to observe new codes of conduct, and develop relevant skills. A reassessment of the roles of the military and police is under way.

The Governance Action Plan also identifies issues concerning the management of natural resources (including land, forestry, and fisheries) as critical to ensuring social peace, environmental sustainability, poverty reduction, and economic development. There are three important areas: 1) the resolution of land issues (i.e., ownership, classification, registration, and tenure); 2) combating corruption and mismanagement of forests; and 3) ensuring long-term sustainability of fisheries. Communities need to be empowered to play appropriate roles in the management of natural resources and to help ensure accessibility by the poor.

The RGC has undertaken several key reforms of public finance and administration since 1993. For example, the 1993 Organic Budget Law (basic law that defines the overall legal framework), combined with prudent fiscal and monetary policy, has helped fight inflation and bring about macroeconomic stability. The 1997 Law on Taxation has improved the government's revenue-raising capacity.

In 2001, total public revenues were only 11.7% of gross domestic product (GDP), one of the lowest proportions among countries, although up from 8.3% in 1998. The introduction of a value added tax in 1999 contributed to the revenue increases, while simplifying the tax structure, widening coverage, and reducing cascading (taxation of something more than once).

Improvements in tax administration have included better collaboration among government departments and strengthening tax auditing. Collection of tax arrears is expected to be stepped-up through several enforcement measures, including freezing bank accounts. However, further reforms in tax administration need to be considered, such as setting up a semiautonomous revenue authority and reducing the use of ad hoc tax and duty exemptions.

Over the period 1998–2001, the RGC has generally maintained fiscal discipline, and there has been a shift in expenditures away from the military and security toward social and economic development, with education spending doubled and health spending tripled; yet social spending is still too low to meet development goals. Furthermore, budget execution has suffered from delays and unpredictable release of funds because of cash constraints, thus undermining operational planning. The system is plagued by gate keeping, deficient accounting and reporting systems, and the use of cash rather than the banking system, leading to a weak control environment. The Ministry of Economy and Finance is currently undertaking several measures to improve budget execution and revenue-enhancing capacity, planning to raise total revenue to 14–15% of GDP by 2007.

The Governance Action Plan includes provisions to improve gender equity and to reduce systemic barriers to accessing services for women and girls. However, until an output-based, medium-term expenditure framework system has been implemented, it will be difficult to ensure that policies designed to increase gender equity are properly prioritized and funded.

Legislation establishing the National Audit Authority consistent with international standards was passed in March 2000. The authority is independent of the executive, reports to the National Assembly, enjoys financial and administrative autonomy, and is authorized to determine the scope and methods of audits. An auditor general and two deputy auditor generals are appointed for 5-year terms by royal decree at the recommendation of the government and approved by a two-third-majority vote of the National Assembly. The current auditor general is from the ruling party, and the deputies are from minority parties. Although these are promising developments, more training and additional equipment will be needed, along with considerable political will, for the authority to be fully effective.

The judiciary has four distinct components: the Constitutional Council, formed in 1998; the Supreme Council of Magistracy, established in 1994; the courts; and the prosecutors. The Constitutional Council safeguards the constitution and decides cases involving the election of National Assembly and Senate members. The Supreme Council is the prime guardian of

the judiciary's independence and is the only body empowered to discipline and appoint judges and prosecutors. The Supreme Court and Appeals Court are located in Phnom Penh, and each province and municipality has lower courts. There is also a military court. As of 1999, Cambodia had 117 judges and 54 prosecutors.

An independent, capable, and uncorrupted judiciary is the foundation of the rule of law and underpins the development of a market economy. Unfortunately, Cambodia's judiciary does not yet meet acceptable standards in this regard. The decimation of the legal sector in the 1970s and the socialist legal principles and processes instituted in 1980s still have a strong influence on the legal system.

Only 33% of judges and prosecutors have any formal legal education and like other civil servants receive a salary that is less than a living wage. Budget allocations are inadequate to cover other basic costs. Thus the general perception that the court system is riddled with corruption is hardly surprising.

The procedures for forwarding draft laws to the Constitutional Council are applied inconsistently. Only organic laws are consistently sent to the council for review. Contrary to the constitution, other laws are sometimes forwarded directly to the king for promulgation without prior council review. Rules governing how judges, prosecutors, and the judiciary in general function leave many issues of jurisdiction among courts unsettled and provide no standard for resolving jurisdictional disputes, although a modern set of rules has been drafted and is under discussion.

In 2002, the government made commitments to the following: 1) a time-bound legal and judicial reform strategy would be completed; 2) the Supreme Council of Magistrates would be restructured; 3) a Law on the Statute of Magistrates would be submitted to the National Assembly; 4) reported cases of corruption would be immediately investigated and prosecuted appropriately within the existing legal framework; and 5) an anticorruption law would be submitted to the National Assembly. In addition, Cambodia in 2003 became the 19th country to endorse the Anticorruption Action Plan for Asia-Pacific, designed in collaboration with the Asian Development Bank and the Organization for Economic Cooperation and Development. The goal of this initiative is to help countries work together to build effective anticorruption mechanisms.

CIVIL SOCIETY AND PRIVATE SECTOR

Since 1993, the government has vigorously promoted the transition to a market economy. Laws regulating

the private sector include the 1994 Law on Investment, the 1995 Law on Organization and Functioning of a Council for Development in Cambodia and the Cambodia Investment Board, and the 1997 Law on Taxation. New institutions were created to enforce these laws. The economy has started to recover since the downturn of 1997–1998, with real growth rate of 6.3% in 2001 and 4.5% in 2002. While the RGC's efforts thus far deserve credit, challenges remain in reducing transaction costs, both formal and informal. Weaknesses in land law and enforcement need to be addressed. Businesses need clear rules that guarantee their property rights, resolve commercial disputes, regulate anticompetitive conduct, and limit state interference. Promoting fair and consistent enforcement of laws is also important. Setting up monitoring systems to enforce newly enacted laws and to strengthen the enforcement capacities of relevant agencies may be useful.

Although non-governmental organizations (NGOs) had an important role prior to 1991 in the absence of other donor agencies, their numbers and the value of their assistance have increased dramatically since then, with NGO disbursements equal to over 11% of external assistance during the period 1999–2001. The government's attitude toward international NGOs is liberal while somewhat more restrictive toward national ones.

Other civil society organizations have also emerged since 1991. Establishment of the Cambodian Bar Association in 1995 was a notable development. Among civil society organizations, the financial position of Cambodian NGOs is generally weak and highly dependent on foreign sources of funding. Some NGOs appear to be under the strong influence of political parties, while others reportedly abuse their NGO status. However, many are providing much needed development services.

The lack of a legal framework for NGOs may allow some NGOs to abuse their status or give government officials the discretion to issue arbitrary decisions on the status of NGOs. To address these concerns, a draft legal framework is being finalized for discussion.

In the 1980s, media organizations were used for political party propaganda, and no privately owned media existed. Currently, Cambodia has more than 200 newspapers and magazines, including several foreign language newspapers, and a number of television and radio stations. The constitution guarantees the freedom of expression, press, and publication. The Press Law creates a legal framework.

While the Press Law guarantees more freedom than equivalent laws in other countries in Southeast Asia, journalists worry that vague definitions of terms present a risk that they could be used as excuses to suppress the freedom of the press. The media needs

mechanisms to curb irresponsible reporting, sometimes influenced by political parties.

CONCLUSION

Cambodia's experience in rebuilding its governance institutions since 1991 highlights that reform is a long-term process that requires setting achievable goals and providing consistent support. Considerable progress has been achieved in maintaining public order, increasing revenues, rationalizing public expenditure policy and management, introducing new audit mechanisms, launching democratically elected commune councils, and facilitating a vibrant civil society, private sector, and free media. While many challenges lie ahead, the commitment to the reform process demonstrated by the government and the achievements made to date are heartening.

Capital Budgeting

Jane Beckett-Camarata

Department of Political Science, Kent State University, Kent, Ohio, U.S.A.

INTRODUCTION

Capital budgeting is the process of determining need and acquiring, constructing, improving, or purchasing capital assets. For our purposes, a capital asset is any large resource (e.g., land or buildings) that has benefits that extend more than 1 fiscal year. Capital assets are budgeted for in a capital budget. The capital budget is an integrated physical and financial plan for improvements. The capital budget is also the authorization for funding and acquisition of capital assets and must be approved by the legislative body.^[1] The capital budget plays a critical role in most public organizations since the life of capital assets usually extends beyond 1 year. When used in conjunction with the strategic plan, master plan, capital improvements plan (CIP), and debt management plan, the capital budget provides a way of systematically and efficiently acquiring and funding capital expenditures. Capital budgets are used extensively by state and local governments. The federal government currently uses elements of the capital budgeting process and it too is moving toward using a capital budget.

THE CAPITAL BUDGET PLANNING AND DECISION PROCESS

State and local governments are recognizing the importance of planning for capital improvements and tying capital improvements to the overall goals of the community through strategic planning and capital budgeting. The connection between strategic planning, capital improvements planning, and capital budgeting is important because such a connection has a potential positive influence on economic development and offers a way of increasing fiscal capacity. Inadequate planning can result in unnecessary expenditures of public funds.

The key parts of capital budget planning and decision-making process are

- Strategic plan
- Master plan
- CIP
- Debt management plan

The capital budget planning and decision process model is outlined in [Fig. 1](#).

Strategic Plan

For those state and local governments who have and use a strategic plan, the goals, objectives, and strategies outlined in the plan indicate how jurisdictions intend to fulfill their mission and address critical issues including capital needs. The strategic plan should be the basis for identifying capital requirements. The master plan should flow naturally from the strategic plan.

Master Plan

Most state and local governments are required to have a master plan. A master plan delineates current and future land use, and guides land and physical plant use. Master plans may contain, for example, site and utility drawings.

CIP

The CIP is a catalog of capital projects selected for funding for the next 5 to 10 years. Capital projects have an impact on future operating budgets. Each CIP should contain estimates for operating and maintaining the capital improvement after it is completed. The cost estimates include any expenses in connection with maintaining the improvement as well as costs of additional activities or new programs that will be using the new or expanded land/space.

The CIP identifies the needs of the state or local government and ranks the projects in priority order. The primary difference between the capital budget and the CIP is that the capital budget is a legal document that appropriates funding for specific projects. The CIP is important for capital planning for any local government, even if there are not a lot of large-scale projects.^[2] In addition to shaping thinking about future capital assets needs, the CIP compels decision makers to review, compare, and assign priorities to projects. If the capital and operating budgets are combined, the first year of the CIP is then included as the capital portion of the annual budget.

The CIP is a “rolling list” of capital projects. The first year of the CIP becomes the capital budget. Each year the CIP is updated (second year of the plan and a new year is added), and revenue and expenditure

Fig. 1 The capital budget planning and decision process model.

estimates are revised for the remaining period. An effective CIP consists of both an administrative process to identify the location, scale, and timing of needed capital projects and a fiscal plan to provide for funding those projects. Producing a CIP is more efficient than conducting a new search each year for capital projects or capital equipment purchases.

If a state or local government has an existing capital budget, why does it also need a CIP? The capital budget represents the first year of the CIP. The capital budget is a legal document that authorizes specific projects during the following fiscal period. The capital budget lists only the projects and equipment to be carried out or purchased during the fiscal year. A CIP lists projects and equipment purchases that are expected and scheduled over a period of 5 years or more. CIP requires state/local governments to look ahead, see what their capital needs are, and plan for future projects. What are the population trends? Will more schools, prisons, or roads be necessary? How will such projects be funded? Will funding the projects require a bond referendum? Large and expensive projects such as roof replacement may need to be completed in segments, to hold down annual costs. The out years of the CIP are not binding and are therefore subject to change.

The typical CIP is a multi year projection that forecasts spending for all anticipated CIPs. Buying land for parks, airports, retention ponds, and public buildings is much less expensive when the population is small, and the land can be held in a relatively undeveloped state until needed. Long-term planning for water and sewer lines can also be helpful. For example, if projecting ahead discloses that future population estimates exceed current water production capacity, planning may be needed to expand and protect the watershed, build aqueducts, drill wells, or lay pipe to reach surface water. Such projects may require more than a 5-year planning range.

Many capital proposals come from the departments, for example, public works (street improvements),

utilities (water, wastewater, sanitation), and planning (as part of the master plan). Citizen complaints are a second source of requests for capital spending, although these may be funneled through departments or council members. Community-based interest groups can also be an important source of proposals for projects. Proposals also come from members of the business community and elected officials. Normally, the cost of these proposals far exceeds available financing.

Decision making on capital assets that go into the CIP is not simple and can be aided greatly if there are clear, detailed answers to the following questions:

1. How many citizens will be harmed or inconvenienced if the project is not constructed? Which citizens?
2. Adequacy of existing facilities to meet current and projected program demand.
3. Will the project add to the property value of the area, thus increasing the value of state/city property and receipts from property taxes? How much of an increase will be realized?
4. What services will be initiated, expanded, or improved because of this project?
5. What is the impact on those services?
6. Will the project increase the efficiency of performance? How much and where? What cost savings will result? Will the project reduce the cost of performance for a particular service? How much and where?
7. Will the project provide a service required for economic growth and development of the municipality/state?
8. Is the estimated cost of the improvement within the city's/state's ability to pay?
9. How the project fits the approved strategic plan and master plan?

Ultimately, priorities have to be decided and decisions have to be made. Sometimes analytical techniques such as cost-benefit analysis are useful, but judgment is also used. Some communities use a point system to establish priorities. One scale used is:

1. Urgent (highest priority)
2. Essential
3. Necessary
4. Desirable
5. Acceptable
6. Deferrable (lowest priority)^[3]

WHO USES CAPITAL BUDGETS?

Many state and local governments separate capital expenditures from operating expenditures. Eighty-four

percent of state governments separate capital expenditures from operating expenditures,^[4] 40% of counties^[5] separate capital expenditures from operating expenditures, and 71% of cities^[6] separate capital expenditures from operating expenditures. The federal government does not have a “full-scale” capital budgeting process. Funding for most federal capital assets is provided in annual appropriations under discretionary caps.

State and local governments use capital budgets because it improves decision efficiency since capital assets can be financed either by revenue raised currently (taxes, charges, grants, etc.) or by borrowing on the promise to repay from future revenues. If operating and capital expenditures are combined, capital assets appear more expensive relative to operating expenditures, even though they will be used over a number of years. Capital budgets are financed, but not necessarily balanced; operating budgets are balanced.^[7]

WHO IS INVOLVED IN THE CAPITAL BUDGET PROCESS?

Because capital expenditures represent a considerable financial outlay, who participates in the process is important to the success of the capital budgeting process. The main participants in the capital budgeting process are the government unit's (state or municipality) departments, a Capital Improvement Committee, a budget and/or finance department, legislative bodies, individual politicians, citizens, interest groups, and planning commissions.

The most traditional approach to formally soliciting citizen input into the capital budgeting process has been to form a capital budget planning committee. In the past, the committees have been made up of large, politically important interest groups in the municipality. Elected officials are becoming more sensitive to the need to increase the diversity of these committees for both equity and economic reasons.^[8] Some governments have also moved outside merely soliciting input from one citizen committee to broader representation, such as formally soliciting suggestions for capital improvement priorities from several citizen advisory boards representing different planning areas.^[9] Providing citizen input into the capital budgeting process may potentially provide the foundation for public support if a bond referendum is necessary.

The traditional informal approach is that which takes place through informal political bargaining in the capital budgeting process. Politics are an integral part of the capital budget process because elected officials must be perceived as being responsive to the electorate.

There are high power stakes in project selection. For example, the location of a new highway and its major intersections can produce windfalls for property

owners whose land borders the project. Professional staff can examine campaign promises for political priorities relevant to the capital budget.^[1] For example, the mayoral campaign may have promised downtown renewal, council members may have promised downtown renewal, and council members may have promised to revitalize the neighborhoods or to improve the physical plant of a school. Appointed officials usually have some priorities, such as adequate funding of maintenance projects and compliance with state and federal mandates.

INVENTORY OF ASSETS

Decisions to add a public facility or make extensive repairs can be made on the basis of understanding the needs of the community or the state and the resources available. The best approach to identifying the resources is to inventory the existing public facilities. The next step is to catalog the proposed public facilities. The key data in the capital register include:

1. Location of the proposed facility
2. Year of construction
3. Cost priority
4. Project description
5. Financing schedule
6. Prior or sunk costs
7. Projection of future-related funding requests
8. Operating costs
9. Savings in operating and maintenance costs

DEFERRED MAINTENANCE

In addition to cataloging the existing capital assets, they also must be evaluated to project repair, renewal, or replacement needs that will preserve their ability to support the mission or activities that they were assigned to serve.^[10] Condition assessment is critical to a capital budgeting program. To perform such an assessment requires both a useful database of existing conditions and the implications of such conditions for future performance.^[11] Condition assessment, cost estimating, and other asset management approaches are important individual strategies within a capital maintenance program. This is especially true where the highest priority is not acquisition of new assets but maintenance of old ones. Maintenance of capital assets is becoming an increasingly important subject because many public organizations must manage what they have and keep assets in service long after their “useful life” has expired. The challenge is to avoid deferral of necessary expenditures for maintenance, referred to as “deferred maintenance.” Deferred

maintenance can lead to asset failure that in turn can lead to replacement and extensive rehabilitation needs that are much more expensive than would have been the case if the assets had been kept in regular working condition. Many public organizations have poorly developed methods of measuring and costing deferred maintenance and its potential affects, and condition assessment is inconsistent. Because condition assessment is a prerequisite for deferred maintenance reporting, failure in condition assessment can lead to deferred maintenance.^[12]

COST ANALYSIS

Most state and local governments have limited resources, as well as legal political restrictions on their ability to raise revenue. For these reasons, a limited number of capital items can be acquired during any one period of time. Priorities have to be made to fund those that are considered to be the most important. Some combination of economic analysis, such as cost-benefit analysis, citizen input, and the political agenda, are factors that determine importance. A combination of quantitative, qualitative, and political is preferable. The key is to match available revenue sources with a wide-ranging set of expenditure options and to match expenditure options to revenue availability.

Cost-benefit analysis can be used to compare capital improvements. Not all proposed capital expenditures are associated with their cost relative to their benefits. Many decisions are made on other bases. State and local governments would not spend the level of resources they currently do on such things as hazardous waste disposal sites if it were not required by the federal government. Also, some decisions are made on the basis of equity rather than cost. For example, providing mass transit in low-use areas may not make economic sense. If these areas are also populated by low-income citizens, however, eliminating such facilities simply because they are not economical is often rejected by government agencies responsible for such facilities on the basis of equity.

FUNDING SOURCE IDENTIFICATION

Only a limited pool of resources is available to fund all the requested projects. The challenge is to identify the full range of resources available, both current and borrowed, and to determine how these funds can be used to meet the needs with the highest priorities. The resources usually considered are:

- Pay-as-you go financing—costs are paid directly from current income, such as taxes, fees and user charges, and interest earnings

- Grants from other governments
- Debt financing—tapping external funds through the issuance of debt in the capital market
- Public/private ventures, including privatization

Most governments find that current revenues are inadequate to fund all the projects in their capital plan. For this reason, a well-structured CIP should include a review of all financial resources that are available to meet current and future capital needs. The mix of financing methods that will be used to fund a CIP is likely to be one of the most important decisions made in developing and executing a CIP. In the case of debt financing, amortization rates and repayment schedules are determined by the parameters established by the mix of financing tools used. Each method of financing has advantages and disadvantages, and each is viewed in the context of its applicability and its effect on the government's overall spending levels and fiscal health.

DEBT MANAGEMENT PLAN

Rating agencies look favorably on state and local governments that assess affordability in managing debt. Debt capacity recognizes that state and local governments have limits to capacity to issue debt at a given credit level. As a general policy, a local government should decide whether to pursue a pay-as-you-go or a pay-as-you-use strategy. The pay-as-you-go approach relies on current revenues to pay for capital improvements; the pay-as-you-use approach relies on general obligation debt to pay for capital outlays. Using pay-as-you go financing, current taxpayers bear the burden of financing improvements and future residents reap the benefits. As long as the repayment of the debt does not exceed the life of the asset, a pay-as-you-use strategy may be more equitable than pay-as-you-go. However, debt funding of capital projects does have some obstacles. State law may require a voter referendum to obtain citizen approval for issuing bonds, and that approval may be difficult to obtain. Some local governments may face legal limits on the amount of debt that can be backed by the full faith and credit of the local government.

With the pay-as-you-go approach, intergenerational equity is violated. This means that those who benefit from the use of the capital asset are not necessarily the ones who finance the asset. For example, if taxpayers in a community use money from current revenues to build a swimming pool, the beneficiaries of the swimming pool may not be the same as those who put their tax dollars toward building it because some, for example, may move away. This is inequitable because they helped build a facility they have never had a chance to use.

The pay-as-you-use approach provides for intergenerational equity because it helps spread the costs of the capital asset over a number of years, which makes acquisition or replacement more feasible in the majority of cases. It avoids great fluctuations in expenditures and revenues. It also provides for intergenerational equity by allowing those paying taxes or user fees for a particular capital expenditure to have access to that asset.

The issue with the pay-as-you-use approach is that financing a capital asset might exceed the useful life of that asset. In other words, an asset should not be financed for 10 years if the asset will need to be replaced in 5 years. That type of borrowing can place the organization in a financially difficult position of using current revenues to pay for capital assets that no longer exist.

The debt management plan should deal with issues such as:

- What type of bond repayment guarantee to offer investors
- How much borrowing to allow
- What to do if actual expenditures are higher or lower than the funding set aside for the projects

To a certain extent, selecting funding sources for capital projects is a matter of piecing together the funds that are available in any one year. For example, a project may be funded from a mix of current revenues, state or federal grants, bond proceeds, intergovernmental contributions (e.g., from a county or from other communities benefiting from the improvement), reimbursements, and builder contributions. Improvements to utility services may be financed through grants, the sale of revenue bonds, and service charges levied on users.

Whatever the mix of funding sources for capital projects, there are underlying policy issues that must be dealt with—preferably through an explicit debt policy statement. A policy statement protects the operating budget from excessive debt service and sets a limit on the amount (and type) of borrowing.

THE CAPITAL BUDGET

The capital budgeting cycle consists of capital budget planning, development, council/legislative budget review, and capital budget execution. The operating and capital budgets may be prepared separately during the fiscal year, or they may be prepared concurrently. During the capital improvements planning stage, CIPs are proposed. Next the capital improvement requests are prioritized based on the strategic plan goals (if a strategic plan is used) and availability of funds. During

the capital budget development stage, departments submit their capital requests. The budget office refines each project budget and scope to determine if they are appropriate. This phase concludes with the highest-priority projects being included in the capital budget.

The beginning stages in the capital budget process become the link between the strategic plan and the CIP. With capital budgets, an ongoing problem exists, as with all public decisions concerning resource allocations, that is, how to fund capital priorities. When planning capital improvements, the question is “on what basis shall capital asset decisions be made to promote long-term (capital) activity A instead of short-term (operating) activity B?” The most difficult decision faced by policy makers is choosing which capital assets to acquire or replace. State and local governments usually have finite resources, and have legal and political restrictions on their ability to raise revenue. For these reasons, a limited number of capital items can be acquired during any time period. Priorities must be set to fund projects that are seen as most important. No matter how the various projects are ranked, rated, or prioritized, the funding of capital items is dependent on adequate revenue. An important difference between the capital budget and the operating budget is the method of financing. The process of developing a separate capital budget helps public decision makers to choose between funding specific individual capital assets or projects while staying within a total resource threshold.

What are some of the justification for including items in the capital budget?

- Essential public purpose
- Long useful life
- Infrequent and expensive

Unique Characteristics of Capital Budgets

Local and state governments have two types of budgets: capital and operating. The difference between the budgets is that the operating budget funds recurring activities, whereas the capital budget funds large non-recurring expenditures for capital assets. Capital budgets are different from operating budgets in two ways. First, capital and operating financing sources are different. Capital budget items are normally paid out of one-time, earmarked sources such as debt proceeds and grants. Segregating capital expenditures helps to ensure that revenues budgeted for capital items are indeed spent for those purposes.

Second, capital and operating budgets decision-making processes are different. Preparing a capital budget involves using information obtained from the CIP. One way to help the capital budget decision-making

process is to include a definition of a capital improvement/asset in the capital budget policy statement. Everything in the operating budget occurs within a fiscal year; capital projects, however usually take years to plan and implement. For example, road repairs may be defined as operating or as capital, or road repair projects intended to last less than a few years may be defined as capital. Whatever the definition, it should be used consistently, and the legal and policy implications of any deviation from this definition should be explored before a change is implemented. Unlike an operating appropriation, which is usually limited to 2 years' duration, a capital expenditure appropriation routinely may be retained, carried over from year to year, and spent until the project is completed.

Capital projects ordinarily require extensive planning reviews and site preparation. Any major change in a capital project can only be done at considerable expense. However, an amendment or revision in an operating budget can normally be during the current year. Capital projects usually have to be in sequence. For example, a street-resurfacing project may be preceded by replacement of water and sewer lines. Capital spending tends to be uneven because capital projects are often grouped in clusters. Operating expenditures tend to be relatively even throughout the year. Finally, capital projects normally require change orders and require closer monitoring of project performance, whereas actual operating expenditures are assessed against expected expenditure outlays (Table 1).

There is usually some discretion in determining what expenses relate to the operating budget and capital budget.^[2] For example, if a police squad car is leased, is it part of the operating budget? One method

for handling ambiguities relating to categorizing capital assets is to divide them into two types: ongoing departmental capital and large capital projects. Ongoing departmental capital includes furniture, office equipment such as computers and photocopiers, and minor remodeling. For departmental capital, the criterion of lasting a year or more and costing more than some minimum number of dollars is appropriate. In the case of motor vehicles, it is simpler to categorize all expenditures for passenger vehicles as either capital or operating, rather than to distinguish between automobiles that will last more than 1 year and those that will last less. For large capital projects, whatever labor and supplies are used can be considered part of the capital costs. The result may not be perfect, but it is clear and useful. The important point is to develop policies appropriate to the circumstances and then apply these policies consistently to avoid the potential of a lower bond rating or even to a qualified audit opinion.

The capital budget appropriates funds for the projects in the first year of the CIP and recommends the authorization of necessary bond issues. This legislative authority does not extend to the remaining years of the CIP, thereby necessitating an annual update of the plan.

After the proposed capital budget expenditures are approved, appropriated funds are allotted for expenditures as the capital project progresses through the various stages. Usually, funds are allotted so that preliminary site drawing work can begin. Awards are made from submitted bids, and the facility is constructed and/or lands purchased. To access the remaining appropriated funds, formal written justification needs to be submitted. In addition, capital

Table 1 Capital budget decision categories

Acquisition consists of obtaining any interest in real property, including improvements of any kind on the acquired land, except certain utility easements. All acquisitions are subject to the capital improvements process.

New construction is a single undertaking involving construction of one or more facilities. It includes 1) construction of or site work for a new facility; 2) any addition, expansion, or extension to a structure that adds to its overall exterior dimensions; and 3) complete replacement of a facility. If a new construction project meets one or more of the following criteria, it is subject to the capital budget process:

- It creates additional building space of 5000 square feet or greater.
- It has a total project cost of \$250,000 or greater.
- It is acquired through a lease with options to purchase or any other alternative financing approach.

Improvements are a complete and usable change to an existing facility or structure. Improvements are a complete and usable change to an existing facility or structure. Improvements include 1) alteration or conversion of interior space and other physical characteristics; 2) renovation to a facility or its infrastructure; 3) restoration of a facility or structure; and 4) major repairs to restore a facility or system. If an improvement costs \$500,000 or more, it is subject to the capital process.

Equipment is a tangible resource of a permanent or long-term nature used in an operation or activity. No precise criteria exist to help to determine whether equipment is an operating or capital expense.

appropriation balances are normally reappropriated at the end of each fiscal year until the project is completed.

CONCLUSION

The capital budget plays a critical role in most public organizations because the life of capital assets usually extends beyond 1 year. In capital budgeting, planning and careful action is essential. When used in conjunction with the strategic plan, master plan, CIP, and debt management plan, the capital budget provides a way of systematically and efficiently acquiring and funding capital expenditures. State and local governments are beginning to integrate strategic planning, master planning, capital improvement planning, and debt management. Capital budgets are used extensively by state and local governments because they improve decision making as capital assets can be financed either by revenue raised currently (taxes, charges, grants, etc.) or by borrowing on the promise to repay from future revenues. Decisions to add a capital asset such as a public facility or to make extensive repairs to an existing facility should be made on the basis of understanding the needs of the community and the resources available. The capital improvement planning process is becoming less political. Some local governments have moved away from simply soliciting input from one citizen committee to broader citizen representation by formally soliciting suggestions for capital improvement priorities from several citizen advisory boards representing different planning areas.

INTRODUCTION

When people need to purchase a car, a house, or other things of value, they usually turn to a bank to borrow the money necessary to complete the purchase. The money is capital—financial resources available to purchase something of value. One can say that the market for residential mortgage capital, for example, consists of (mostly) individual borrowers and bank or finance company lenders. The borrowers need the capital to finance the purchase of homes.

The term capital markets refers to the informal meeting of buyers and sellers of capital. We use the term informal, because most often, there is no particular meeting place for buyers and sellers (in contrast, the New York Stock Exchange is a formal market for the buying and selling of stocks listed on the Exchange). More likely, the parties meet through an intermediary such as a broker or dealer of municipal securities. Through the exchange of securities, such as bonds for cash, municipalities are able to raise funds to invest in infrastructure, to carry out economic development activities, or to carry out any number of functions related to the exercise of government authority.

Municipal capital markets are large in a financial sense. At mid-year 2001, the municipal market comprised \$1.6 trillion of debt outstanding.^[1] More than \$240 billion in long-term municipal securities were sold in 2000.^[2] They are also large in an economic sense. Many of the important facets of American life—schooling, transportation, recreation—would not be the same without the influence of the capital markets, both as a provider of capital and as a source of financial discipline for issuers.

In this article, we will sketch the dimensions of the municipal capital markets. We will first define the demand side of the market, detailing who is buying capital, why they buy it, and what they exchange for the purchase of capital. Then we turn our attention to the supply side and describe who provides capital in the municipal market.

THE DEMAND SIDE OF THE MUNICIPAL CAPITAL MARKETS

The primary purchasers of municipal capital are state and local governments and their affiliated agencies and authorities. These organizations buy capital by selling municipal securities, most often in the form of bonds. A bond is considered a debt instrument—a loan for a defined period of time at a specified interest rate. In exchange for capital, the government organization issues a certificate, or bond, that states the interest rate to be paid and when the loaned funds are to be returned (maturity date).

State Governments

State governments borrow to build infrastructure where the benefits of that infrastructure accrue to residents of the state as a whole. As of 1997, state governments had almost half a trillion dollars (\$454.5 billion) of debt outstanding.^[3] On a per capita basis, that is an average of \$1697 in state debt outstanding. However, there is tremendous variation in the per capita amount of state debt outstanding. Dividing the nation into nine somewhat arbitrary regions (and excluding Alaska, Hawaii, and the District of Columbia), Northeastern states have an average of \$4386 in debt outstanding, and Middle Atlantic states have an average of \$2779. Without those regions included, per capita debt outstanding drops to an average of \$1290. The majority of states fall near this lower average. Southwestern and Southeastern states have average per capita debt burdens that are much lower than in other regions.

Nearly three-quarters of state debt outstanding (73.7%) in 1997 was “non-guaranteed” debt, while the other one-quarter was “full faith and credit.” Full faith and credit debt is issued with the full backing of the issuing jurisdiction. That jurisdiction pledges that it will use all resources at its disposal to pay back bondholders. This implies that the government will raise taxes if necessary to repay the holders of debt.

Non-guaranteed debt lacks such a pledge. An example would be a city that issues debt to finance a new stadium. If the city issues full faith and credit debt (most often called general obligation or GO debt), regardless of the financial outcomes of the stadium, citizens of the city are responsible to repay the debt, usually through payment of property taxes to the city. By contrast, if the city issues non-guaranteed debt and the stadium is not profitable, citizens are not held responsible for repaying bondholders.

There is some variation among states in the use of non-guaranteed versus full faith and credit debt. Nine states (Idaho, Indiana, Iowa, Kansas, Kentucky, Nebraska, North Dakota, South Dakota, and Wyoming) have no state issued full faith and credit debt outstanding, and one (Colorado) has full faith and credit debt representing less than 1% of their total outstanding debt. At the other end of the spectrum, four states (Connecticut, Georgia, Nevada, and Washington) have more than 60% of their outstanding debt in the form of full faith and credit debt. With some exceptions, the heaviest users of non-guaranteed debt are Midwest and Great Plains states, while the heaviest users of full faith and credit debt are in New England, the Southeast, and the Pacific Northwest.

The largest category of debt outstanding for states is industrial development revenue bonds (IDRBs). These non-guaranteed bonds account for 42.6% of all state debt outstanding (they also account for 49% of debt issued by states in 1997). State and local governments issue IDRBs to finance improvements of private businesses. The business then makes some form of regular payment to the governments who pass them through to bondholders. The difference between what state and local governments pay in interest on debt outstanding and what the private business would pay is a subsidy to the business; the subsidy is offered in order to encourage capital investment in an area. Again, there is substantial variation in the use of IDRBs. IDRBs represent more than three-quarters of the debt outstanding of seven states (Alaska, Idaho, Montana, Nebraska, North Dakota, South Dakota, and Wyoming). Kansas has no IDRBs outstanding, and in Arizona and Texas, IDRBs account for less than 10% of debt outstanding. With the exception of Kansas, the heaviest users of IDRBs are Great Plains, Great Lakes, and Rocky Mountain states. Southeast and Southwest states use relatively less IDRBs.

The second largest category of debt outstanding for states is debt incurred for higher education purposes. It accounts for 11.3% of state debt outstanding. Florida has the largest per capita debt outstanding for higher education—\$541 or 49.5% of total debt outstanding. Other states with large per capita debt outstanding for higher education are Alabama,

Indiana, and New York. Georgia and Wisconsin, by contrast, have no outstanding debt for higher education purposes.

The Relationship Between State and Local Borrowing

When discussing local government debt issuance, it is most useful to divide the local sector into different types of issuers, such as school districts or special districts. This is because each type of issuer has distinct reasons for borrowing. However, before we move to different types of issuers, we make a general observation about local government borrowing as a whole. The amount of borrowing that local governments make seems to be inversely related to the amount that the state borrows (formally, a regression of local government debt outstanding on state government debt outstanding produces a negative and significant coefficient).

There are at least two explanations for this phenomenon, one structural and the other market based. The structural explanation holds that in some states, borrowing for certain activities is effectively reserved for one level of government. One example of this is IDRBs. New Hampshire has the second highest per capita amount of state IDRB debt outstanding, while at the same time having no local IDRB debt outstanding. Massachusetts has the fifth highest level of state IDRB debt outstanding and the 48th lowest level of local IDRB debt. In these states, borrowing to subsidize private business development has (explicitly or perhaps only implicitly) been designated a state function. On the other end of the continuum of state/local responsibility, the examples are Kansas with zero state IDRB debt has the sixth highest local IDRB debt outstanding, and Florida, with the 47th highest level of state IDRB debt and the ninth highest level of local IDRB use. In these states, local governments bear the burden of financing economic development through borrowing. So, there seems to be some evidence supporting a structural explanation of the relationship between state and local borrowing (furthermore, a regression of local IDRB debt outstanding on state IDRB debt outstanding also yields a negative and significant coefficient).

The market-based explanation is based on the notion of market segmentation. Instead of one large market for municipal capital, there are actually multiple segmented markets, at least one for each state and potentially more for different types of securities. The interest rate that an issuer must offer in order to sell bonds is based not only on prevailing interest rates and on the default risk of an issue, but also on

the amount of demand for municipal capital.^a In states where the state government issues debt quite often, the increased demand may bid up interest rates. This forces the local issuer to sell bonds at higher interest costs or to forego borrowing. While it would be nearly impossible to test this explanation directly, the market segmentation hypothesis has held up quite well in empirical tests.

Local Governments

Local governments are large issuers of municipal bonds. As of 1997, local governments had \$750 billion in debt outstanding. As mentioned above, there are several types of local government issuers, each with a unique set of needs for municipal capital. We will consider four types of issuers: counties, cities (along with townships with borrowing authority similar to cities), special districts, and school districts.

There is large variation in the amount and type of debt issued by U.S. counties. In total, counties had \$163 billion in debt outstanding, or about 21% of the local total. The average per capita county debt outstanding for states was just over \$610. But the standard deviation of per capita county debt is almost as large as the mean. The range of county debt is from essentially no debt outstanding (in Vermont, the figure is less than one cent per capita) to over \$2000 per person in two states (in Maryland and Nevada). In eight states (Maryland and Nevada, as well as Florida, Kansas, Kentucky, Mississippi, North Carolina, and Tennessee), county debt outstanding is equal to or greater than state debt. However, in most of the remaining 42 states, state debt far outpaces county debt. County debt issuance tends to be highest in the Middle Atlantic, Southeast, Southwest, and Western states. The Midwest ranks far below the other regions, and there is little county debt outstanding in New England states.

IDRBs are by far the largest reason for counties borrowing. Counties had \$62.4 billion in IDRBs outstanding in 1997, or about 38% of their total debt outstanding. In six states (Arkansas, Kentucky, North Dakota, Oklahoma, West Virginia, and Wyoming), IDRBs comprise over 85% of total county debt outstanding. In per capita terms, the largest state concentrations of county IDRB use are in the Middle Atlantic, Mideast (Ohio, Kentucky, West Virginia), Southeast, Midwest, and Upper Great Plains (North Dakota, Wyoming) states. States in the Pacific Northwest and Great Lakes regions have relatively little

county IDRB debt outstanding. Four states in New England (Maine, Vermont, New Hampshire, and Massachusetts) have no county IDRB debt outstanding. The next largest amount of county debt outstanding (about \$8.3 billion) is for elementary and secondary (K–12) education. Most of the debt outstanding in this category is concentrated in four states (Maryland, North Carolina, Tennessee, and Virginia).

Cities are by far the largest issuers of local debt. As of 1997, cities and townships had \$302.2 billion in debt outstanding. On a per capita basis, that amounts to about \$1100 per person. Again, there is some variation in city borrowing but not as much as with counties. Alaska, New York, Minnesota, and Colorado cities all have more than \$2000 in per capita city debt outstanding, while Idaho, Maryland, Mississippi, South Carolina, and West Virginia each have less than \$400 per capita. The heaviest city borrowers are located in the upper Midwest, lower Great Plains, and Southwest regions.

The largest reason for city borrowing is to provide utility services to residents. Cities had \$64.7 billion in outstanding utility debt, or about 21% of total city debt outstanding. Cities in the Southwest and West Coast regions tend to have more debt outstanding than in other regions. Most of the utility debt outstanding is for water and electric utilities. Within the general category of utilities, water utilities are 69% of the debt outstanding, electric utilities comprise 29% of the debt outstanding, and gas utilities the remaining 2%. The Southwest, Rocky Mountain, and Southeast regions have the most debt outstanding for water utilities, while the West Coast, Southwest, lower Midwest (Iowa, Nebraska, Missouri, and Arkansas), and Mideast (Kentucky and Tennessee) regions have the most electric utility borrowing. Most utility debt (81%) is non-guaranteed. City water utilities are most often run on a fee-for-service basis. The fees provide a dedicated revenue stream that can be leveraged with bond issuance to provide increased water system capacity.

The other major area of borrowing by cities is once again for industrial development. But, there is marked variation of city borrowing in this area. In 18 states, less than 10% of debt outstanding is IDRBs. However, in 10 states, more than one-third of borrowing is for industrial development. Also, there appears to be no geographic pattern to city use of IDRBs. The states with the heaviest use are spread throughout each geographic region.

There is surprising variation in the amount that school districts borrow to fund capital investment in K–12 education. School districts across the United States had \$105 billion in outstanding debt in 1997, or about \$393 per capita. School districts in 11 states had more than \$500 per capita in outstanding debt, led by Nevada, Minnesota, and Pennsylvania with

^aFor more on segmented markets, see Hendershott, Patric H.; Kidwell, David S. The impact of relative security supplies: a test with data from a regional tax-exempt bond market. *Journal of Money, Credit and Banking* 1978, 10 (3), 337–347.

more than \$900 per capita. Conversely, 10 states had outstanding school district debt of less than \$200 per capita, with five states (Connecticut, Indiana, Massachusetts, Rhode Island, Tennessee, and Virginia) having less than \$100 per capita outstanding. However, these figures are somewhat misleading. In these states, other government types borrow to fund capital investment in K–12 education. In Indiana, school districts are considered separate special districts. In Connecticut, Massachusetts, and Rhode Island, cities and townships borrow for this purpose. Finally, in Tennessee and Virginia, counties carry the bulk of K–12 debt. Once the borrowing by all types of government for K–12 education is taken into account, only one state, North Dakota, has less than \$200 per capita in outstanding K–12 debt.

The final category of borrower that we consider here is the special district. Special districts have more debt outstanding in aggregate than do school districts—\$179 billion in 1997. The purposes for which special districts issue debt are diverse. The largest category of debt outstanding is for electric utilities. Just over \$51 billion of special district debt for this purpose was outstanding in 1997. Once again, variation is high in electric utility debt. Seventeen states have no special district electric utility debt outstanding, and 25 have less than \$10 per capita outstanding. However, nine states have more than \$300 per capita outstanding, and three states (Nebraska, Utah, and Washington) top \$1000 per capita. Another large category of special district debt outstanding is for water utilities. The heaviest issuers of special district water utility debt are in the Southwest and Rocky Mountain regions.

In sum, the demand side of municipal capital markets shows a wide variety of issuers issuing debt for divergent purposes. These issuers may be in competition with each other for scarce municipal capital. We next turn to the supply side of the market for municipal capital.

THE SUPPLY SIDE OF MUNICIPAL CAPITAL MARKETS

Who provides capital to state and local governments? The suppliers (buyers of municipal securities) have changed over time. In 1980, commercial banks were the largest buyers of municipal securities, holding 37% of outstanding debt; individual investors through direct holdings, mutual funds, and fiduciary accounts held 34%; property and casualty insurance companies held 22%; and other organizations held 7%. By 2000, the individual investor became the largest owner of municipal securities. Individuals owned 71% of municipal debt outstanding in 2000, either directly, through mutual funds (which grew from 2% in 1980 to 31% in 2000), or in fiduciary accounts. Property and

casualty insurance companies owned another 12% in 2000. Commercial banks fell to 7%, and other organizations rose to 10%.

Individuals

Individuals buy municipal securities most often because the interest paid on the securities is in general not included in the calculation of income on federal income tax returns. The size of these “tax preferences,” and how they impact various buyers of municipal securities, is often the driving force behind the supply of financial capital. The Sixteenth Amendment to the U.S. Constitution (which created the provision for the federal income tax) does not authorize tax exemption of municipal securities directly; rather Congress must provide it and budget for its effects annually. The original authorizing federal income tax legislation contained a specific exemption for interest on municipal securities. There have been various attempts over the years to tax municipal securities interest, although there have been none in recent years, and the constitutionality of the proposals has been hotly contested. In 1986, South Carolina contested the right of Congress to require that municipal bonds be in registered or book entry form to be exempt from federal income taxes (Congress had done away with the right to hold bond certificates, with their negotiable bearer coupons, due to concerns about the sale of coupons outside of the normal coupon interest redemption). The U.S. Supreme Court ruled against the state of South Carolina on that issue, and also ruled that Congress had the right to tax municipal bond interest if it chose to do so. Congress could also change major provisions of the federal income tax (for example, create a flat-rate structure) that would diminish or eliminate the tax preferences of municipal securities.^[4] In most states, the interest from municipal securities issued within the state is also exempt from state and local taxes. In addition, interest income derived from securities of the territories of the United States is free from federal, state, and local income taxation in all 50 states.

An example of the tax reduction for individuals helps to illustrate the advantages of municipal securities over taxable debt securities. Assume a couple with an income of \$155,000 (which puts them in the 36% federal income tax bracket) files a joint return. They have \$30,000 to invest and are considering two possible investments: a tax-exempt municipal bond yielding 5% and a taxable corporate bond yielding 7.5%. If the couple invested in the municipal bond, they would annually earn \$1500 and pay no federal taxes on that interest. The taxable bond would provide the couple \$2250 annually, but they would have to pay \$810 in federal income taxes on that interest every

year, so their after-tax earnings would be \$1440 (or \$60 less than the municipal bond). The tax-exempt bond would be an even better investment in a state that had an income tax and exempted municipal bond interest from taxation. Market participants often speak of the “taxable-equivalent yield,” which is the interest rate an investor would have to earn on a taxable bond to equal a municipal bond with a specific interest rate. (In our above example, the couple would have a taxable-equivalent yield of 7.8125% for a 5% municipal bond, taking into account only federal tax consequences of the investment decision.)

There are other tax provisions that are important to individuals as they consider municipal securities. One of these is the taxation of capital gains. While the interest on municipal securities is exempt from the federal income tax, any gains or losses realized from selling municipal securities are treated as taxable securities sales and are subject to the capital gains tax, either short or long (depending on whether held for longer than 12 months before sale). Capital losses may be applied to capital gains to offset the capital gains tax, however.

Another provision for individuals is that certain types of municipal bonds are taxable, and certain types are subject to the federal alternative minimum tax (AMT is a set of provisions that restricts the amount of tax-free income that can be derived by an investor). Private activity municipal securities (such as IDRBs) and certain refunding bonds (which in combination account for over 10% of all municipal bonds issued) are included in the calculation of the AMT. A further complicating provision is that for some individuals, a greater portion of their social security benefits can be taxed if they have tax-exempt interest. There are also special tax provisions for buying original issue discount bonds (bonds sold at prices far below their face value, for instance, a \$5000 face value bond sold at \$2000), bonds at a premium (bonds selling above face value), and bonds with a market discount (bonds sold below face value but not by as much as original issue discount bonds). Individuals may not borrow to buy municipal bonds, and annual municipal interest must be reported on their federal income tax returns.

Property and Casualty Insurance Companies

Property and casualty insurance companies also own municipal securities in order to take advantage of tax preferences. These companies need tax-exempt income as their business fluctuates. In years of poor insurance underwriting results, they have less need for municipal securities with their tax exemption in their insurance portfolio, because they can offset their net income with the underwriting losses. In good underwriting years, they need the municipal income from their insurance

portfolio to be tax exempt to maximize after-tax profit. Property and casualty insurance companies tend to favor long-term bonds and revenue bonds in order to increase the annual interest. In 1999, 24% of the assets outstanding of these insurance companies were in municipal securities.

Commercial Banks

Commercial banks own municipal securities for tax exemption as well. As noted above, their share of municipal capital supply dropped over 20 percentage points from 1980 to 2000. The Tax Reform Act of 1986 removed many of the tax incentives for commercial banks, and the ones remaining were difficult for large commercial banks to utilize.

Commercial banks still utilize municipal securities for two purposes. First, they can buy bank-qualified municipal securities into their bank portfolio, and the carrying cost is tax deductible. Bank-qualified municipal securities are general obligation bonds for public purposes of jurisdictions (or revenue bonds issued for non-profit organizations within their boundaries) that offer no more than \$10 million dollars in securities annually. Small banks utilize these bonds more than the large banks, because of their size. Second, banks will actually make loans to governmental units. This helps fulfill their requirements under the Community Reinvestment Act. Also, government loans are more attractive in credit markets, where there are few opportunities to extend credit with reasonable risk to businesses. Commercial banks tend to favor short-and medium-term securities that better match the maturities of their bank portfolios. In 1999, only 2% of commercial banks' assets were in municipal securities.

Other Organizations

The other organizations purchasing municipal securities are small companies, large pension funds, and hedge funds. Small companies that are owned by an individual may choose to use municipal securities for their tax-exempt nature. The case with large pension and hedge funds is quite different. These organizations actually monitor the municipal markets for discontinuities between rate patterns on municipal bonds and taxable treasury securities. They believe that the municipal market will tend to the norm, and they hope to capture gains on temporary discrepancies in prices from the actual value of the bond (this technique of exploiting temporary mispricing between different types of bonds is called arbitrage). Municipal futures and options can be used for leveraged-hedging (providing some insurance against falling bond or stock prices) and speculation. Futures are securities that

pay a holder the difference between the actual price of the bond or bond index and some future price. Options are rights to buy or sell a bond or an index at a specific price at some future date.

Other Factors Important to the Buyers of Municipal Bonds

For all municipal securities investors, the provisions of each individual bond will also determine their attractiveness beyond their tax preference. A security's stated interest rate, call features (calls are options that the bond issuer puts in the bond indenture that allow the issuer to redeem the bond at a given point in time at a specified price), source of repayment, credit rating, liquidity, maturity, general economic conditions, securities, market conditions, and the perceived credit quality and sector of the jurisdiction influence demand.

CONCLUSION

In short, many institutions and individuals comprise the municipal securities market: Governments and

associated special districts demand municipal capital by issuing municipal debt. The buyers of that debt, including individuals by themselves and through mutual funds, insurance companies, banks, and other organizations, purchase the bonds for tax preferences and as part of their overall investment strategy. Purchasing the bonds provides capital to governments for economic development, education, basic public services, and for other capital-intensive purposes.

Capital Programming and Budgeting: Comparative Local Government Perspectives

Costel D. Todor

Ministry of Justice, Bucharest, Romania

INTRODUCTION

One of the advantages of decentralized, autonomous local governments is that they should be able to plan and finance their own infrastructure and capital needs. To do this, they need capital budgeting processes that rigorously evaluate projects creating assets (those that meet useful life standards of 1–2 years, and cost threshold minimums) such as roads, water and sewer systems, solid waste, sanitation facilities, and projects for local economic development. Capital planning and budgeting “institutions” are the rules of the game critical to the success of local government programs. Program results typically depend upon the construction and maintenance of infrastructure. Institutional requirements include the efficiency of organizational processes, the efficacy of regulatory rules and systems, clear definition of management roles, and linkage of financial management processes and rules to service and program results. Such institutions are all critical to planning, financing, and implementing local capital programs.^[1] Based on training and technical assistance experiences overseas, particularly in Central and Eastern Europe, this article details 12 essential steps for the development of capital planning and budgeting systems.

CRITERIA AND STEPS TO STRENGTHEN LOCAL PUBLIC INVESTMENT INSTITUTIONS

Best international practices suggest that within a sound institutional framework there are 12 major steps that need to be followed in capital programming and budgeting (Fig. 1).

It is often tempting to think that additional funds can be used to avoid solving institutional problems that affect capital investment. The fallacy is that countries and cities can spend their way out of them. Almost 30 years ago, Caiden and Wildavsky^[2] pointed to the phenomenon of institutional “poverty” that

created revenue uncertainty and hindered fiscal management of projects. This was termed lack of “positive redundancy.” Absence of positively redundant institutions to identify and remedy problems can exist in the form of weak accounting and audit controls, lack of check and balance systems for regulatory oversight, and opaque and corrupt procurement practices. Such institutional weaknesses affecting capital investments can be found in the United States as well as in Honduras or Pakistan.

Step 1: Determine Organizational Structure

While there are several models available to determine the organizational structure, the one selected should ensure that the capital program and budget are based only on projects submitted by operating departments that meet economic [e.g., benefit–cost (B/C) ratios] and broader social criteria (e.g., water system project deemed essential to prevent risks to public health). The city will work out for itself the respective roles and responsibilities between the mayor’s office and the city council. Within the adopted structure, responsibility will be assigned to a unit (e.g., public works or budget office) for coordination of the entire 12-step process to ensure capital program implementation.^[3]

Step 2: Establish Capital Policies

The purposes of establishing clear written capital policies up front are: to facilitate planning and objective setting, to establish parameters for identification, ranking, and financing of projects, and to provide staff direction.^[4] These are advisory rules that citizens can use to hold officials accountable at the ballot box. They are not laws—which is very important for officials in rule-oriented civil law countries to understand (i.e., most transitional and developing countries). They are not laws to be circumvented or evaded that might be used as a pretext to send officials to jail.

Fig. 1 Steps in capital programming and budgeting.

The policies serve the objective of fiscal accountability and should serve to resolve important issues. For example, the city might be working from an overbroad definition of “capital” in its budget accounting system. This could allow deliberate misclassification of current expenditures as capital items to balance the annual budget and provide political cover for spendthrift local officials. A new policy might distinguish major maintenance/rehabilitation (a capital expense) from minor and routine maintenance (a current expense) by a monetary figure (e.g., minimum of \$10,000/task is a capital expense). Thus, as a policy matter, a city could use a dual definition of capital that: 1) requires a minimum cost; and 2) creates a non-recurring asset such as land, buildings, and equipment with a useful life of 1 or 2 years. This would prevent financing of current expenses through the capital budget with debt in order to hide fiscal deficits.

Step 3: Develop Forms and Instructions

In the third step, cities must develop appropriate budget calendars, forms, and instructions. In many transitional and developing countries, these requirements are fixed by the central government.^a Officials need to know that they can change some features, especially the calendar, and provide additional fiscal and performance results information in annexes and

on other forms. Local officials should be rewarded for generating additional decision-relevant information by having their overall reporting burdens reduced—through elimination of redundant forms. Central governments have been slow to reduce reporting burdens, which acts as a disincentive to producing modern performance data useful for management decisions. There are several criteria here. First, the calendar should ensure that capital programming ends prior to the beginning of the operating budget cycle.^b This allows more accurate forecasts of maintenance and debt service requirements before the operating budget is approved. Using a multiyear framework with a separate capital programming period facilitates integrated preparation of the capital plan and budget. This makes fiscal decisions more rational even if institutional responsibilities are separate—and even if the budgets themselves are published separately.^c Second, initial forms should provide basic data on proposed projects, such as need, costs, and conformity to local plans. This is not the formal appraisal stage; they are project profiles—rough wish lists by departments. The capital programming staff should provide pilot testing of any new forms and give training on form preparation. Successful capital programs, such as in the City of Milwaukee, have developed a quid pro quo mechanism that allows elimination of redundant forms in exchange for

^aFor Romania, see Ref.^[5].

^bIn Romania, the budget calendar is fixed as per Ref.^[5]. The new law provides for completion of capital programming before the operating budget cycle begins.

^cFor Romania, see Refs.^[5,6].

required generation of new data by line managers and acceptance of responsibility for project performance.^[7]

Step 4: Assess Capital Needs

Local governments with effective capital budgeting systems will have systems indicating when capital replacement is justified or not to satisfy citizen needs. Officials face a spate of competing project profiles from departments each year. Which ones should be put in the program and later financed by the budget? The first question to be answered is: Which ones meet both technical and social need criteria? Effective cities will have two databases in order to determine whether to: 1) repair existing facilities; 2) replace them with new capital investment; or 3) abandon the existing facility and forget replacement. First, cities will have a regularly updated technical inventory of the age and condition of all its capital facilities. These data should be regularly generated by engineering crews from surveys of pavement, road, school, hospital, and sewer conditions compared to industry standards. Second, cities will perform regular citizen surveys of facility condition and performance. This would record and analyze complaints on service interruption. The two databases often produce different results. Engineers would want to repair bridges and buildings until the designated replacement age; citizens might be tired of patchwork repairs and want a new facility to prevent safety problems. Local officials need both kinds of data and transparent criteria on which to base their decisions, i.e., keep repairing (preventive maintenance) or schedule for replacement.^d

Step 5: Analyze Financial Capacity

Cities also need capacity to finance projects that compete for budget shares with other services and programs. Cities in transitional and developing countries pay for their shares of most capital projects via cash financing. The bulk of capital large-project financing is still grants from the central government or external donor, e.g., European Commission Poland-Hungary Aid for Reconstruction of the

Economy (EC PHARE) or the European Bank for Reconstruction and Development (EBRD). As external sources dry up, cities will need to replace these funds with own-source revenues. One of the best sources of local financing for projects in Organization for Economic Co-operation and Development (OECD) or more advanced countries is credit. Larger cities in developing and transitional countries and medium-sized cities that demonstrate sound fiscal management also have borrowed from banks or issued debt in the form of bonds. Rating agencies, such as Moody's, regularly evaluate country sovereign bonds and use roughly the same criteria for sub-national issuers. The general categories are: 1) demographic health—age of population and workforce, and local and regional migration patterns; 2) financial condition—budget and revenue trend analysis, per capita debt as percentage of total revenues, debt service as percentage of total budget, and future debt capacity; 3) economic condition—per capita income, unemployment rates, and industrial trends; and 4) management performance—on-time approval of budgets, tax collection rates, and staff turnover.^[9] Evidence that cities are generating valid and reliable data in these categories and using them for management purposes invariably leads to higher creditworthiness ratings. Improved fiscal condition facilitates local infrastructure financing. Properly borrowed funds can reduce financing costs (since payments no longer have to be made by the end of the fiscal year) and permit reallocation of savings to other capital project and current service needs.

The stronger the financial condition as determined by these criteria, the easier it is for cities to borrow in the market for capital needs. Some countries, such as Romania, have growing local bond markets. More than 25 cities have issued and repaid their bond debts. At the same time, smaller and medium-sized cities have lower debt repayment capacities. Lending by banks to cities with little credit history and less financial management capacity is risky for both banks (which also have little experience in market-based lending) and the central government (since it could increase contingent liability and weaken its credit rating for sovereign bonds). Local officials are often unfamiliar with the mechanics of negotiating cheaper loans on the basis of good creditworthiness. For many years, they had been used to receiving subsidized credit from banks that they did not have to pay back on time (especially by loss-making city enterprises). They were also used to receiving capital grants from the central government for which they had only been responsible for covering maintenance costs. The problem is that local governments rarely covered maintenance needs.^e Cities have also been used to engaging freely in odd governmental accounting practices that hindered fiscal

^dMany cities lack inventories of existing assets or any systematic way of assessing facilities' conditions. By contrast, Milwaukee uses such mechanisms as its Pavement Condition Index (PCI), which allows it to set "outcomes" or results objectives, such as preservation of the quality of life with a 6.3 PCI rating. The 6.3 score represents a weighted average of technical/citizen survey results. Cities in transitional and developing countries would like to have more technical condition data but are reserved about citizen inputs in many cases. Using weighted averages can allay some of these concerns. See Ref.^[8].

transparency. For example, Japanese road corporations still count interest paid on loans to state banks as assets.^[11]

Step 6: Prepare Project Requests

Systems and procedures are required to evaluate project requests. Public works officials are often engineers or planners, especially in Central-Eastern Europe, meaning they like numbers (especially large construction budgets that keep everyone employed). Unfortunately, they have been rarely forced by local fiscal institutions to consider the opportunity costs of projects competing for scarce funds. The view by engineers in line ministries is that all capital projects should be funded immediately. In transitional countries, engineers have often been trained under the Soviet system and believe the numbers provide a scientific aura that will persuade European funding sources such as EC PHARE or EBRD to fund their projects. They do not consider that such donors have to choose between many worthy projects in many countries. Local planners and engineers have not yet learned that engineering statistics or B/C calculations alone rarely provide sufficient justification for project funding. Local officials in newly developing cities need to go through seven steps, none of which are purely technical:

1. Effective capital planning and budgeting institutions will define project objectives based on actionable problem definitions. If they allow the problem to be defined by the consulting engineer, this could eliminate feasible alternative solutions and increase local budget costs later. For example, while the City of Venice is sinking and the sea is rising, the consulting engineer defined the problem as the absence of expensive floodgates that the city should build and profit from. This should have raised warning flags in the city finance department.^[12]
2. Fiscal institutions will require rigorous analysis of alternatives via full review (including non-capital alternatives, e.g., enforce the leash laws

instead of building a new dog pound) and cost effectiveness—where the objective is given, such as better health care, and analysts find the most efficient ways to achieve this.

3. Project benefits will be estimated accurately. In contrast with the old Soviet norm-driven system, which used measures of physical capacity (e.g., beds per capita) to compute demand, Western analysts use market value and consumer surplus measures.^[13] Local officials will recognize that benefits estimates are not facts. Local officials also will adopt criteria that distinguish indirect from direct benefits. Including indirect benefits as direct benefits inflates the value of benefits and distorts overall project analysis (e.g., agricultural marketing and income benefits to farmers 800 miles away from a proposed barge canal).
4. Fiscal institutions will estimate project costs accurately to compare with benefits. Here, analysts need to measure total costs (direct and indirect) and opportunity costs (costs of alternatives not selected).
5. Before project costs are compared to benefits and placed in an overall program, local institutions will establish prior decision rules by which individual capital projects will be selected for the capital program. There are four major criteria: 1) the payback period—consisting of projections of net results with undiscounted costs and benefits; 2) B/C ratios—which weight the estimated costs and benefits for differences in timing and the time value of money; 3) net present value (NPV)—the monetary value or present worth of the project with discounted values; and 4) internal rate of return—the discount rate at which the B/C ratio is 1 and the NPV is 0. Most of these rules are useful for distinguishing large projects that have longer term construction schedules. They are less helpful in selection of smaller projects that are all needed by the community, e.g., water pipes, sewerage treatment, clinics, schools etc. Formal analysis of projects via one or more of these rules should be one of the criteria used to determine the final capital program.^[14] Thus, all project proposals should be subjected to formal economic analysis.
6. The next step in project analysis is to compare undiscounted costs and benefits (the payback method noted above). This produces preliminary estimates that are usually not sufficient for decision-making.
7. The last project analysis step compares discounted costs and benefits. City fiscal institutions will carefully review the discount rate used

¹¹The irrational split between fiscal authority and program management responsibility has been a major disincentive to capital maintenance in transitional and developing countries. Central governments tend to provide capital funds if the municipal units pay for maintenance of schools, hospitals, etc. In the United States, the same poorly design arrangement for intergovernmental capital financing can be identified in transit grants to cover buses and rail cars. When local governments fail to pay for maintenance, they can use new grant funds to replace the cars and buses. For further discussion of this problem see Ref.^[10].

by analysts. This is important since a low rate underestimates the value of current consumption or investment and favors long-term, large projects. The question is: What criteria should local officials use to select the discount rate? There are two major methods or criteria. The first, called opportunity cost of capital (OCC), focuses on profits, and the second, the social rate of time preference (SRTP), considers the welfare of future generations. The former methods normally produce a higher discount rate, meaning that opportunity costs of this public investment are higher and future benefits really need to outweigh the costs of alternative fund use to be approved (e.g., very high demand energy projects). A lower rate, often derived from the SRTP method, results in approval of projects that may not be profitable at all but will produce social benefits (e.g., water purification systems).^[15] Even in OECD countries, analysts use politicized or lower discount rate to generate higher B/C ratios. For example, a billion dollar rail project in one U.S. city used a 6% discount rate when the rate of inflation was 20%. Coupled with inflated ridership forecasts, the project was finally built and predictably benefited few people.^f The important point is that institutions must be designed to respond to powerful pressures by project advocates to distort figures in their favor.

Step 7: Review Project Requests

Cities with effective capital planning and budgeting systems have professional bodies to conduct at least four basic types of project review according to empirical data and professional standards: 1) administrative—all required forms, approvals, citizen surveys, environmental impact statements, and other compliance requirements have been met; 2) planning—fiscal and demographic impact studies have been performed, i.e., How much will supporting local services cost for this project? Is the project consistent with physical land use, sectoral, and city strategic capital improvement plans (CIPs)?; 3) financial—Have all capital costs been included in the proposal? Are costs and benefits properly estimated and measured? Has the fiscal impact on local tax rates been estimated?; and 4) engineering/architectural—Have

alternative approaches such as continuation of repairs been considered? Is the project construction schedule realistic? It is important that these issues be reviewed and checked off by appropriately qualified institutions before financing plans are made.^[16]

Step 8: Rank Project Requests

Next, cities rank the full list of approved projects, only some of which will be financed with limited funds available. The process of project appraisal and approval only produces a list of cost-beneficial projects. This is not the final capital program. Nor is it the capital budget. The list does not compare projects in different sectors with each other or indicate objectively which ones should be approved. Using B/C ratios, for example, one cannot compare the benefits of educated students and productive farmers with those of hospital patients receiving quality health care. Methods are used to approximate the comparative benefits of different projects for dissimilar groups. The ranking system used by many OECD cities adapts economic methods of interpersonal utility benefit models and marginal productivity curves to administrative practice. Consistent with this adapted method, to develop a capital program, the city needs to develop a rational system of transparent project ranking. Before projects are prepared and reviewed, the ranking system must be agreed upon by multiple stakeholders, including citizens groups, community watchdog groups, producers, and consumers.^g

Cities with effective capital systems make certain that local stakeholders agree on a weighted ranking system that incorporates multiple values and criteria. This may be the most difficult part of the entire capital planning and budgeting process. Personal, partisan, and institutional problems often combine here to work against modernization of the local capital budgeting and planning processes in developing and transitional countries. Some OECD cities use single standard systems, typically focusing on B/C ratios. The problem is how to use such ratios to compare the worth of projects in different sectors such as health and transportation. Many OECD cities use value categories, such as urgent (danger to health), desirable (to replace obsolete facilities), or deferrable (duplicates other projects). But on what basis can we achieve consensus on these categories among many community groups? Defining agreeable criteria for such categories as “desirable” projects could waste substantial amounts of time and political

^fMuch has also been written about the self-serving project analysis and review of the Dade County Metrorail system done in the 1980s. Low discount rates, high ridership projections, and lowball cost estimates by omission of costly items such as pedestrian bridges and sound panels produced a feasible-looking project for rubber-stamp approval.

^gSee Refs.^[14b,17].

capital. Thus, the multiple criteria approach used by most cities in advanced countries allows balancing of competing needs and efficiency-welfare values, such as economic worth, existing occupancy or user rates as a measure of need, fiscal and economic impact, health, safety effects, and environmental costs/benefits. Values and priorities are made explicit and quantified. City officials typically propose their own criteria (e.g., level of public supporting services required; availability of cost-sharing, and forecasted demand), weights for each criterion (i.e., facilities with poor existing conditions should receive higher weights than those in better condition), and scores from which to determine project rankings.^[14b] The framework has a strategic value in allowing more transparent cutbacks of projects in times of revenue shortfalls—or budget additions in time of buoyant revenues. While agreement on criteria and weights can be a lengthy and contentious process even before projects are inserted for overall scoring, many cities in advanced countries use this approach.

Step 9: Evaluate Financing Options

Cities with effective capital planning and budgeting systems develop financing packages consisting of multiple sources of project finance. The ultimate mix of grants-loans will be affected by the fiscal condition of the city, noted in Step 5. Cities typically develop mixes of current pay-as-you-go and debt funds to pay for their projects. Poorer cities such as Milwaukee rely on self-supporting debt (enterprise funds, special assessments, and tax increment districts) and cash-tax levies (mainly for small works such as neighborhood alleys and street lights) along with central transfers to finance about 45% of their infrastructure needs.^[18] The rest is covered by tax-levy supported debt, meaning general obligation bonds. To issue bonds, the city has to maintain a solid credit rating based on demonstration of sound financial condition. In the case of Milwaukee, financial officials were able to counter low per capita income and sagging economic growth data with evidence of strong financial management controls and predictable budgets. This produced a relatively high credit rating by Moody's and allowed them to issue debt at lower interest rates and yields (lower financing costs) than if they had received a lower rating.

Cities can also combine current tax revenues with creative approaches such as leasing or use of build-operate-transfer (BOT) contracts to obtain both capital financing and operating expertise.^h Depending on their relative fiscal condition in the hierarchy of municipal finance, cities in developing and transitional countries also: 1) borrow from municipal development banks at subsidized rates; 2) borrow from

suppliers/vendors at usually high rates; or 3) issue bonds or borrow from commercial banks if they are in the category of advanced cities. More advanced cities (meaning those with experience and skills in financing—not necessarily the wealthiest cities) use innovative financing packages that include such vehicles as tax increment financing districts (TIFs or TIDs). TIDs are city economic development districts that pay back the principal and interest on debt issued for new facilities and improvements within their boundaries from the expected increase in property values within those districts. Also called “betterment districts,” Milwaukee has established over 50 of these since the 1970s.ⁱ In short, city officials need to improve skills and systems for generation and analysis of fiscal data. This will allow them to compare financing options in order to minimize burdens on their budgets while maximizing the number of projects they can finance.

Step 10: Draft Capital Program and Budget Documents

Cities must draft and disseminate the capital program and budget in transparent budget documents. The goal should be to explain how the 5 to 6 year capital program links to its first year of financing through the capital budget and to indicate what results can be expected. This cannot be accomplished by presenting reams of accounting figures and budget laws. Despite the limited public audience for such documents (which is an implicit purpose of this approach), many transitional and developing country cities still do this. For transparency, it is essential that the city adopt a budget structure and format that simplifies and explains fiscal information to the reader. Public finance officials, especially accountants, seem to have a difficult time doing this. As a result, budgets are greeted with suspicion in many cities by community stakeholders and the media. Lack of transparency—presentation of figures and their meaning in plain language—is an important reason for the often ferocious conflicts between city councils and executive/mayor offices over financial issues. Skills are needed to combine fiscal data and narrative explanation. In many cities, too many data are available, which encourages officials to bombard the public with fiscal data that have not been clearly translated into meaningful information. This can stifle interest in and debate on budget matters and decrease public sector accountability.

By contrast, some cities in transitional and developing societies have developed capital improvement

^hSee Refs.^[18b,19].

ⁱRef.^[18a]. See also Ref.^[20].

programs and budgets consistent with the highest OECD standards.^j

As a leading U.S. example, the annual Milwaukee budget provides basic annual data in a user-friendly format that can easily be copied elsewhere.

The presentation consists of two parts:

1. The budget is prefaced by a transmittal letter from the mayor to the council. Some cities also publish the approved final budget with a letter from the chair of the council finance committee. It is important in these letters to describe revenue and expenditure trends, capital policies, factors considered important in setting priorities, percentage of projects by category, financing sources, changes from past year (e.g., projects dropped), unmet needs (e.g., deferred maintenance), and results of citizen surveys. The finance office should summarize here the information noted in the previous nine steps for use by the media and the public.^[18a]
2. The Milwaukee budget provides highlights and summary schedules of each project by department, purpose, special fund, priority, future costs in debt service and maintenance, and financing source. The Milwaukee budget consolidates the revenues and expenditures of all units of city government, including special authorities, extra-budgetary funds, and city enterprises. It is important to link current and capital budgets together (e.g., break out personnel costs, debt service, and maintenance related to capital expenditures).
3. The City of Milwaukee uses a unique approach that combines current and capital expenditures in relation to defined “outcomes” or programmed results measures. The integration is logical in that particular capital facilities, such as hospitals, are supposed to provide quality patient days. Since this outcome is a combination of current and capital expenditures—functioning equipment, available medicines, and trained personnel—it is important to measure capital expenditures with a results-oriented framework similar to this. For example, the Milwaukee water department is required to report on and respond to the “percentage of main water breaks back in service within 24 hours.”^[18a] The budget indicates that the department could not produce this outcome in fiscal year 2003, which called attention to an aging capital stock

(pipes) and the questionable efficacy of its maintenance program. The outcomes budget format allows the city department to be held accountable by elected officials and the public; it also allows the department to use its information to request more funds for capital and current items.

Step 11: Adopt Capital Program and Budget

The city then adopts the capital program and budget.^[22] City governing bodies need to have time for review of the proposed program and first-year capital budget. Time is required for inputs via citizen surveys, citizen review on capital program committees, and public hearings. After review, the governing body follows one of two courses: 1) adoption of the capital program and 1-year capital budget; or 2) adoption of the capital budget only. In the second case, some city governments fear being locked into a multiyear program of expenditures. The way out is to adopt policies that indicate that the capital program is a rolling plan that each year (in some cases every six months) will be rolled forward to take account of changes in both financial projections (e.g., revenue shortfalls) and the project portfolio (deletions, modifications, additions). In this way, the government is free to modify the program based on regular reconciliations of plans and budgets.

Step 12: Implement, Evaluate, and Monitor Capital Budget

Following approval, cities will monitor and evaluate the progress of their capital budgets. Sound project management and financial control is essential for the best project results. This is difficult to achieve even in advanced countries, and cities must constantly review their capital implementation institutions to ensure proper functioning. For example, the City of Milwaukee faced regular cost overruns and conflicts over change orders that were driving up project costs. The capital budget noted that authority and responsibility for project design/construction and oversight/accountability were divided between the Public Works Department (DPW) and the Budget Management Department (BMD), which had led to major communication and control problems. As indicated in its budget, Milwaukee recently adopted a new approach that centralized normative control of capital account management in the BMD (requiring individual departments to report regular fiscal and physical progress of projects), centralizing project design/construction management in DPW, and decentralizing expenditure authority to the individual departments to take

^jSee for example Ref.^[21], which includes a multiyear projection of borrowing and debt service requirements through 2008.

responsibility for projects in their sectoral areas. Thus, dual project oversight is provided by DPW–BMD.^[18a]

SEQUENCING CAPITAL PLANNING AND BUDGETING REFORMS—CONCLUSIONS

It should be clear from reviewing the 12 steps that the most difficult question is how to design them and to sequence their installation. Because of resource and absorptive capacity constraints in most countries, it is impossible to do everything at once. Based on overseas experience, implementation of a capital programming and budgeting system should likely follow this four-step sequence:

1. The city should fix the organizational framework. Cities need to clarify planning and implementation responsibilities and eliminate negative institutional redundancies, such as excessive approval steps that produce corruption opportunities and drive up project costs. Cities should perform reviews of core transactions in capital planning, such as project approvals and contracting, to ensure that these processes are performed as efficiently as possible.
2. Professional management skills need to be improved. Managers should have the skills (as well as the authority) to analyze project proposals and develop weighting and scoring matrices from which to develop overall capital programs.
3. Capital plans and budgets should be integrated with the current budget process in a multiyear framework. This allows the finance department to oversee planning of the capital program and to ensure that financing is available for future years to cover maintenance and debt service requirements.^[23]
4. Cities need to improve their practices of municipal budgeting and financing. This means more than just installation of computerized accrual accounting and integrated procurement and budgeting systems. Officials need to know how to operate and modify such systems to meet their future needs. They also need to know how to apply innovative options for project financing, such as leasing, tax increment districts, and note/bond relationships with commercial banks.

Capital Purchases

Wendell C. Lawther

Phoenix, Arizona, U.S.A.*

INTRODUCTION

Capital equipment is usually defined as any equipment with a useful life of at least three years.^[1] In the public sector, it is usually funded by the capital budget. In many ways, capital purchases differ from purchase of services and other relationships defined by contracts between public sector agencies and private vendors.

These differences often produce controversial issues that the purchasing staff must face in buying this equipment, often coming into conflict with the agency that requests the equipment. First, there is conflict between those who wish equipment with the latest technological advances and those who argue in favor of the equipment with the lowest price. Although this equipment may be more expensive and the use of the new technology cannot be fully justified by the using agency, the attractiveness of owning the fastest personal computer in anticipation of future uses is very appealing.

Second, ignoring the issue of productivity may result in purchasing inappropriate equipment. Part of the analysis in deciding what equipment to purchase depends upon how the purchased equipment impacts productivity. To achieve this information, outputs of the equipment must be identified and analyzed. The number of copies per minute for a copy machine, as well as the number of copies made by a using agency should both be identified. In this manner, a unit cost—cost per unit of output for a given time period—is calculated. The purchase of more expensive equipment may not be justified if the unit cost is much higher than that of less expensive equipment. This may be the case if the number of outputs and the resulting productivity of using the equipment is low.

Third, life cycle costing (LCC) assesses the total cost of owning, operating, maintaining, and disposing of the equipment. As early in the acquisition process as possible, LCC should be performed. The lowest initial cost equipment model may not be the wisest purchase because repair and maintenance costs may be higher than a more expensive model.

The increased technological advances for equipment such as personal computers and customer service systems based on on-line access have significantly altered

the capital purchasing process. As writing specifications for such equipment may be difficult, as in-house purchasing staff may not have sufficient knowledge to do so, obtaining the equipment relies more heavily on processes such as Invitation to Negotiate (ITN) in which the purchasing process is very different from the acceptance of the lowest cost item.

THE CAPITAL PURCHASING CYCLE

An overview of the procedures and methods used in purchasing capital equipment will help to illustrate the unique aspects of capital purchasing. Because the process repeats itself as old equipment is replaced, it is most accurately viewed as cyclical in nature.

Need Determination

Various factors contribute to determining the need for capital equipment. Changing service or workload may require additional equipment to maintain acceptable levels of productivity. Advances in technology may make the currently operating equipment obsolete because it cannot maintain new standards of responsiveness.

Also, accompanying a replacement policy and set of procedures are decision rules chosen by an agency that identifies the need for new equipment to be purchased (or leased). For example, when the cost of repair reaches 60% of the value of the equipment, the agency may determine that replacement is necessary. Police vehicles may be replaced after 80,000 miles of usage.

Planning and Budgeting

Depending on the requirements of the budgeting process of the government, capital equipment needs must be identified one or two years into the future. In many cases these needs must be prioritized, justification provided by the using agency, and funds identified to support the purchase. The impact of the capital purchase on the operating budget is usually part of the projections that need to be made.

Specification Development

A specification is a description of the physical and/or functional characteristics of the equipment to be purchased. It may include the requirements to be met by the equipment and the procedures used to assess whether these requirements have been met.^[2] There are many aspects to developing specifications that provide challenges to the procurement official. First, the specifications should not be restrictive so that competition among potential suppliers is not dampened. Second, the use of brand names may be too restrictive and should be avoided unless it can be justified by the using agency. The purchasing official must guard against the possibility that the agency has been persuaded by sales personnel that their brand is superior.

The issue of standard specifications vs. customized specifications must be resolved in many instances before purchasing can proceed. The using agency may request more customized equipment, stating that “it’s our money.” Unless a specific need can be identified, it is the role of the purchasing official to explore with agency personnel using standardized specifications as much as possible. The more standardization that is possible, the more “off-the-shelf” software and hardware, for example, can be purchased, usually at a lower cost to the government.

In some CE areas, such as the purchase of information technology (IT) and related telecommunications products, the fast-changing technology may make it difficult to identify and write accurate descriptions of what hardware and software is needed to meet a customer service need. In the field of advanced traveler information systems, for example, governments have had to state the goals of the system they wish to acquire without detailed specifications identified. It is expected that with this ITN or similar purchasing process, that specifications will be identified as a result of a negotiation among purchasing and agency personnel and potential suppliers.

Sourcing

This part of the process involves identifying and maintaining a list of those vendors or suppliers that produce or can obtain the required equipment and would respond to an invitation to bid (ITB), request for quotation (RFQ), or request for proposal (RFP) provided by the government. To maintain competition, the list should be updated as much as possible by adding new vendors. Purchasing staff can obtain these from agency personnel who are more likely to be in contact with relevant vendors. Also, those suppliers who have failed to respond to an ITB or who have provided

unsatisfactory performance should be removed from the list.^[3]

In many cases bidders are required to pre-qualify. This process not only is more efficient for the purchasing department, as vendor qualifications do not have to be reviewed after every bid award. It also facilitates the bid review and award process by assuring that all vendors considered have the capability to provide the equipment as required.

Source Selection

The process of selecting which equipment to buy is different for capital equipment compared to purchasing services or other supplies. No matter what source selection process is chosen, there is likely to be more negotiation with capital purchases. Other items are consumed relatively quickly after purchase, while capital equipment may be with the agency for years. Even if standard specifications can be chosen for the equipment, and an ITB, RFQ, or RFP is used, there may be the expectation by the supplier that a counteroffer from the government or agency will be forthcoming, and that negotiation will resolve differences.^[1]

If the equipment is customized, or complex enough so that specifications cannot be written in great detail, or part of a larger system, e.g., information technology, a RFP or invitation to negotiate may be the source selection process chosen. These are multistep processes that may involve extensive negotiation with more than one vendor. Usually, there is a proposal review process that involves creating a bid rating scale, establishing a team of raters from purchasing, the using agency, and from other governments or agencies, and prioritizing the bids received.

At the highest degree of complexity, when the agency goal or problem is clear/well-defined but the equipment and the means to accomplish that goal are unclear, the agency may use the source selection process to assist it in choosing the means. The Commonwealth of Kentucky, for example, has established a pre-qualification process for obtaining agreements with information technology. As of fall 2000, 15 IT vendors were pre-qualified: 5 for “full-service” while the other 10 fill specific niches. Once private vendors are qualified, then any state agency sends a letter to all vendors outlining the problem that needs to be solved, and inviting vendor to propose solutions. If there is an interest, negotiations begin. The final result is a fixed price contract, with specific deliverables identified.

Contract Administration

This function ideally should be performed by a team of purchasing and agency personnel. The activities

involved are similar to the administration of all contracts, including 1) monitoring the delivery of equipment to ensure that it is provided in a timely fashion according to the dates specified in the contract; 2) resolving problems/complaints if deadlines are not met and/or equipment does not meet specifications; 3) assessing the capability of the supplier to provide the equipment as required; and 4) assessing penalties or other sanctions including termination of the contract.

In the case of capital equipment, however, there must be a process testing the delivered equipment to ensure that it produces the required output. In addition, administering the warranty, including knowing when and under what conditions the warranty applies, is part of contract administration.

Maintenance and Service

The primary decision rules adopted by the agency pertain to the use of routine or preventative maintenance (PM). Without such maintenance, the equipment is repaired when it fails to operate. This is known as failure maintenance (FM).

The obvious benefit of PM is that frequent usage will extend the useful life of the equipment. The assumption here is that the more funds invested in PM, the lower the costs of FM. Failures will be less frequent, and resulting downtime less costly as well. Preventative maintenance costs include the cost of materials, the time/salary of those performing the repairs, the cost of spare parts that may be installed, and the downtime of the equipment while being maintained.

The issue of downtime becomes important in determining the usefulness of PM. In many cases, the cost of downtime is negligible. Alternative equipment may be available. If a personal computer needs PM for one day, email may be accessed via another computer. A laptop computer may substitute for the PC. If a vehicle is “in the shop” for PM, work can be rescheduled or another vehicle may be available. If downtime incurs realistic costs, however, and requires renting replacement equipment, then these costs must be factored into the need for PM.

An opposing view is that PM is not needed. When the equipment fails, it should be repaired at that time. This approach can be adopted under certain conditions. If the assumption expressed above about PM is not accurate: increased PM does not lessen or has little impact on the cost of FM, then PM may be of little value. Preventative maintenance for a personal computer may have little bearing on whether a hard drive crashes.

A second condition is relevant to the value of the equipment when FM is likely to be necessary. If the value depreciates quickly, so that when the equipment breaks down the cost of repair is a high percentage of its value, then replacement instead of repair is a more feasible option.

Replacement Planning

As indicated above, many agencies have a replacement plan or policy in place that will start the purchasing cycle. Decision rules exist that are often implemented based on industry standards and/or past experience. These will trigger replacement of existing equipment. Agency or government committees may be established to monitor and oversee vehicle and equipment replacement.

Disposal

In many respects the capital purchasing cycle ends and begins again with the disposal of the equipment and the planning for its replacement. There are several disposal options available, including 1) trade-in for new equipment; 2) sell to a used-equipment buyer; 3) used for spare parts; and 4) pay to have the equipment removed.

The option chosen depends upon the availability of a market for the used equipment. In some cases, if upgrades have been added to the equipment over its useful life, it may be worth more when disposed than its initial cost.

CONCLUSION

With the need to purchase computer hardware and software, especially in the context of creating information technology systems, the importance of capital purchasing has risen dramatically. The stakes are higher, as the risk of failure increases with the complexity of the equipment purchased. Countless numbers of examples are similar to the following instance.

Florida state legislators plan to audit a child welfare computer system that is seven years behind schedule and more than \$200 M over budget. The system, designed to replace paper files and several separate computer systems that track abused and neglected children in Florida, was first approved by the legislature in 1990. It was originally supposed to be completed in 1998 at a cost of \$32 M. It is now scheduled to be completed in 2005 and cost nearly \$232 M.^[4]

The greater need for a partnership approach to capital purchases is evident from this example.^[5] Public sector purchasing and agency personnel need to partner

with private vendors so that the requisite knowledge needed to accomplish the goals is shared by all. Problems need to be identified early in the implementation process, and solutions sought with the input of all concerned to avoid waste, delays, and cost overruns.

Career Development

Teva J. Scheer

University of Colorado at Denver, Highlands Ranch, Colorado, U.S.A.

INTRODUCTION

Career development is the process of setting developmental goals and of identifying training and other developmental opportunities that will achieve those goals. An organization's human resources programs should include a career development system that helps individual employees to meet their own development goals within the context of the organization's goals and training needs. This section explains the components of an organizational career development system, lists the individuals or organizations with responsibility for the career development system, and discusses a variety of career development tools.

WHAT IS CAREER DEVELOPMENT?

In its simplest terms, career development is the process of setting developmental goals and of identifying training and other developmental opportunities that will achieve those goals. Any person can complete these activities individually. However, within the context of a public organization, a career development system exists to meet the knowledge and skill needs of the entire agency. The individual's development needs are still met, but within the larger context of the organization's goals and objectives.

To be effective, an organization's career development system must be integrated with the other components of the human resources (HR) program. The agency's recruitment and selection system is a major source of job analysis information which should be fed into the identification of training needs, both to provide entry-level knowledge and skills and to prepare current employees for higher-level opportunities. The agency's position management system can provide detailed information about occupations, which can be used to develop standard career paths and succession plans. The agency's performance management system can provide information about mastery levels in all occupations; this information should be used to identify gaps between current and optimum levels of performance. And the agency's long-range planning processes can provide information about future skill needs and the growth or erosion of occupations and/or functions.

Career development is a balancing act between two sets of values: those of the organization and those of the individual employees. Since training is an organizational investment, the agency's values "trump" those of the individual employees. For example, if a state park sets an annual goal to insure that all rangers will become efficient in fire suppression techniques, then an individual ranger's personal goal of studying wildlife management will likely need to be deferred. However, the closer the agency's developmental goals are to those of its employees, the more likely that the career development efforts will be effective.

CAREER DEVELOPMENT RESPONSIBILITIES

The responsibility for career development is divided between three groups: the HR organization on behalf of the agency; the managers; and the employees.

The HR organization is responsible for making sure that managers and employees have the information they need about the agency's long-range plans, e.g., staffing projections, performance goals, planned initiatives, and any expected changes in agency mission. Ideally, HR will house a career center, where employees can access career planning literature, obtain personal career counseling, and complete instruments such as skills assessments. Human resources also may serve as the clearinghouse for developmental opportunities available throughout the organization. Most HR organizations also host periodic events for employees, such as internal career fairs and presentations on application procedures, individual development plans, and effective interviewing. Finally, HR is responsible for assisting managers in carrying out their development activities.

Managers are responsible for assisting their employees in the career planning process. They need to communicate regularly with employees about their performance, their developmental needs in their current jobs, and their long-range planning for future jobs. They need to work with their employees to develop individual development plans. They are responsible for helping employees to identify appropriate training classes, for securing the necessary funding, and for relieving employees of their workload during the training period. They are responsible for devising

assignments on the job that will build new skills or enhance current ones, and they are also responsible for finding details outside the current organization in accordance with the employees' individual development plans. Ideally, they will become their employees' career coach and mentor, or they will arrange for another mentor as appropriate (i.e., if an employee's career objective is located elsewhere in the organization).

Employees are responsible for clarifying their own career goals and for helping their managers to identify their current and future training needs. Employees need the cooperation of HR and of their managers to meet their developmental goals, but they need to take primary responsibility for their own careers. If a manager lacks the time or the temperament to be an involved mentor, then employees need to take the initiative to ask for performance feedback, to identify appropriate training opportunities, and to discuss their development plans with the manager.

CAREER DEVELOPMENT TOOLS

Agencies have a variety of tools available to them to help plan and administer their career development programs.^[1]

1. To assist in the organizational planning and goal-setting that should precede individual development efforts, agencies can use work plans, agency planning documents, budgets, auditors' reports, and feedback from outside the organization (e.g., city manager directives, Congressional hearings). If the agency has not conducted an internal skills inventory, either a contractor or the in-house position management staff can conduct a study of existing vs. future skill needs.
2. Once the long-range development plans have been developed, the focus turns to individual development. Available self-assessment tools include career planning workshops, assessment centers, and the use of instruments such as the TriMetrixT System Personal Talent Plus Report, the Hartman Kinsel Profile Report, or the Myers-Briggs Type Indicator. Instruments and

questionnaires can help employees to identify their style preferences, career priorities, performance strengths, and training needs. Many books on career planning contain simple questionnaires or sample developmental plans that managers and employees can adapt to meet their needs.

3. The employee may receive individual counseling from the manager, an assigned mentor, the HR staff, or a professional career counselor, internal or external to the organization. Specialized referrals can include professionals in outplacement and employee assistance (e.g., financial counseling, family issues, or substance abuse, which affect on-the-job performance).

THE CHALLENGE FOR TOMORROW'S ORGANIZATION

Many 21st century organizations are becoming flatter and lowering their spans of control. They are also more likely to contract out for special skills or projects in order to increase their flexibility and reduce their staff costs. Employees will need to keep in mind that career development is no longer limited to advancement to higher-graded positions in the current organization. They will increasingly need to focus on lateral placement or movement outside the current organization. The challenge for organizations with reduced opportunities for advancement will be to show their valued employees how lateral moves can benefit their careers.

Cash Flow Forecasting: Principles

William R. Voorhees

*Department of Political Science and Public Administration, University of North Florida,
Jacksonville, Florida, U.S.A.*

Jeongwoo Kim

School of Public Affairs, Arizona State University, Phoenix, Arizona, U.S.A.

INTRODUCTION

Management of cash flow is extremely important to the fiscal efficiency of governments. This importance is underscored by the fact that most general-purpose governments in the United States generate their budgets on a cash basis, even though they are accounted for on a modified accrual basis.

At least three different terms are used to describe this process, “cash budgeting,” “cash flow budgeting,” and “cash flow forecasting.” Each of these terms may be used with slightly differing connotations. In the finance field, cash budgeting is considered a part of the master budget, which includes the operational budget and the capital budget; however, in the political science field, cash budgeting is the process of making the cash appropriation for the yearly budget.^[1,2] In the former case, service-level assumptions are assumed and the cash flow is calculated. In the latter case, the process starts with the appropriation and the service levels are a function of the appropriation. This article will assume that policy drives appropriation and that service levels are set requiring the cash flow for operating at a given service level to be calculated. To avoid confusion, the term cash flow forecasting will be utilized throughout this article.

THEORY OF MANAGING CASH FLOWS

Good financial management seeks to optimize the cash flow of receipts and minimize the cash flow of disbursements, thus maximizing surpluses or minimizing deficits. When the timing of cash receipts and disbursements is considered, it is easy to see how budgets for identical gross amounts may not yield the same results in resource utilization. This is due to the time value of money. Budgets that have accelerated disbursements and decelerated receipts will be less efficient than budgets with decelerated disbursements and accelerated receipts. The cash budget is the tool of choice for managing the timing of receipts and disbursements.

Consider the following two cash budgets, both with appropriations and receipts in the amount of \$10 million (see Table 1). In the first case, an inefficient budget is presented, in which all \$10 million of the receipts are collected in the last month of the budget and all of the expenditures are disbursed in the first month of the budget year (12mo earlier). In this example, the community must borrow funds in order to pay the disbursement in the first month, because no current revenues are available. Utilizing a 6% discount rate and converting the budgeted amounts to future values [Eq. (1)] for comparison, it is discovered that the jurisdiction of the first budget actually had a deficit when the amounts are adjusted for the time value of the money.

$$FV = \frac{\$10,000}{\left(1 + \frac{0.06}{12}\right)^{12}} = \$10,617 \quad (1)$$

The second budget, on the other hand, collected all of its revenues during the first month of the budget year and disbursed all of its expenditures in the last month of the budget year, resulting in a surplus of \$617,000. By investing the revenues at the market rate, the second jurisdiction was able to generate an additional \$617,000 in revenue, resulting in a surplus.

Even though both of the budgets had appropriations of \$10 million dollars, the first community received considerably less in value from their appropriations than the second community. Naturally, these are exaggerated examples, but the basic principle of maximizing the time before disbursement of expenditures and minimizing the time in collection of revenues is fundamental for every financial manager. The concept of efficient cash management is, of course, taken from the perspective of the government and not individual citizens or vendors.

In reality, one would expect revenue receipts and expenditure disbursements to occur periodically throughout the budgetary year. For example, the majority income-based taxes are usually collected in

Table 1 Cash budget efficiency and inefficiency

Numbers in thousands	First month of budget (\$)	Last month of budget (\$)	Time value-adjusted budget (\$)
<i>Community 1—inefficient</i>			
Receipts		10,000	10,000
Disbursements	10,000		10,617
Deficit			−617
<i>Community 2—efficient</i>			
Receipts	10,000		10,617
Disbursements		10,000	10,000
Surplus			617

the first part of April. Depending on the jurisdiction, property taxes may be due in a lump sum or in prorated amount over the year. Because the collection of these taxes are not synchronized to the disbursement of the funds for goods and services these taxes are designed to support, additional costs or revenues may be realized. The ability to identify these costs or revenues on an interim basis allows managers to make corrections to fiscal policy decision, in order to optimize resources.

In the case of departments that provide a significant part of their services on a fee for service basis, such as water and waste departments, the cash flow forecast allows these departments to minimize the lag time between service provisioning and collection of the fees for the service. In order to maximize fiscal resources, some departments have even required citizens to pay in advance for services rendered.

An additional benefit of the cash flow forecast accrues when laws require that budgetary allotments be utilized. An allotment is the periodic release of funds to a department for expenditures. For example, if a department has a \$12,000 budget, they may only be allowed to spend \$1000 per month, ensuring that there will be funds for the entire year. Good cash flow forecasting provides a valuable tool for managers to determine if they need special exemptions made for even allotments.

MECHANICS OF CASH FLOW FORECASTING

Cash flow forecasts are based on the likely pattern of receipts and disbursements over a period of time and are used to determine the daily, weekly, monthly, or yearly cash position of the government. Following generally accepted accounting principles for reporting of cash flow statements, this article presents the cash flow forecast in the same format as is found on a governmental financial statement.^[3] This cash flow forecast

is typically composed of six elements: cash flows from operating activities; cash flows from non-capital financing activities; cash flows from capital and related financing activities; cash flows from investing activities; net monthly cash change; and new financing needs.^[4]

Cash Flows from Operating Activities

The formulation of the cash flow forecast is a multifaceted process. This process begins with analyzing the existing patterns of cash inflows (receipts) and outflows (disbursements) from operating activities, based on accounting records. For receipts, revenue sources, amounts, and payment dates are examined to determine when the posted revenue is converted from an accounts receivable into a cash asset. For disbursements, billing amounts, billing dates, and payment dates are likewise examined to determine the conversion of an accounts payable into an actual cash outflow. The historical behavior of the receipts and disbursements is then utilized as the foundation for forecasting future cash in- and outflows.

To demonstrate the construction of the cash flow forecast, consider a water service department (see Table 2). The cash flow forecast of the water service department is begun by estimating the charges for services for each month. The department's revenues are mainly derived from fees and service charges assessed to residential and commercial customers of the city's water and wastewater systems. Based on past experience, the department expects to collect 50% of all charges in the month they occur, 35% within 1 month, and 15% within 2 months. Once the cash collections have been calculated from the forecasted revenue for each month, the total receipts can be calculated. To calculate collections for September, for instance, the department would determine 50% of its current charges ($\$2,115,900 \times 50\% = \$1,057,950$) and add 35% of August charges ($\$3,526,500 \times 35\% = \$1,234,275$) and 15% of July charges ($\$3,056,300 \times 15\% = \$458,445$) for the total collections of \$2,750,670.

The second component of the cash flow forecast is the anticipated cash disbursements. A detailed understanding of the payment schedule for expenditures is of utmost importance in calculating disbursements. For example, supplies may be purchased on accounts payable at the beginning of each month but not paid until 30 days later, in accordance with trade credit terms. Of course, a good cash manager will attempt to delay disbursements as long as possible, by utilizing the optimal terms of available trade credit.

In Table 2, total disbursements for September are \$1,812,000. The total operating activities cash flow for September is calculated by subtracting

Table 2 Example cash flow forecast

Quarterly cash budget for water service department								
	May	June	July	August	September	Total budget	Actual	Variance
<i>Cash flow from operating activity</i>								
Charges for services (\$)	2,300,000	2,950,000	3,056,300	3,526,500	2,115,900	8,698,700	23,505,000	14,806,300
Receipts								
Current month collections	50%		1,528,150	1,763,250	1,057,950	4,349,350	11,754,500	7,405,150
Previous month collections	35%		1,032,500	1,069,705	1,234,275	3,336,480	8,273,000	4,936,520
Second previous month collections	15%		345,000	442,500	458,445	1,245,945	3,573,000	
Total receipts			2,905,650	3,275,455	2,750,670	8,931,775	23,600,500	14,668,725
Disbursements								
Personal services			677,000	717,000	597,000	1,991,000	7,003,000	5,012,000
Materials and Supplies			325,000	375,000	225,000	925,000	2,499,500	1,574,500
Fees and services			1,170,000	1,350,000	810,000	3,330,000	8,999,000	5,669,000
Other			260,000	300,000	180,000	740,000	1,979,000	1,239,000
Total disbursements			2,432,000	2,742,000	1,812,000	6,986,000	20,480,500	13,494,500
Total operating activities cash flow			473,650	533,455	938,670	1,945,775	3,120,000	1,174,225
<i>Cash flows from non-capital financing</i>

Excess cash		1.2%							

total disbursements from total receipts (\$2,750,670 – \$1,812,000 = \$938,670).

The management of cash flow is the practice of accelerating cash receipts and decelerating disbursements. To accelerate the receipt of revenues, the government can utilize techniques such as earlier billing, prompt payment discounts, and late payment penalties to improve revenue flows. Collection acceleration can often be improved by reducing the time between a payment, typically in check form, and the point in which the payment is converted to cash and the government has use of the funds. This is called collection float. Lockbox systems, electronic fund transfers, and accepting credit cards for payment are all proven techniques for reducing collection float.^[5]

Like acceleration of collections, the government can minimize disbursements to optimize cash flows. A variety of ways have been suggested for disbursement management.^[6,7] First, pooling cash balances into a central concentration account improves management by consolidating funds at a single point. Centralizing disbursement also permits more efficient monitoring of payables and float balances. Second, zero-balance accounts (ZBA) are special disbursement accounts having a zero-dollar balance for the

government's expenditures. ZBA simplify the control of disbursements and cash balances and hence reduce the amount of idle cash. Third, expenditure controls can be used to track and brake unnecessary early payments. Finally, employee payment periods should be standard and as long as feasible. Using periodic payment dates can reduce processing cost and increase the predictability of payment amounts and the time availability of money.

Cash Flows from Non-Capital Financing Activities

Cash flows from non-capital financing activities are tracked separately from operating activities. These activities include expected receipts from grants or subsidies other than those specifically restricted for capital purposes or those for specific operating activities and grants or subsidies expected to pay to other governments, funds, or organization, except payments for specific operating activities of the grantor government. To control disbursements, discretionary payments such as grant payments or shared revenues should be delayed as much as reasonable.

Cash Flows from Capital and Related Financing Activities

Cash flows from capital and related financing activities include proceeds of debt attributable to acquisition of capital assets, receipts from the sale of capital assets, and payments to acquire capital assets. The payments of long-term obligations follow a more predictable pattern. In the example, total financed amount is \$65,000,000 at the rate of 6%, and bond proceeds are scheduled to pay twice a fiscal year. First payment of the interests ($\$65,000,000 \times 6\% \times \frac{1}{2} = \$1,950,000$) is disbursed in September. The variance reflects the other amount of bond proceeds that should be paid in the fiscal year.

Cash Flows from Investing

The estimation of cash flow provides a pool for investment of available excess cash. The excess cash can be placed in a sweep account that earns interest on a daily basis but has no other use for the funds. On the other hand, a more active investment would involve investments in securities with specific maturities, to smooth out cash flows. Beyond the special limits placed by federal, state, and local laws, managers operate investment within the constraints of sound financial management, including no default risk, no credit market risk, and no illiquid assets. The water service department made an investment of \$1,500,000 at 3% rate and earns interest of \$3750 a month.

Net Monthly Cash Change

Once the anticipated cash flows have been determined for the fiscal year, net monthly cash change is calculated by adding total monthly cash flow balance and interest on excess cash to the beginning cash balance and subtracting interest on short-term borrowing. In September, the department's beginning cash balance is \$958,815 and interest on the balance is \$959. The department has negative total cash flow balance ($-\$861,870$). Thus, net cash change is \$97,904 ($\$958,815 + \$959 - \$861,870 = \$97,904$) for the month.

New Financing Needs

The cash budget indicates whether short-term financing will be necessary, in what month, and in what amount. Most organizations set minimum cash balance and will borrow funds to maintain that balance if necessary. Repayment of borrowing is also possible in any month with anticipated excess cash. When there

needs a financing, the minimum cash balance is the ending cash balance for the month. Otherwise, ending cash balance is calculated by subtracting the amount of repayment from the net monthly cash change. Finally, the cumulative amount of borrowing is tracked on the last line.

In the example, the department's net cash change in September is \$97,904, which is less than the minimum balance of \$100,000. It indicates that the department needs to borrow the difference ($\$100,000 - \$97,904 = \$2096$). Ending cash balance for the month is \$100,000, and the amount of cumulative borrowing is \$2096.

FINE-TUNING CASH FLOW FORECASTS

Structural components of the cash flow forecast will influence its accuracy. For example, forecasts with longer horizons will generally be less accurate than budgets with shorter horizons. Secondly, when forecasts are made more frequently, they have the advantage of incorporating more recent information. The forecast period will also influence the accuracy of the cash flow budget, with quarterly budgets being more accurate than daily budgets. On a daily basis, it may be difficult to determine if a payment or receipt will be made that day, but, on a monthly basis, there is a greater confidence that a specific payment will be made within a given month. Additionally, if a single payment or receipt should fall outside of the expected payment period, it will have less impact in a monthly forecast than in a daily forecast. However, there exists a trade-off between usefulness and accuracy.

Because of the substantial variation in balances during a quarter, quarterly budgets offer less aid to managers attempting to maximize the use of excess cash and minimizing the use of credit. From a cash management perspective, a monthly, weekly, or even daily cash budget provides better information for maximizing invested cash and minimizing borrowing than a longer forecast period. The length of the forecast period is a function of the needs of the government and the cost of producing the forecast. A daily forecast period requires more resources and may not be appropriate for a small government that has minimal cash to invest. Instead, a smaller government may opt for the less resource-intensive monthly forecast period. On the other hand, a government with daily balances of hundreds of millions of dollars would likely find that a daily forecasting system is necessary to optimize their cash investments. In designing a cash forecasting system, the size of the government is a critical factor in determining forecast needs; however, the size of the government will also influence the resources available to generate a cash flow forecast.^[8] However, it is safe

to say that regardless of size, all well-run governments generate a cash flow forecast of some form.

Cash Management for State and Local Governments

Dwight V. Denison

*Robert F. Wagner Graduate School of Public Service, New York University,
New York, New York, U.S.A.*

INTRODUCTION

Cash is the lifeblood of a public organization. Without cash, it becomes difficult, if not impossible, to provide goods and services. Governments without adequate cash cannot buy garbage trucks, maintain bridges, pay teachers' salaries, or operate social programs. On the other hand, cash not actively employed in providing government services should be prudently invested and earning interest revenues.

The day-to-day operations of governments generate and consume cash. Cash receipts arise from tax, fee, grant, and interest collections. Cash disbursements occur with vendor payments, employee salaries, finance charges, and capital expenditures. Cash must be obtained through borrowing during a cash deficit. Excess cash balances provide the opportunity for investment revenue. Comprehensive cash management is comprised of four primary components: cash forecasting, cash mobilization, investment, and bank relations. Each component is vital in fostering good fiscal health.

CASH FORECASTING

Cash management insures that cash inflows are adequate to meet cash outflows. To do so requires an ability to forecast the arrival and amount of cash receipts and disbursements. The timing of cash receipts is classified as certain, forecastable, or unpredictable cash flows. Certain flows are known in advance of when they occur. Examples of certain cash expenditures include contract salaries and interest payments. Forecastable cash flows can be estimated with reasonable accuracy using statistical methods and professional judgment. Examples of forecastable cash flow include sales tax collections and pension fund disbursements. Unpredictable cash flows arise from unanticipated events such as a lawsuit settlement or severe weather damage.

Governments usually forecast the operating cash deficit or surplus on at least a monthly basis through a cash budget. The cash budget tracks cash receipts and disbursements while taking into account the collection cycle of receivables and payment schedules. Monthly cash budgets help to identify financing needs

and to determine investment strategies. Daily cash balances can be monitored on a daily basis to determine opportunities for investing idle cash balances. Adams and Harrison^[1] discuss common techniques for forecasting cash balances.

CASH MOBILIZATION

Cash mobilization is the process of maximizing cash balances by decreasing the time it takes to collect cash owed to the government and by deferring disbursements. Unless efforts are made to mobilize cash, cash balances may be insufficient to meet disbursements. Furthermore, aggressive cash mobilization potentially increases the idle cash balances available for investment.

The first aspect in cash mobilization is to monitor the accounts and taxes receivable to the government. An aging schedule can be used to track delinquent tax payments and help determine appropriate collection efforts. Governments usually promote timely tax payments by imposing charges on delinquent accounts. In cases of non-payment, liens are frequently imposed. As an additional incentive, some governments offer a discount if the payment is received prior to the due date. Governments should regularly monitor the billing and collection processes to find ways to promote timely payments and reduce delinquency.

Larger governments often take steps to reduce collection float. Collection float is the time it takes for the funds to become available in government bank accounts once the payment has been submitted. Collection float is the total time it takes to transmit the payment from the payer to the government (transmission or mail float), plus the time it takes for the government to process the payment (process float), plus the time it takes for the payment to clear in the bank account (clearing float). To illustrate, consider that a citizen remits a property tax payment on June 1. It takes 2 days by mail to reach the revenue department and 1 day for the revenue department to process and deposit the check. Then, the check takes 1 day to clear before the funds become available for the government to spend. The collection float in this case is 4 days. Every day of collection float represents lost interest revenue to the government, for if the cash were available, it could be invested.

While it is impractical to expect that collection float could be completely eliminated, there are several techniques that governments employ to reduce collection float. Payment of taxes is primarily done via check, but some governments have implemented electronic transfers directly from one bank account to another through the Automated Clearing House (ACH). Electronic transfers between accounts reduce the mail and clearing floats. In the prior example, electronic transfer would reduce the collection mail float by at least 3 days. ACH transfers are recommended for transferring large payments between governments and are also convenient for smaller reoccurring payments.^[2]

Lockbox services are provided by banks to expedite the deposit of remitted checks, and if strategically located geographically, will also reduce mail float. In a basic lockbox service, the bank empties a P.O. box, deposits checks to the appropriate account, and forwards the documentation to the government. Many state and local governments significantly reduce collection float through the use of lockboxes.

The second aspect of cash mobilization requires that governments pay current obligations without incurring unintended fees or charges. Generally, obligations are not prepaid unless there are compensating incentives or discounts; otherwise, the cash could remain invested and generating interest. Vendors usually impose late charges if a payment is not received by the due date. Governments should avoid paying late charges unnecessarily but may consider late payment as an alternative to borrowing to meet a temporary cash deficit.

Governments may utilize float to detain cash outflows and increase idle cash balances. Disbursement float is the collection float in reverse. Governments can increase disbursement float by increasing mail float or clearing float. For example, there are generally 2 to 3 days of disbursement float on employees' wage checks before the balance posts to the government's bank account. In practice, excessive actions to extend disbursement float may result in late payments and jeopardize relationships with suppliers. Actions to extend clearing float, such as remote disbursement, are opposed by the Federal Reserve System.

Electronic transfers (ACH) have several benefits for disbursements. Electronic transfers are immediate, meaning the cash can be held until just prior to the due date. Electronic transfers can reduce paperwork and administration and therefore may be more cost effective than printed check disbursements. Moreover, supplier relationships are enhanced, because ACH transfers reduce their collection float.^[2]

The third aspect of cash mobilization is concentrating cash into pools that make it easier to invest. Banks offer a number of services for concentrating cash into pools that preserve the legal restrictions for accounting on the separate funds. Two common

services are the sweep account and the zero balance account. In a sweep account, the bank transfers the balance at the end of the day from each individual account to a central account, where the money can be invested overnight. The next morning, the appropriate balance is returned to the originating account. The zero balance account operates on the reverse principle. Individual account balances are zero, with the combined balances being held in a central account. Once a draft is presented to an individual account, the draft is honored, and the appropriate amount is transferred from the central account to bring the account balance back to zero.

Cash pooling makes forecasting daily cash needs easier, because pooled cash flows become less volatile and are more predictable than the cash flows of each component fund. As a result, concentrating cash balances also benefits investment aspects of cash management.

INVESTMENT

Cash not actively employed in providing government services should be invested and earning interest revenues. Investment revenues are increasingly important to governments with restricted tax revenues. Because higher rates of return are generally compensation for assuming greater risk in the portfolio, the public has been increasingly concerned about the regulation of government investment practices. Public concern in the oversight of government investment practices is warranted, because loss of tax dollars, potential default on debt, or even bankruptcy, can result from irresponsible investment.

The basic investment objectives considered when investing idle cash balances include liquidity, security, and return. Liquidity refers to the ability to transform the investment into cash. Liquidity is an important priority when investments may need to be converted to cash to meet unanticipated cash disbursements. Security refers to the credit and market risk associated with the investment. All investments carry some degree of risk, but certain classifications of investments are more vulnerable to loss. For example, securities issued by the U.S. Treasury have a low risk of default and are therefore called "risk-free," while non-investment-grade corporate bonds have a much higher probability of default. The return or yield from investments is the interest revenue that provides additional cash into government coffers. Investment returns may include direct interest payments or gains that result from securities purchased at a discount. Investment returns also include inflows of dividend payments and capital gains from mutual funds and stocks.

The investment objectives of liquidity, security, and yield typically conflict. In general, investment alternatives with higher risk generate higher yields. Under normal market conditions, higher yields are also associated with investments of longer maturity, as illustrated in the typical yield curve. Thus, aggressive maximization of yields often requires the sacrifice of security and liquidity.

Governments should establish investment goals through a written investment policy.^[3] Each government prioritizes the basic investment objectives based on cash flow characteristics, organizational goals, and various external factors, including legal, regulatory, and economic environments. Money market securities vary with respect to liquidity, security, and yields, and therefore, the securities held in a portfolio are screened to ensure compliance with the investment policy and to make sure investment objectives are met. A listing and description of common money market securities is presented in [Table 1](#).

Permissible Assets

Security of principal is crucial for government organizations, because investment default results in the loss of public funds and invokes political and fiscal repercussions. Consequently, all states constrain to some degree the investment of idle cash to permissible investment assets that meet a minimum standard of security. In a recent survey, all but five of the states reported administrative statutes influencing the permissible assets in which the state treasurer could invest public funds. Furthermore, 14 of the states also had constitutional restrictions in addition to state statutes regulating permissible assets.^[4]

Municipalities are also subject to legal restrictions when investing idle cash. Based on a survey of cities with over 200,000 in population, state statutes are the source of restrictions in 76% of the responding cities, and 6% of the municipalities are subject to state constitutional restrictions on permissible assets. In addition, municipal law dictates permissible assets for 41% of the surveyed cities.^[5]

It is important to emphasize that the basic investment objectives of liquidity, security, and yield are constrained by permissible assets. As presented in [Table 1](#), 94% or more of the states permit the purchase of repurchase agreements and U.S. Treasury and agency obligations. Other investments commonly allowed are certificates of deposits issued by state banks and commercial paper. Repos, U.S. Treasury and agency obligations, and CDs comprise the core of permissible assets. Other assets like banker's acceptances and commercial paper are now more permissible than 15 years ago.^[6]

Arbitrage

Investment of tax-exempt bond proceeds is regulated by the Internal Revenue Service (IRS). The IRS is concerned most with arbitrage of tax-exempt bond issues. In this context, arbitrage occurs when proceeds of tax-exempt bond issues are invested to generate investment revenue from securities bearing higher taxable yields. The difference between the investment revenue and the interest payment on the bond is a cash subsidy that comes at the expense of the federal government. The rules defining arbitrage can be tedious, but generally, arbitrage is not a concern if the proceeds are used in a timely manner to construct buildings or purchase other capital assets.^[7] Minor arbitrage infractions require cash payments to the IRS equal to the subsidy. Egregious arbitrage threatens the tax-exempt status of the bond issue.

Investment Strategy

The investment objectives of security, liquidity, and yield are accomplished through the investment strategy. The investment strategy employed by the portfolio management may vary among the different types of cash balances. The nature of the idle cash balances invested by state governments can be classified into three types: temporary surplus, long-term surplus, and pooled surplus. A temporary surplus results from the lag between revenue collections and expenditure disbursements in the general, special-revenue, capital, and enterprise funds. A temporary cash surplus will be expended within the year, and therefore, liquidity is crucial. Long-term cash balances held by the state for a year or longer are often associated with the trust, pension, or debt service funds. A long-term investment horizon provides more flexibility in the investment strategy to increase yields without compromising security. Pooled surplus results from the pooling of cash balances from separate funds or even multiple governments. The characteristics of pooled surpluses are different in nature than the comprising temporary or long-term funds, because pooling can increase the stability and predictability of the cash flows.

Cash-flow characteristics also have a great deal of influence on the strategies utilized in managing the investment of idle cash balances. Government funds with more certain cash flows may be managed more aggressively to enhance yield without unduly compromising liquidity and security. On the other hand, funds with unpredictable cash flows require a more liquid strategy to ensure the availability of funds on demand.

Investment strategies may also be influenced by the expertise of the state's investment staff and the ability to consolidate cash balances and manage risk.

Table 1 Description and permissibility of select money market securities

Security	Description	Percent of states where permissible
Bankers acceptances (BA)	BA is a negotiable draft payable at a specified future date where a bank guarantees payment at maturity. BAs are used to make payment easier in the movement of goods, particularly international trade. The credit risk of a BA depends on the accepting bank. BAs are highly liquid and are bought and sold at a discount from par. (\$25,000–\$1,000,000 denomination)	78%
Commercial paper (CP)	CPs are unsecured short-term obligations (1 to 270 days) of a corporation usually sold at a discount from the par value. There is a strong secondary market, and the credit risk depends on the creditworthiness of the issuing corporation. (usually \$100,000 denomination)	90%
State investment pools	This is a money market fund operated by a state government for municipal and county investors. Pools provide good liquidity and diversification at substantially lower minimum investment requirements.	60%
Negotiable and non-negotiable certificates of deposit (CD)	Financial institutions issue certificates of deposit for maturities generally up to 1 year but may have maturities up to 5 years. The liquid (negotiable) aspects of the CD depend on the reputation of the issuing bank. Negotiable CDs are normally denominated in \$100,000 per round lot with interest paid semiannually or at maturity. Non-negotiable CDs can be purchased at much lower denominations, but there is no secondary market. Some states also require that CDs be obtained from banks within the state.	In state 88%; National 48%
Repurchase agreements (repo)	Repos are a collateralized transaction, where a securities dealer agrees to sell securities (usually U.S. Treasury or agency obligations) to the investor and then repurchase the securities at a predetermined price on some future date. The investor receives a fixed rate of interest as compensation for the exchange. Repos require \$100,000 to \$1 million to initiate and are negotiated between dealer and investor and are therefore difficult to sell on a secondary market. However, the maturities are overnight to 90 days and, therefore, are highly liquid. The risk of repos depends on the counter party and the market value of the collateral.	98%
U.S. treasury bills, notes, and bonds	These are highly liquid securities that are direct obligations of the U.S. Government, and therefore, are considered credit risk-free. T-bills have short maturities and are purchased at a discount. Notes and bonds are longer-term securities that generally pay semiannual interest and are vulnerable to market risk if sold before maturity.	96%
U.S. agency bonds	These are low-risk securities issued by U.S. Agency corporations (Fannie Mae, Freddie Mac, Sallie Mae, Ginnie Mae). They are issued in denominations of \$1000 and \$5000 with maturities usually more than a year, and therefore, they are vulnerable to market risk.	94%
State/local government obligations	State and local governments issue general obligation securities that are backed by the full faith and credit of the government and therefore have a low risk of default. Securities can be short-term notes or bonds with longer maturities. Revenues bonds have more credit risk, as the underlying collateral is a pledged revenue source. Interest on these securities is generally exempt from federal income tax and may be exempt from the state income tax.	70%

(Continued)

Table 1 Description and permissibility of select money market securities (*Continued*)

Security	Description	Percent of states where permissible
Corporate notes/bonds	These offer fixed income security that obligates the corporation to make scheduled payments to the bondholder. They vary in maturity and denomination and are vulnerable to credit and market risks.	68%
Corporate stocks	These are an equity instrument that constitutes an ownership share in a corporation and therefore may exhibit high financial risk. Stock share prices fluctuate widely with the market. There exists a strong secondary market for the stock of many publicly traded firms, but they are considered too risky by most organizations for short-term investment.	Domestic 32%; Foreign 22%
Derivatives	Derivatives are financial securities, where the market value depends on an underlying market indicator. For example, STRIPS are the principal portion of Treasury Bonds sold at a deep discount (zero coupon bond) that are extremely vulnerable to market risk.	14%

Permissibility percentages are calculated from NAST.^[14,15]

Investment strategies are generally classified as active or passive, depending on assumptions about market efficiency. An efficient market is one in which a security's price reflects all public information. This is important, because in an efficient market, it would be futile to devote time searching for underpriced bargains or avoiding overpriced lemons. A passive investment strategy assumes market efficiency. Therefore, there is no effort to play the market in order to enhance returns. The goal of a passive investment strategy is to maximize coupon income through a buy and hold approach. On the other hand, an active investment strategy assumes the portfolio can outperform the market by searching for undervalued securities and incorporating expectations about future market conditions. For example, a portfolio manager may purchase a 5-year treasury note with the expectation that interest rates are declining, and the note can be sold in 30 days at a capital gain. For more on investment strategies, see Ramsey and Hackbart.^[8]

Prudent Person

Many states and municipalities are implementing a prudent person rule. The prudent person rule emphasizes preservation of capital and discourages speculative transactions by requiring that the government's funds be invested with the same discretion and care that a reasonably well-informed person would use to manage their own affairs.^[9] The advantage of the prudent person rule is that the portfolio manager is held legally accountable for speculative investing, without the governing board being overly concerned that the investment policy may not delineate the permissibility of every new financial market innovation or

derivative. Still, the prudent person rule does not excuse a legislative body or governing board of its oversight responsibilities.

Local Government Investment Pools

Local government investment pools are increasingly popular for investing idle cash from state and local governments. Investment pools generally operate as a mutual fund, with investors purchasing a share of the portfolio. Total portfolio returns are distributed to the investors proportional to the number of shares. The advantage of investment pools is that the governments can obtain greater diversification at lower investment minimums. There are 30 local government investment funds operated through states for a combined portfolio worth more than \$143 billion, with more than 16,000 participating governments nationwide.^[10]

Outsourcing

Governments are increasingly outsourcing investment functions; nearly 65% of the cities responding to a 1999 survey utilized an external investment manager or consultant. While municipalities can delegate investment selection, the municipality remains responsible for the safety and liquidity of governmental funds. This does not mean, however, that the investment advisor does not have due diligence in adherence to investment policies and acting prudently. The Government Finance Officers Association (GFOA) has produced guidelines on the contracting of services that underscore the issues of investment priorities and permissible assets.^[11]

Table 2 Types of cash management services offered through banks

<i>Collection services</i>	<i>Disbursement services</i>
• Electronic (ACH) collections • Wire transfers • Preauthorized checks • Lockbox services • Armored car services • Night deposit • Coin counting services	• Electronic (ACH) payments • Wire transfers • Concentration and zero-balance accounts • Controlled disbursement accounts • Account reconciliation • Check imaging and digital archiving
<i>Credit services</i>	<i>Investment services</i>
• Revolving line of credit • Letter of credit • Short-term notes • Leasing • Community and economic development lending	• Certificates of deposit • Money market instruments • Custodial arrangements for repurchase agreements • Overnight sweep accounts

BANK RELATIONS

Bank relationships are vital to effective cash management. While banks provide core services like checking and savings accounts, banks are also expanding the range of cash management services available. Table 2 lists a range of services that banks provide to help the cash mobilization and investment efforts of governments. For an in-depth description of specific bank services, see Harrell^[12] and Redlin.^[13]

Banks do not provide services for free. Banks recoup the costs of these services through fees or compensating balances. The cost of compensating balances to a government is the foregone interest revenue. The decision to utilize banking services should consider the costs and benefits of the arrangement, keeping in mind that the charges for specific services often vary from bank to bank. As with any outsourcing, contracts should detail the services provided and specify fees and other compensation.

CONCLUSION

Cash is the lifeblood of a public organization, and cash management ensures the vitality of the organization. The four primary components of cash management are cash forecasting, cash mobilization, investment, and bank relations. Cash management must be adapted to meet the needs of a specific public organization. For some organizations, the fundamentals of cash management discussed here may be a sufficient foundation in forming effective cash management processes. Most, however, will need to explore the cash

management components in more detail through the references and additional study. As long as governments continue to bolster non-tax revenues and feel the pressure to improve fiscal efficiency, cash management will play a vital role in public administration.

Chinese Public Administration: History and Current Trends

Yijia Jing

Department of Public Administration, Fudan University, Shanghai, P.R. China

INTRODUCTION

Chinese public administration (PA) has been undergoing a significant transformation since late 1970s. Despite its kaleidoscopic developments, the major underlying impetuses are twofold: the historical heritage and the modernization momentum. This chapter lays out a miniature of Chinese PA by a brief review of the administrative history of China and a generalization of the recent tendencies in Chinese PA. The analysis makes it explicit that Chinese PA is experiencing a rapid paradigm-shifting process toward modernization.

A BIRD'S-EYE VIEW OF CHINESE ADMINISTRATIVE HISTORY

China has a very long administrative history, spanning thousands of years. According to the nature of administration and its relation to politics, such a history has three major stages of development.

Royal Administration (pre-1912 Period)

Kingly administrative history of China began in Xia Dynasty in the 22nd century B.C. In 221 B.C., *Qinshihuang* united China and established a centralized and complex administrative system. Until the end of Qing Dynasty (1644–1912), subsequent feudal empires created glorious ancient civilization. The ancient royal administration of China was characterized by several features. First, it had a highly centralized structure of power. The emperor was an absolute ruler with legislative, executive, judicial, and spiritual powers. Local officials were appointed by the emperor. Second, a formal examination system, *Kejuzhi*, was created since Sui Dynasty (581–618) and became a major channel for the government to recruit talented and educated literati, some of whom were from the lower class. Orthodoxy education and examination were strictly based on Confucianism and its later ramifications. Third, morality was deemed as essential for good governance. Officials were evaluated regarding their loyalty to the emperor, their understanding of the Confucian philosophy, and their dedication to the popular well-being. Fourth, despite the generalist trend

and the focus on moral tenets, sophisticated administrative institutions and a delicate system of division of labor were developed to administer the society. Ancient bureaucrats were specialists called *li*, different to *guan*, officials who were selected through state examinations, assigned political leadership, and hardly equipped with administrative competence. *Li* were the standing forces of the bureaus and possessed professional skills, capabilities, and institutional knowledge.^[1]

As Wilson argues that “the desire to keep government a monopoly made the monopolists interested in discovering the least irritating means of governing,” the carefully designed Chinese ancient administrative systems performed well in many aspects such as finance, public works, and relief.^[2] Without steam engine and telegraph, it could govern a population over 200 million since the late 18th century.^[3] Yet, the highly personal system lacked a built-in mechanism to sustain development and prevent social inequality, corruption, and tyranny. The ancient Chinese history roughly exhibited a 200-year cycle of new dynasty, prosperity, decline, peasant war, and new dynasty.

State Administration (1912–1978 Period)

The Qing Dynasty was ended by Republic of China (ROC, 1912–1949) in 1912 through violent revolution. ROC was replaced by People's Republic of China (PRC, 1949–) in 1949 in the same way. Between 1912 and 1978, it was a period of modern state building and nation building. Administration mainly served the authoritative state, with a Leninist party as an instrument of political struggle.

1912–1949 period

The early stage of ROC was a period of warlord battles and disintegration. The Kuomintang Party (KMT) founded the Nationalist regime in Canton in 1925 and established the State Council as the highest executive branch. It was a highly integrated party–state system and was maintained after 1928, when KMT reunited China. In 1929, the *Five-Yuan System*, including the *Executive Yuan*, the *Judicial Yuan*, the *Legislative Yuan*, the *Examination Yuan*, and the *Control Yuan*, was established according to Sun Yat-Sen's *Five-Power* theory. Although this system was designed

under the idea of the check and balance of powers, it was finally subject to the control of Central Political Committee of KMT.^[4] Due to the Japanese invasion (1931–1945), the two civil wars (1927–1937 and 1945–1949) between the KMT and the Chinese Communist Party (CCP), and the actual warlord control over many provinces, the administration of ROC mainly served wars, although it unsuccessfully endeavored to introduce many modern institutions, for example the Comptroller-General Office with independent authority of budgeting.^[4]

1949–1978 period

National security and social transformation were CCP's two primary missions during the first three decades of PRC. Imitating the USSR socialist regime, the society was organized as a "state syndicate," which substituted the market by centrally made plans and directions in distributing and redistributing resources. First, administrative power was vertically concentrated to the central government and horizontally concentrated to party leaders. The party had a similar organizational structure to that of the government and held the decision-making power. Second, state-owned enterprises (SOEs) almost monopolized industry and commerce. Fast capital accumulation of heavy industry was pursued by using the *Residence Registration System* to limit migration of peasants to urban areas and by enforcing significant price differences between agricultural and industrial products. Third, the government was omnipotent and penetrated almost all social spheres. Due to the high level of integration between the party, the state, the economy, and the society, the expansion of PA system lacked basic institutional constraints. A vicious cycle of administrative "streamlining–swelling–streamlining again–swelling again" emerged.^[5] The administrative system was driven by communist ideology and focused on class struggle, which culminated during the cultural revolution (1966–1976). Despite the dual emphasis on "red and professional," morality mandate, namely the loyalty to the party and its ideals, was the overwhelming criterion in recruiting and evaluating a cadre.

Public Administration (post-1978 Period)

After the third Plenary of the 11th CCP's National Conference in 1978, CCP recognized peace and development as the world's dominant themes and adopted the reform and open policy. China's administrative system gradually incorporated modern values of PA and exposed itself to popular control. China's PA system experienced a major transformation, as will be analyzed in the following.

CURRENT TRENDS IN CHINESE PA

Reidentification of Role and Missions

Pre-1978 regime was extremely syncretized and deprived the society of its capacity of homeostasis. In the post-1978 era, Chinese PA has been substantially relocated and rationalized by functional differentiation. First, economic development and market reform became PA's major tasks. The government gradually separated itself from economic operation through deregulation and privatization. Plans and direct intervention into the economy were largely reduced. SOEs were either sold or incorporated. From 1978 till 2004, the share of SOEs and state-holding companies in national industrial output decreased from 77% to 35%.^[6] China has been actively seeking the acknowledgement of its market economy status in international community. Second, the government has retreated successfully from many social spheres and shed its functions. The rural communes collapsed and the urban working unit system quit their social services.^[7] Grassroots governance was, to some extent, shifted to self-government organizations, including *Villagers' Committee* and *Urban Residents' Committee*. Third, not so significantly, there was a trend to separate the party from the government (*dang zheng fen kai*). Reformers in 1980s attempted to limit the party role to political leadership and enlarge the authority of professional administrators in personnel management. Yet, since 1989, the official ideology regressed and such efforts were reversed.^[8] Fourth, intergovernmental relations were streamlined. Jurisdictions of central and local governments were adjusted, according to economic and administrative principles. Decentralization was a major trend since 1980s.

Adjustment of Administrative Values

Post-1978 Chinese PA, to some extent, internalized modern administrative values that reshaped its behavior and dynamics.

Democratic values

Democratization of China's PA system has two aspects. First, the legislature, People's Congress, has strengthened its legislative and supervisory functions in recent years and imposed on governments increasing burden of legal and managerial accountability. Second, democratic values such as transparency and participation were incorporated. While a *Government Information Act* is not available yet, citizen's right to know has been taken care of incrementally, for example by requiring governments at and beyond county level to have websites and publish specified information regularly. In 2003, the Head

of Ministry of Health and the Mayor of Beijing were deposed partly due to their failure to disclose the information of the infection of SARS to the public. Policy making was made more accessible. Without having binding decisions, public hearings, including administrative penalty hearing, price hearing, and legislation hearing, were initiated since late 1990s.^[9] Public opinion is increasingly taken into decision-making process.

Legal values

Traditional Chinese PA was not a system of rule of law, but of man. The post-1978 period highlighted a gradual adaptation to modern legal standards. First, protection of individual rights improved. The 24th Constitutional Amendment passed in 2004 added to the 33rd Article that “the state respects and protects human rights.” Besides the constitutional enhancement, the practice of PA also demonstrated a “credible commitment” of property rights protection.^[10] Second, administrative laws prospered and shifted the focus from administrative empowerment to equal rights protection. In 1990, the *Administrative Litigation Law* was enacted, which ensured the equal status of non-governmental actors in suing against administrative agencies. Third, procedural due process was strengthened. Besides procedural laws in special administrative areas, for example 1996 *Administrative Penalty Law* and 2004 *Administrative Permission Law*, a comprehensive *Administrative Procedure Law* has been under official consideration for almost two decades. Like its U.S. counterpart, the 1946 *Administrative Procedure Act*, this proposed law introduces legal procedures and promotes values such as transparency, accountability, participation, and limitation on intrusiveness. Yet, law enforcement was seriously hindered by two facts. First, despite the legal authorities of People’s Congress in creating, budgeting, and reviewing administrative agencies, the government is de facto accountable to the party. Second, the judicial system was also non-independent. The 2006 *Corruption Perception Index* ranked China as the 70th in its level of incorruption among the 163 countries and regions, identical to that of India, Brazil, and Mexico.^[11]

Managerial values

Performance was emphasized to serve pragmatic goals of economic development. Since 1980s, PA was professionalized and rationalized, to some extent, following the Weberian ideal-type bureaucracy. Recruitment, training, and career track were normalized. Position responsibility system was introduced. In 1988, the Ministry of Personnel was founded. In 1989, State Civil Servant Examination began to replace the old labor allocation system in staffing non-leading positions. In 1993, the *Provisional Regulations for State Civil*

Servants were promulgated, replacing the cadre system with a civil service. In 1994, State Administrative School was founded for administrative research and education. Yet, neutral competence, the core of civil service, was not established. Further, while civil servants in general got younger, better educated, and better trained, there was a biased favor of economic technocrats, with a background of engineering, SOE management, or economic planning.^[5] In late 1990s, “reinventing government” bandwagon got popular in China. Among the two themes of New Public Management, managerialism achieved little in China, while public choice, in the form of privatization, gained enormous success.^[12]

Administrative Empowerment

Besides functional differentiation and value adjustment, organizational restructuring was taken to rejuvenate the administrative system and enhance administrative capacity.

Adjustment of the central–local relation

The central government has taken all efforts to motivate, coordinate, and control the local governments. Despite a general trend of decentralization, central government managed to strengthen itself. In early 1980s, central and local governments redelineated their scope of authority. “The subnational governments have primary authority over the economy within their jurisdictions,” while “the national government has the authority to police the common market and to ensure the mobility of goods and factors across subgovernment jurisdictions.”^[13] A parallel decentralized fiscal system, plus the lack of taxation capacity, led to a weak state and a weak central government in collecting and distributing economic resources.^[14] Local state corporatism, as well as localism, rose in China due to the direct link between local economic growth, local fiscal revenues, and cadres’ evaluation and compensation.^[15] As a response, in 1994, the central government introduced the tax-assignment system to “replace the old, discretion-based system of revenue-sharing with a new rule-based system of revenue-sharing.”^[16] The proportion of budgetary revenues in national GDP rose continuously from the lowest point of 10.7% in 1995 to 19.3% in 2004. By spending 27.7% of fiscal expenditures but collecting 54.9% of the fiscal revenues in 2004, the central government obtained the upper hand in influencing local decision making.^[6] Compatible with the transfer of responsibilities to localities, “two-level-down management” replaced “one-level-down management” in personnel appointment after 1984. Local officials were delegated full authority in appointing their direct subordinates.^[17]

Reinventing government

The efforts of Chinese PA to actively reshape and adapt to the government–business and state–society relations can be covered under the “reinventing government” umbrella. Since early 1980s, many governmental functions were decentralized, shed, or transformed to serve the market reforms. Administrative directions and plans gave way to legal and economic means. Governments were expected to be rule makers, adjudicators, and public goods suppliers, rather than direct market participants. Administrative agencies were reorganized, according to the general idea to incorporate their productive functions and maintain their regulatory functions. Industrial ministries or bureaus such as the Electronic Industry Ministry or Coal Ministry were either revoked or demoted. Accordingly, there was enlarging boundary blurring in providing public services. Increasing fiscal revenues, loss of direct operational capacity, growing market and society, and the agreed-upon role of the government in promoting domestic demands created a significant incentive of governments in co-opting external resources by economic means. Public–private partnership developed quickly, and a simple estimation shows that from 2001 to 2004, the aggregate level of outsourcing was between 20% and 30%.^[18] Major outsourcing went to business organizations, creating a major source of corruption. In 2006, China launched a special campaign to strike business bribes. Non-profit organizations are getting more important in providing social and human services. These organizations are often small and affiliated to governments. Another important aspect is the adjustment of the means and scope of government’s social intervention. After the collapse of the rural commune system and the decline of urban working unit system, the omnipresent state penetration declined. Mass mobilization and movement were no longer useful in motivating and monitoring local officials. State retreat and the weak civil society created the vacuum or aperture of governance. Spontaneous grassroots mass organizations, such as *Villagers’ Committee*, were officially recognized, promoted, led, and financed by the government. Non-governmental organizations, such as Homeowner’s Association, developed very fast, and their collective private governance received favorable treatments from the government. Corporate social responsibility was also promoted by the government.

CONCLUSIONS

This article reviews the royal, state and public administration stages of Chinese administrative history, which essentially corresponded to China’s political development.

Functional differentiation, value adjustment, and organizational restructuring were major drives that placed Chinese PA on an irreversible track of modernization since late 20th century. Due to many unique factors, such as the huge size of the population and the special historical path, such a modernization process has to be long and full of Chinese characteristics.

Citizen Participation in Local Government

Anthony J. Nownes

Department of Political Science, University of Tennessee, Knoxville, Tennessee, U.S.A.

INTRODUCTION

Over the years, scholars have devoted considerable attention to the topic of citizen participation in local government and politics. In this brief article, I will summarize what these scholars have learned about this important topic. I will begin with a cautionary note on the inherent difficulty of understanding citizen participation in local government. From here, I will examine the most well-known form of citizen participation in local politics—voting. Next, I will discuss the linkage institutions through which citizens participate in local politics—political parties and interest groups. Penultimately, I will examine citizen contacting. Finally, I will say a few words about other forms of citizen participation in local government and politics.

UNDERSTANDING CITIZEN PARTICIPATION IN LOCAL GOVERNMENT

Arriving at a comprehensive understanding of citizen participation in local government is tricky at best. First, there is the problem of variety. In the United States, there are many types of local governments, including authorities, cities, counties, villages, municipalities, districts, towns and townships, and metropolitan governments. Because these types of governments differ from one another, learning about citizen participation in one may tell us little about citizen participation in any of the others. The problem of variety is compounded by the fact that *within* specific types of local government, there is also considerable variety. For example, city governments generally come in three types—mayor-council, commission, and council-manager. Because different institutional arrangements make for different opportunities and incentives for citizen participation, this variety makes it difficult fully to comprehend and understand citizen participation in local government.

The task of understanding citizen participation in local government is made all the more difficult by the fact that citizen participation is itself a multifarious phenomenon. There are literally dozens of forms of political participation, including voting, working on political campaigns, contributing money to candidates for public office, contacting public officials, protesting

or demonstrating, joining political organizations, and informally discussing politics with others. A full understanding of citizen participation would require a full understanding of a large variety of forms of participation.

In short, if there is one thing we know about citizen participation in local government and politics, it is that we are far from a comprehensive understanding of the phenomenon. This lack of knowledge, as they say, “comes with the territory.” As scholars and students then, we cannot possibly hope fully to comprehend citizen participation in local government in its entirety. Instead, we simply must look to gain a broad understanding of the phenomenon—one that gives us a general idea of what is going on in the over 80,000 local governments in the United States.

VOTING, ELECTIONS, AND CAMPAIGNS

Voting is the most obvious form of political participation in the United States. Voting is also the simplest and most straightforward method by which citizens make their wishes, demands, and opinions known to government officials. The broad topic of voting can be broken into two specific subtopics: voter turnout and voter choice. In this section, I will discuss each briefly. I will also discuss direct democracy.

Voter Turnout (Who Votes?)

The question of who votes in local elections invites an obvious answer: *hardly anybody*. Although turnout rates vary widely, turnout in local elections is typically below 30%. Turnout levels of below 20% are not unusual. There are many reasons for low voter turnout in local elections. Three reasons in particular stand out. First, large majorities of citizens simply are not interested in local politics. Apparently, issues such as zoning and solid waste disposal are not of interest to many voters (though they probably should be). Second, many local elections are non-partisan. Overall, approximately two-thirds of all local elections are nonpartisan, which means that candidates do not appear on the ballot with a party affiliation. Studies show that partisan election campaigns generate far more citizen interest than non-partisan campaigns.

Third, local elections are often held in “off years” or “off times”—that is, when no high-level government officials (for example, the president and the governor) are being chosen. This tends to depress interest and turnout in local elections. Research on who actually votes in local elections has produced very few surprises. As is the case in elections at the state and national levels, in local elections affluent and well-educated citizens tend to vote at much higher rates than not-so-affluent and not-so-well-educated citizens.

One topic that has received a great deal of research attention over the years is how local government structure affects voter turnout. The evidence is somewhat ambiguous, but four findings are widely accepted. First, cities with council-manager governments have lower levels of turnout than cities with mayor-council governments. Second, cities in which mayors and/or council members serve full time and have staff experience relatively high levels of turnout. Third, local governments that directly elect the executive have higher levels of turnout than those that do not. Finally, voter turnout tends to be higher in places with significant social (e.g., racial) cleavages.

Voter Choice (Who Wins?)

As for who wins local elections, a few patterns emerge. First, incumbents generally win. Like incumbents running for state and federal office, local incumbents tend to have higher name recognition than challengers and thus tend to attract more media attention and money than challengers. Second, in many places, race plays a substantial role in determining electoral outcomes. For example, there is evidence that voters, especially non-white voters, tend to support candidates of the same race. (There is also evidence, however, that overtly racial electoral campaigns are not particularly effective.) Third, in low-profile local elections (such as those for Clerk of Deeds or County Supervisor), name recognition is crucially important, so candidates with long histories of civic involvement and extensive contacts in the business world and local associations tend to fare best. Finally, the last 15–20 years or so have been extraordinarily fruitful for non-white candidates. For example, approximately one-third of all large cities (cities with more than 200,000 people) now have nonwhite mayors, and there are well over 3000 Hispanic or Latino local elected officials serving in the United States.

Direct Democracy

Before we leave the topic of voting, it is important to note that in many localities citizens have the right directly to make policy by voting on initiatives

and/or referenda. Generally, there are hundreds of local initiatives and referenda on the ballot every election year. There is some evidence that particularly controversial initiatives or referenda can draw relatively large numbers of voters to the polls. As for which side prevails in direct democratic elections, there is a great deal of controversy surrounding this question. On the one hand, some argue that “money talks” and the side that spends the most has a huge advantage. On the other hand, some scholars maintain that money is hardly ever the determining factor in a direct democratic election. For now, this remains an open question.

LINKAGE INSTITUTIONS

Of course, citizens who are interested in local government can do more than just vote. Another way they can participate in local politics is by becoming active in linkage institutions—political parties and interest groups.

Interest Groups

Many years ago, local government expert Paul Peterson wrote that local politics is largely “groupless.” He may well have been correct at the time. But today, groups are everywhere in local politics.

The dominance of business

Interest groups, which are broadly defined as organizations that seek to influence government decisions, are decidedly active in local politics. Research has shown that several types of organizations regularly and actively seek to affect the decisions of local governments of all kinds. First, there are business firms. Virtually all comprehensive treatments of local government decision-making note that business elites—the people who own and run business enterprises—are key players in local politics and often have close relationships with local government officials. Not surprisingly, some types of businesses are more active in local politics than others. For example, builders, construction companies, and real-estate developers are very active, primarily because much of what they do is regulated by local governments. Banks are also quite active. Second, there are business associations. Chambers of Commerce and junior Chambers of Commerce, for example, are active in localities of all shapes and sizes, and their leaders and activists often have a great deal of clout with government officials. Civic clubs such as the Rotary Club, the Lions Club, and Kiwanis, which consist largely of local businesspeople, are also quite active.

Non-Business organizations

Businesses and business organizations are not the only types of interest groups active in local politics. In recent years, neighborhood groups and “not in my backyard” (NIMBY) groups have become quite prolific and powerful in local politics. These groups are generally interested in quality-of-life issues surrounding zoning and planning and often form to oppose new projects that they think will decrease property values or increase traffic, pollution, noise, or crime. In some places, especially large cities, labor unions are also powerful interest group actors. Many local government employees, including police officers, fire fighters, and teachers, are union members, and their unions are often powerful actors in local politics. Municipal unions are most visible when budget time rolls around and their salaries and benefits are determined.

Finally, a variety of other types of organizations, including churches, local environmental groups, and the local affiliates of nationally active groups, are also active in local government when the issues they care about reach the local governmental agenda.

How much power do interest groups wield?

The fact that interest groups are active at the local level begs the following question: How influential are interest groups in local politics? The answer appears to be “very powerful.” Studies conducted in the 1940s, 1950s, and 1960s, for example, showed that business interests—individual business firms and business associations—were dominant players in many localities. In recent years, a more balanced view has won out, as scholars have shown that while business interests are almost always “at the table” when local government decisions are made, they are not all-powerful. Research conducted over the past two decades has shown, for example, that labor unions exert substantial influence over the taxing and spending policies of many local governments. Moreover, research on neighborhood groups and NIMBY groups has demonstrated that groups of citizens are often very influential players in local politics, especially land-use politics.

Political parties

There is not a great deal of research on political parties at the local level. This is the case primarily because large numbers of localities have non-partisan elections. Moreover, people who study political parties tend to focus on parties in national (and, to a lesser extent, state) politics. Nonetheless, political parties are important players in local politics. The high point of local

party strength came in the early 1900s, when literally hundreds of localities were ruled by political party “machines” that nominated candidates for office and virtually bribed voters to support them with tangible material incentives such as government jobs, enhanced services, and favors. By mid-century, most party machines had lost strength, and today the party machines of old are gone.

At the other end of the spectrum from party machines are local party organizations that do virtually nothing. Research shows that in many places local party organizations are either inactive or understaffed. This does not mean, however, that local party organizations are completely moribund. Today, perhaps as many as 50–60% of local party organizations are active, engaging in a large variety of activities including recruiting candidates, raising money, campaigning for candidates, contributing money to candidates, and conducting get-out-the-vote drives.

As for the influence of local party organizations, it is difficult to determine. But the extant research suggests a few conclusions. First, in many places local party organizations play a vital role in the recruitment of candidates for local, state, and even federal office. Second, in the last decade or so, local party organizations have become increasingly adept at fund-raising (as have state and national party organizations) and thus are invaluable to many candidates. Finally, even in localities with non-partisan elections, local party organizations play a crucial role in providing cues to voters and mobilizing citizens to vote.

CITIZEN CONTACTING

Citizen contacting—that is, the practice of citizens contacting acting government officials with either requests for services or complaints—is a common form of citizen participation in local government. Moreover, because most government services are provided by local governments rather than state governments or the national government, it has been studied extensively by scholars of local politics. The research on citizen contacting has produced several findings of note. First, levels of contacting are surprisingly high. In fact, in a typical year, far more citizens contact local government officials than vote. Second, homeowners and citizens with minor children engage in more contacting than renters and citizens without minor children. Apparently, people who own homes and/or have children tend to feel that they have a large stake in their communities. Third, citizens who pay attention to local politics engage in contacting much more than citizens who do not. Fourth, citizens with high levels of political efficacy engage in more contacting than citizens with low levels of efficacy. Fifth,

socioeconomic status is not strongly related to levels of contacting. In fact, there is some evidence that unlike most forms of political participation, contacting is done as much by citizens from relatively low socioeconomic strata as by citizens from relatively high socioeconomic strata. Sixth, citizens increasingly contact local government officials via the Internet, as more and more local governments stake out an on-line presence. Finally, citizens who engage in citizen contacting generally express relatively high levels of satisfaction with local government. In other words, they are generally pleased with the response they receive when they contact government officials.

OTHER FORMS OF PARTICIPATION

There are several other forms of citizen participation that I have not covered here. Perhaps the most common is participating in public hearings (which are common at the local level, especially on land-use matters). This form of participation can be effective, especially if citizen participation is extensive. Among less common forms of citizen participation are serving on local government boards and commissions, participating in surveys conducted by government officials, protesting and demonstrating, running for public office, campaigning for candidates, contributing money to candidates' campaigns, and attempting to influence appointment to public office.

CONCLUSION

There is still a lot we do not know about citizen participation in local government. In fact, it is fair to say that this topic is ripe for further research attention. Nonetheless, we do know a few things about citizen participation in local government and politics. First, participation in local government is neither common nor unusual. On the one hand, large majorities of citizens fail to turn out for local elections. On the other hand, large numbers of people engage in citizen contacting. Second, political parties and interest groups are important players in local politics. Although no one thoroughly has taken account of the power of parties and interest groups in local politics, it is safe to say that they are influential players in many places. Third, people can make a difference in local politics. The successes of both neighborhood and NIMBY groups in stopping controversial developments and the astounding increase in the number of non-white local elected officials attest to the power of citizen participation.

Citizen Participation in the Budget Process: Exit, Voice, and Loyalty

Carol Ebdon

*Department of Public Administration, University of Nebraska at Omaha,
Omaha, Nebraska, U.S.A.*

INTRODUCTION

Various methods enhance citizen participation in the budget process. Even though empirical evidence is sparse, participation appears to be beneficial when it educates citizens in the complexities and costs of government services, and may help to reduce distrust of government. There is still little evidence, partly due to methodological difficulties, that participation actually changes budget outcomes, although several cases and anecdotal stories support the notion that there is some effect.

In spite of the perceived benefits of participation, opportunities are still not prevalent. This is particularly true early in the budget process, when public opinion would conceivably have the greatest impact on decision making. To move beyond education to true two-way dialog regarding the budget is not easy, due to structural and cost barriers, difficulties in gaining input from numerous representative citizens, and conflicts in the roles and attitudes of both administrators and elected officials.

PARTICIPATION MECHANISMS

Researchers looking at general participation mechanisms have found that it is most beneficial when it occurs early in the process and when it is two-way deliberative communication, rather than simply one-way information sharing.^[1] In the case of the budget process, then, this requires more than the ubiquitous public hearing that is usually held at the end of the process, just before final adoption by the legislative body. Citizens also have a voice in direct voter referenda, which are often required for governments to increase taxes or to issue general obligation debt. Again, though, referenda usually occur at the end of the process, and voters may not be well informed about the potential consequences of their actions.

Citizen surveys can be used early in the budget process to determine service satisfaction levels, needs, and

priorities. For example, the city of Auburn, Alabama, used surveys prior to budget development; citizens reviewed a list of city services and were asked to which they would give the highest priority in the upcoming budget.^[2] Surveys can show officials citizen satisfaction levels, responses may represent views of the public at large, and if used consistently over time can show important trends in opinions. However, appropriate question design is important, and surveys may not reflect the intensity of a respondent's opinion.^[3] In addition, cost is a factor, and the responses may not be well thought out.^[4]

Public meetings may also be used to discuss budget issues during or prior to budget development. These forums provide citizens the opportunity to voice their opinions and can provide for two-way communication early in the process. However, attendance is often low and may not represent the community as a whole, and participants may have insufficient knowledge for effective input.^[3] Some communities use public meetings in an intensive way for a broad "community visioning" process to plan for the future or allow citizens to work through options related to major issues.^[5] A Minnesota school district superintendent used a public deliberation process to cut \$2.4 million from the budget after significant state aid reductions. The process lasted 4 months, beginning with recommendations from teachers, administrators, staff, and students, followed by reviews and cost analyses. Over 2000 citizens then attended public meetings held throughout the district to discuss the alternatives. The superintendent finally reviewed 4000 recommendations; her final choices were approved unanimously by the board of education.^[6]

Citizen advisory committees are another participatory mechanism applied to the budget process. These may be used during budget preparation, as a review of the proposed budget, or may deal with specific programs, such as the Capital Improvement Program, Community Development Block Grant funds, or social service agency funding. Advisory committees allow members to develop expertise in an area, so that input may be broader and more in-depth than that received

through surveys or public meetings. However, these mechanisms can require more effort and time on the part of both city administrators and participants, and may not be representative of the community.^[3] A study of advisory committees in New Jersey municipalities found that committees were perceived as effective when the appointment process was democratic, and the committee had clearly stated goals and objectives.^[7]

Some communities use several types of participatory mechanisms in conjunction with each other. Eugene, Oregon, in the face of severe fiscal stress, developed a deliberative process, with a series of input methods, including public meetings, a budget-balancing exercise, and citizen surveys with varying levels of service cost information provided.^[4] Hillsborough County, Florida, combines a series of public hearings during budget consideration with community meetings throughout the year, advisory committees, and surveys.^[8] The benefits of one method can offset disadvantages of another.

FREQUENCY OF USAGE

To what extent is input sought in the budget process? Participation in budgeting is apparently relatively low in local governments, which is where most surveys have been conducted. One study found extensive use of public hearings and budget summary documents across various local government types, but little usage of other methods; larger jurisdictions (over 100,000) were more likely to use these tools than smaller ones.^[9] A 1996 International City/County Management Association (ICMA) survey of managers in council-manager cities also found larger cities more likely to use participation, but the overall levels were not high. Only 18% of respondents hold community meetings for budget development input, and 32% receive formal recommendations from citizen groups during city council consideration of the budget. The most-used methods in these cities were those that simply provide information to the public, rather than seeking input.^[10]

A study based on interviews with 28 midwestern city budget directors found that only 21% have used participation mechanisms during development of the budget proposal. Approximately one-third use input from surveys or strategic planning sessions that are not directly budget related, whereas another one-third allow input for allocation of specific funds, such as the Community Development Block Grant (CDBG). Many of these cities focus their efforts on improving communication of the proposed budget to the public, rather than encouraging citizen input.^[11]

A citizen participation survey of chief administrative officers in cities with populations over 50,000 found that 96.9% hold public hearings, 81.6% use citizen advisory boards, 52.9% use citizen surveys, and

56.5% use citizen focus groups. When asked about participation in specific functions, 46.2% reported active involvement by citizens in the budgeting function (as compared with 93.9% for zoning and planning, 87.1% for parks and recreation, and 72.5% for policing and public safety). Again, larger cities reported more participation.^[12]

Overall, then, there is some movement toward increasing citizen input in the budget process, but it is stronger in larger cities than smaller jurisdictions. Also, much of the participation effort remains at the end of the process, rather than during budget development, and with attempts to improve communication and education of citizens.

EFFECTS OF PARTICIPATION

Measuring the usage of participatory mechanisms is easier than determining the actual effects of citizen input. Empirical evidence, beyond anecdotes and individual perceptions of effectiveness, is limited. Survey respondents believe that citizen input affects budget decisions; in the earlier mentioned study of budget directors, 77% of respondents agreed that input definitely influenced decisions.^[11] Citizen survey priorities also appeared to affect capital spending decisions in Auburn, Alabama.^[2] The Eugene, Oregon, city council acted on the budget strategies identified through their deliberative process.^[4] A case study of participation in two cities, however, found little evidence of decision-making effects.^[13] We cannot conclusively state the effects of participation on budget decisions, though, without knowing what would have happened in the absence of citizen input.

Decision making is not the only possible benefit from participation. "For administrators, those benefits can include better information on service needs, more services for the dollar, and better feelings about their work. For citizens, the gains can include services better suited to their needs, a more accessible and responsive public bureaucracy, and more positive feelings about themselves and government."^[3]

Much of the work in this area stresses the advantages of educating the public in budget complexities and providing people an opportunity to be heard.^[11] Information may affect citizen perceptions. For example, the city of Dayton, Ohio, uses community boards to improve neighborhoods; with their support, the city has not lost a tax election in 20 years.^[14] In studies of the Eugene case, the amount of budgetary information provided to citizens, as well as the citizen's use of services, affected their revealed preferences.^[4]

This increased openness may increase public trust in and support for government. Wang found that managers perceived the use of general participatory

mechanisms to be associated with increased public trust in government, although this was not the case for specific functions such as budgeting.^[12] In addition, input can provide officials with information on where they need to better market and communicate their proposals. For example, in the Auburn surveys, the areas considered to be high priorities to city council were not seen this way by the public, so the council improved publicity and communication regarding the importance of these projects.^[2]

OBSTACLES

The literature centers around three primary sources of obstacles to citizen participation. The first is the public itself. There are various “publics,” not one homogeneous whole; some people want to be active, for different reasons, whereas others do not, and still others could possibly be reached with some effort.^[5] Lack of knowledge and time, apathy, and perceptions that their opinions are unwanted often lead to low and non-representative participation levels.^[11]

Second, structuring budget participation to be meaningful and effective is difficult. As noted earlier, different methods have distinct advantages and disadvantages; public hearings that are accessible to everyone often are less useful for two-way communications and for educating citizens than are advisory committees or prioritization exercises with smaller groups of people. Timing is also an issue. Opportunities for budget input are often placed at the end of the process, although it would presumably have more of a chance to affect decisions if it occurred earlier. Finally, some mechanisms are very costly, requiring considerable effort on the part of both citizens and public officials.^[6]

Third, public administrators and elected officials may resist increased citizen input. Expert professional administrators may feel better able to make decisions on complex issues.^[3] Research has found that finance officers are interested in participation, but that they would rather have it be initiated by elected officials than administrators.^[5] Some elected officials, though, believe that they already have ample ways to find out what citizens want and believe that formalized group mechanisms are unnecessary given the increased access that citizens have to individual elected officials through e-mail, etc.^[15]

EXIT, VOICE, AND LOYALTY

Albert O. Hirschman, in his book *Exit, Voice, and Loyalty*,^[16] suggested that members of an organization (or customers of a firm) can use some combination of

these three mechanisms to respond to declines in product/service quality. In some cases, this decline may arouse primarily voice from the members/customers, while the organization may actually be more sensitive to exit (or vice versa), so will not take appropriate actions to halt the decline. Therefore, institutional mechanisms are important to have greater congruency between the member's response and the organization's sensitivity. In the current case, then, giving citizens greater opportunities to express their “voice” by participation in the budget process can help to provide valuable signals to governments regarding organizational performance, which may both reduce the level of outmigration from the jurisdiction and allow the government to “fix” the problems. If people believe that voice will be effective, they may postpone exit, especially if they have loyalty to the organization.

As noted earlier, serious concerns in this area revolve around the frequently low levels of participation and the potential that participants are not representative of the community. In some sense, Hirschman suggested, that may be positive rather than negative. It is better to have a mix of “alert” and “inert” customers/organizational members. In this way, sufficient numbers of citizens use voice to let the organization know that there are quality concerns, but the quiet public gives the organization time to address the issues before massive exit. Also, with limited use of voice, citizens retain “reserves” of resources to be used in extreme cases when they are most needed. In addition, in some cases, the “captive customers” for whom exit is the most difficult may actually have the greatest incentive to use voice to get the organization to pay attention.

Hirschman also discussed potential difficulties with the voice option. Voice can be overdone, to the point where protests may actually hinder rather than help organizational operations. In addition, the most quality-conscious constituents, rather than the “captive customers” may be more likely to use voice rather than exit in the short term. This can lead to class cleavages and more organizational sensitivity to the elite. If, however, the organization listens too much to the “captive customer” with loud voice and ignores individuals who are exiting as a result of dissatisfaction, the organization may face greater problems in the long run. The issue of representation, then, is an important one.

Hirschman's work sheds valuable light on the relationship between quality and price, and the potential response of customers/citizens to quality decline. However, determining the quality of government services is complex. The correlation between an individual's perception of government performance and their willingness to pay for services has been found to be strong for many people. However, there are also groups of individuals who are either willing to pay even though they believe performance to be low, or

vice versa.^[17] In addition to the value of citizens using voice to signal dissatisfaction, governmental officials may be able to use their own voice to provide more information to citizens regarding the true cost of services, and can use performance data to convince some that government performance is better than commonly perceived. Hence, the efforts by many jurisdictions to increase opportunities to educate citizens in budget issues.

The greatest challenge in applying Hirschman's thesis is that he concludes that it is difficult, if not impossible, to find a stable optimal mix of exit and voice. "Once members have a slight preference for, say, voice over exit, a cumulative movement sets in which makes exit look ever less attractive and more inconceivable. As a result, voice will be increasingly relied on by members at a time when management is working hard to make itself less vulnerable to it."^[16] For this reason, organizations may have to go through cycles with exit and voice alternating as dominant mechanisms. This suggests the difficulty in institutionalizing budget participation mechanisms that will be optimally effective in the long run, because officials will become less sensitive to voice over time and may eventually simply pay lip service to citizen demands.

CONCLUSION

The citizen participation literature has focused on the voice option, without specifically addressing the role of citizen exit from the community. To what extent do citizens leave a community due to dissatisfaction with service quality or taxation levels? Does citizen participation actually reduce or delay the degree of exit? These are questions that require future research.

Efforts to enhance citizen input will undoubtedly continue to gain momentum, and we will hopefully accrue more hard evidence of the effects of participation. Mechanisms can be designed to provide congruence between citizens' need for voice and government officials' sensitivity to this voice. However, we also need to heed Hirschman's warning that officials will not be sensitive to voice forever, and the pendulum may need to shift toward a greater sensitivity to citizen exit from the community at some point.

City Government

Jon C. Teaford

Department of History, Purdue University, West Lafayette, Indiana, U.S.A.

INTRODUCTION

City government has adapted markedly to the changing demands of exploding urban populations. Throughout U.S. history there has been a strong deference to grassroots authority, and this has ensured local governments a major role in public policy developments. In the nineteenth century, city leaders offered a growing list of services to urban dwellers, while facing complaints about corruption. Reform-minded citizens of the late nineteenth and early twentieth centuries revised the structures of local rule and invented new schemes of municipal government. Suburbanization in the twentieth century produced a fragmentation of local authority, as metropolitan residents migrated to myriad suburban municipalities, and thereby avoided the taxes and social problems of older central cities.

HISTORY

Since the first European settlement of North America, there have been city governments. The earliest municipal corporations were patterned after European models. During the Middle Ages and early modern era, European cities acquired charters from the crown that granted them a degree of self-government and certain immunities from royal interference, as well as valuable commercial privileges. These European municipal corporations largely existed to promote and regulate trade, and to protect the interests of artisans and merchants. Similarly, the first North American city governments operated under royal charters that authorized them to regulate local trade activities and bestowed certain lucrative privileges on the municipal corporations. The corporation of Albany, New York, enjoyed a monopoly on the fur trade, and New York City was granted ownership of all tidal lands surrounding Manhattan Island and profited from a monopoly on local ferry service.^[1]

During the eighteenth century, city functions expanded as fire protection, street lighting, and the regulation of such nuisances as stray livestock assumed new importance. Moreover, the American Revolution shifted responsibility for the granting of charters from the crown to the state legislatures. During the nineteenth century, the legislatures granted virtually any

petition for a municipal charter and eventually adopted general incorporation laws to free themselves from the burden of enacting hundreds of charters. Municipal incorporation became a right rather than a privilege. Any locality of a few hundred residents could establish itself as a municipal corporation.

This pattern of permissive incorporation reflected the emerging American deference to grassroots rule. Generally, if local voters wanted to incorporate or annex their property to an existing city, it was their business and the state governments would allow them to determine their own destinies. State legislatures did interfere with city governments, and sometimes ignored the petitions of mayors and city councils. But interference usually arose at the behest of some local faction seeking a favor; it did not necessarily express the state's interest in systematic central control. If a locality requested a charter amendment or authorization to exercise a new power and there was no organized opposition at the local level to the request, then the legislature would generally approve the petition. In the United States, local governments were means by which the people of a locality could express and fulfill their needs. In contrast, throughout most of the world, local government was a means by which the central authorities could administer localities, and ensure the order and safety of the populace. This contrast between top-down authority and grassroots rule continued to differentiate American city government from local government elsewhere in the world.

During the nineteenth century, the largest cities in America and Europe expanded their functions and developed bureaucracies. In 1829, the creation of a uniformed, full-time police force in London, supplanting the earlier constable-night watch system, set an example for cities throughout the English-speaking world. Between 1840 and 1870, the major American cities established professional, full-time police and fire-fighting forces, the largest of which included thousands of men by the close of the nineteenth century. The growing cities also constructed great water supply systems and expansive sewerage networks. Moreover, by the end of the nineteenth century, New York City, Philadelphia, and Chicago could each boast of thousands of acres of public parkland rivaling the great urban preserves of London and Paris.^[2]

Accompanying these developments in the United States was a growing chorus of complaints about corruption and incompetence in city government. The native-born elites resented the rise of immigrant voters and politicians in the nineteenth-century city, and they were ever ready to expose any malfeasance of an Irish politician or police officer. Although city government provided unprecedented services, the newspapers and native-born commentators could point to some notorious examples of corruption in their indictments of city government. Thus, by the close of the nineteenth century, American city government was widely criticized and deemed a failure by many influential observers.

REFORM

The prevailing late nineteenth-century American obsession with corruption in city government was to have a profound influence on twentieth-century municipal development. Demands for administrative reform dominated the municipal dialogue of the early twentieth century, and there was persistent tinkering with the structure of city rule to achieve the honesty and efficiency, supposedly lacking in the government of America's great cities. The goals of honesty and efficiency were to determine the reform agenda of the twentieth century.^[3]

Beginning in the 1880s, civil service reform was a favorite of American good-government advocates, and gradually an increasing proportion of city employees enjoyed the protection of a civil service system. Consequently, the patronage power of city politicians declined, and demands for professionalism in government eroded the clout of party leaders. This was especially evident in police departments. Whereas nineteenth-century police forces were often tools of the politicians, and appointment and promotion were political favors, in the twentieth century, police reformers sought to cleanse departments of political influence and ensure a nonpartisan professionalism.^[4]

Meanwhile, reformers sought to limit the power of neighborhood-based ethnic politicians by curbing the authority of ward-elected city councils and enhancing the authority of the mayors. This contrasted markedly with developments in Canada and Great Britain, where city council committees remained the dominant policy-making element of city government and the mayor was largely a ceremonial figurehead. Suspicion of plebeian, neighborhood representatives led to a strong mayor structure in the United States with the executive, elected by the city's voters at large, exercising veto authority and broad appointive powers.^[5]

Another reform intended to ensure honesty and efficiency in American municipal government was the adoption of at-large election of city council members.

To eliminate ward representation and destroy the power of the supposedly venal ward politicians, municipal reformers advocated that all elected officials be chosen by the city electorate at large. Consequently, an increasing number of cities abandoned ward representation, or at least provided for mixed councils with some members chosen by neighborhoods and others by the citywide electorate.

To further improve city administration, Americans experimented with two new forms of rule: commission government and city manager rule. Originating in Galveston, Texas, in 1901, the commission plan placed all executive and legislative authority in the hands of a small board of commissioners elected at large.^[6] During the 1910s, the city manager plan superseded the commission scheme on the reform agenda. Under manager government, the city council remained in charge of basic policy making, but implementation of that policy and the administration of city services was the responsibility of the city manager. This manager was ideally a nonpartisan professional appointed by the council to ensure expert administration. The early city managers were often engineers with a devotion to efficiency and an expert knowledge of public works.^[7] Whereas commission government lost favor, the city manager plan was adopted in municipalities throughout the United States and in Canada as well. By the close of the twentieth century, more American municipalities operated under the manager plan than under the mayor-council scheme.^[8]

During the late nineteenth and early twentieth centuries, the tradition of deference to the locality was reinforced through the adoption of home rule measures. Viewing the state legislature as a channel through which corrupt local interests could obtain their selfish ends, good-government reformers in the United States sought to close this avenue to nefarious gain. Home rule provisions in state constitutions forbid state lawmakers to legislate on questions solely of local concern, and authorized cities to draft their own charters and charter amendments that would take effect subsequent to approval by the city electorate.^[9]

LATE TWENTIETH-CENTURY DEVELOPMENTS

During the second-half of the twentieth century, the reform mentality remained influential in the United States, although some questioned the merits of the structural and administrative changes of earlier years. The number of American cities adopting manager rule continued to increase. The new breed of managers often were graduates of university city management programs, not simply engineers with some background in the planning and administration of public works. Moreover, an increasing number of mayor-council

cities were hiring chief administrative officers to assume charge of municipal administration without compromising the strong mayor's policy-making or appointive powers. In other words, these officers provided administrative expertise, but unlike city manager municipalities, the mayor was not reduced to a ceremonial figure, presiding over council meetings and cutting ribbons.

Not all elements of the reform agenda survived unscathed. At-large election of city councils came under attack, especially because it seemed to deprive ethnic minorities—who dominated a single neighborhood but were outnumbered citywide—of their fair share of council representation. Thus, there was some shift back to district representation, but at-large elections survived in many municipalities.

Meanwhile, the municipal bureaucracy became more entrenched, and police forces grew increasingly hostile to any civilian interference that threatened their professional independence. Amid the racial disorder of the 1960s, many observers called for civilian review boards to judge charges of police brutality. But such reforms made little headway, and elected officials often seemed impotent when faced with resistance from the city bureaucracy. Militant action by municipal employee unions in the 1960s and 1970s made this quite evident. Despite tight municipal budgets and citizen complaints about city employees, mayors and councils often had to concede cash and favors to the powerful municipal employee unions.

City leaders in the United States did, however, enjoy some new sources of revenue that helped to alleviate money worries. Before World War II, city governments depended overwhelmingly on property taxes for their revenues. Since the 1940s, state legislatures have granted cities the authority to levy a range of new taxes, weaning them from their overwhelming dependence on the property tax. In 1939, Philadelphia became the first American city to levy a municipal income tax, and some other large cities were to follow Philadelphia's example in the following decades. Similarly, municipal sales taxes proved a boon to many cities. In addition, during the 1960s and 1970s, federal aid to cities rose as Washington financed a larger share of the local government burden. Beginning in the late 1970s, however, the federal share began to decline, and Uncle Sam's short-lived interest in city government waned.^[10] The federal government's program of general revenue sharing with municipalities lasted only 14 years, from 1972 to 1986. Federal budget woes and declining political interest in a perceived urban crisis doomed prospects for federal munificence.

The aging central cities of the Midwest and the Northeast especially needed additional funding. Ringed by independent suburban municipalities, these cities could not annex additional territory. As well-to-do

residents and lucrative businesses moved beyond their boundaries, these cities watched their tax bases erode. Metropolitan reformers claimed that the answer to this problem was the creation of some form of metropolitan government that would distribute the burdens of governance more equitably throughout the urban region. Other nations had experimented with metropolitan governments. As early as 1888, the British parliament created the London County Council to assume certain areawide functions in the London region without destroying the many existing borough and city governments that continued to exercise local responsibilities. In 1953, the Ontario parliament established a metropolitan structure for Toronto, comprising the central-city municipality and surrounding suburban municipalities. The municipalities performed specified local functions, while the overarching metropolitan government was allocated regional duties. Political scientists praised the Toronto scheme as a model for American metropolitan reform, but in the United States overarching metropolitan bodies with authority over a range of functions were not a realistic option. In Great Britain, Canada, and much of the rest of the world, the central government could impose reform schemes on localities without winning prior approval from the voters in those localities. No popular referendum preceded the adoption of metropolitan government in Toronto. In the United States, however, the long-standing deference to grassroots opinion generally prevented the states from forcing their will on the localities and supplanting existing patterns of fragmented rule with metropolitan federations abridging the autonomy of area municipalities. Special-purpose metropolitan authorities did develop in the United States. Existing city governments were willing to abdicate responsibility for a single function such as water supply or sewerage, but Americans did not embrace metropolitan behemoths designed to largely supersede city rule.^[11]

CONCLUSION

At the close of the twentieth century, then, the American tradition of deference to local autonomy survived in marked contrast to the pattern of central control over local government found elsewhere in the world. In the United States, Canada, and Europe, the forces of professional city administration remained unabated. This was evident in the continuing popularity of the city manager plan in the United States and the increased reliance on chief administrative officers in American mayor-council cities and in European municipalities as well. Given rising concern about such regional problems as urban sprawl and

wasteful land-use patterns, it remains unclear to what extent American city governments will retain their autonomy, or whether city governments will yield power to regional authorities or confront greater interference from state lawmakers.

INTRODUCTION

This article discusses the civic duty of public administrators, based on legal, ethical, and practical interpretations of democratic citizenship. Civic duty refers to the rights, obligations, feelings, and habits of a citizen. A citizen has membership in a democratic state. A state is an independent country with defined territory. A state compels obedience from all who reside in its geographic domain because its sovereign commands absolute power internally. The sovereign's institutions promote a country's permanent interests—law and order, social stability, long-term prosperity, and national security. The relationship between a state and citizens is two-way. The state provides protection to citizens. In exchange, citizens accept the duty to obey the sovereign, to fulfill the requirements of citizenship, and to defend the state from external aggression. Adult residents who are not citizens do not enjoy the full protection or the rights therein of a state.

A democratic state is one in which the “demos”—the people collectively—are the sovereign; its defining characteristic is self-governance. In America, the founders vested the new country's sovereignty in the citizenry. The founders believed that citizens, as differentiated from a king's subjects, could govern themselves, because they could regulate themselves (Ref. ^[1], pp. xvii–xviii). Citizens regulate themselves when they are faithful to the duties associated with the status of citizenship. Citizenship takes two forms: legal citizenship and ethical citizenship; ethical citizenship has two subclasses—national citizenship and democratic citizenship. The meaning of civic duty is dynamic because the American state embeds the norms of citizenship in changing political institutions, legal rules, and democratic culture. American democracy involves citizens in the roles of private individual, political participant, and officeholders. Officeholders can have three identities: 1) political representatives, i.e., elected officials or lawmakers; 2) public administrators, i.e., bureaucrats or the civil service; and 3) and independent judges. In this analysis, we will limit our discussion to

citizenship and the civic duties of the public administrator. The following discussion explains each row of [Table 1](#) in turn.

LEGAL CITIZENSHIP AND LIMITED GOVERNMENT

Democratic government sets the foundation for legal citizenship. American government is a form of liberal democracy. Liberal democracy rests on the principle of limited government. This principle assumes that the citizens voluntarily surrender part of their absolute power as sovereign to government so that government can make decisions for the state. In exchange for the people's grant of some sovereign power, liberal democracy functions according to a constitution or charter. In America, the Constitution is written and sets the reciprocal relationship between individual citizens and democratic government. Besides enumerating the powers that the people have surrendered to government, the Constitution also lists the restraints on government. Its significance is that it is the supreme law of the land. All who reside in America are subject to it, including the popularly elected president, the head of state. The U.S. Constitution uses three other legal devices to protect citizens from government. First, it establishes a federal republic with dual sovereigns. Federalism means that two distinct governments exist that derive their powers directly and independently from the sovereign people: the national government and states. The Constitution assures a republican form of government in every state and at the national level. Citizens of one state enjoy the privileges of citizenship in every other state. It also guarantees to protect states from external invasions and domestic violence. Second, the Constitution secures citizens' civil rights and liberties. The U.S. Bill of Rights, constitutional amendments, and federal laws express these protections. Liberties, such as free speech, are inalienable and are immune from the arbitrary exercise of governmental power. Neither government nor a citizen can repudiate them or transfer them to another person.

Table 1 Citizenship, liberal democracy, and civic duty

Types of citizenship	Characteristics of liberal democracy	Norms for citizenship	The civic duty of public administrators
Legal citizenship	Limited government	Personal responsibility	The higher standard of conduct
National citizenship (ethical citizenship)	Good government	Caring for public interests	Office as public service
Democratic citizenship (ethical citizenship)	Potential responsiveness	The civic culture	Citizenship as office

Third, the Constitution authorizes the principle of reserved powers. Amendment X gives to the states or the people the powers that the Constitution has not explicitly granted to the national government or withheld from the states.

Pluralism and Civil Society

Liberal democracy presupposes the existence of a pluralist civil society. A pluralistic society divides a democratic state's power into open and competing groups instead of concentrating it in a ruling elite. Pluralism creates a civil society. Civil society is broader than government, giving citizens a private (social) life and a political life. Citizens get a unique identity by pursuing personal interests, including family life, in private (non-governmental) associations. The premise is that only citizens can define their interests. Self-interested citizens advance their interests by joining groups of similarly minded individuals. Pluralism assumes that a check on group power occurs as self-interested individuals shift their allegiances from group to group in response to changing perceptions of their own interests.^[2] Citizens' groups align with others in the political arena to advocate for policy preferences and to achieve favorable outcomes. Politics is the mechanism for aggregating and converting individual preferences into collective decisions. In theory, this conversion takes place in the competitive processes of responsible parties and within a set of legal rights and political rules.^[3] Backed by political authority, these collective choices compel obedience.

Civic Duty and Personal Responsibility

Citizens in liberal democracy can assume the identity of a private citizen, a political participant, or an officeholder. All have a duty to be responsible. Personal responsibility for private citizens means that individuals voluntarily restrain their behavior. They choose to restrict themselves not to interfere with others' private lives, liberties, and interests. In exchange, responsible citizens have the right to expect others to do the same. Furthermore, citizens' private lives have

legal protections. Democratic government has a duty to avoid arbitrary intrusions into the citizenry's private affairs and can only do so reluctantly after following due process. Personal responsibility also means that citizens have a civic duty to participate in democratic political processes. Political participation is necessary, because the legitimacy of democratic government depends on it. It allows the citizenry to show consent. Showing consent legitimates democratic government's use of the state's power. Citizens show consent indirectly by voting for political representatives who, in turn, conduct the "people's business." Voting depends on three principles. First, citizens stand as political equals. Second, liberal democracy holds open and free elections at regularly scheduled intervals. Third, democratic government has an obligation to count each citizen's vote. Personal responsibility for elected officials means that they encourage pluralistic participation, grant access to citizen groups, broker exchanges among competing interests, and enforce contracts. Political representatives grant the right to exercise limited discretion to public administrators so that democratic government can listen and respond to legitimate group interests. Elected officials control administrative discretion by organizing government agencies into hierarchies and through legislative oversight. The electorate has the power to replace democratic government if the voters perceive officeholders as unresponsive or even to change the Constitution.

The Higher Standard of Conduct

In democratic theory, the position of a free and autonomous citizen is the most esteemed identity. Citizens who serve in government must surrender more rights and democratic freedoms to government. The democratic sovereign restricts the conduct of officeholders because of its distrust of concentrated political authority. Therefore, some actions of private citizens are illegal if done by political representatives or public administrators. The restrictions of office translate into a higher standard of conduct. Legislative codes, conflict of interest statutes, and criminal sanctions

operationalize this higher standard. In exchange for discretionary authority, public administrators must follow the rules of their office. Legal requirements exist for public administrators to carry out their office with political impartiality and professionalism. They have a duty to respect election outcomes, to support democratic processes, and to act as rule-abiding trustees (Ref.^[4], pp. 154–155). Administrators must submit to sanctions if a legislative review finds that they have failed to discharge these duties properly. Impartiality and professionalism counteract the partisanship and ideologies of popularly elected officials. One school of thought frees public administrators from legal restraints, obliging them to disobey evil-minded elected officials in times of crises. If nefarious elected officials capture the state's absolute power and present their unconstitutional activities as those of the democratic sovereign, then dictatorship happens, as in Nazi Germany. According to March and Olsen, public administrators in similar situations must actively thwart the wishes of iniquitous political officials (Ref.^[4], pp. 86–89).

NATIONAL CITIZENSHIP AND GOOD GOVERNMENT

The legal foundations of citizenship are incomplete. Citizens who possess legal and civil rights in a pluralist society do not automatically feel political allegiance to their country.^[5] To stimulate national citizenship, the American founders vested the sovereignty of the new country in the political community, not the electorate. This political community encompasses the nationwide body of citizens as they interact informally and formally in social, religious, economic, cultural, and community associations in their localities.^[6] By vesting sovereignty in the national political community, the founders broadened the idea of citizenship to include an ethical dimension. Ethical citizenship refers to the moral beliefs, values, fraternal feelings, habits, and reciprocal commitments of individuals that guide their lives. Whereas legal citizenship is expressed in laws and rules, ethical citizenship is in standards that most people acknowledge but are not codified. Ethical citizenship is always a matter of voluntary behavior and is subject to different interpretations by different people.

The founders rooted the political community in a culture of “good government.” Political culture refers to the citizenry's attitudes about the style of democratic governmental operations.^[7] Good government, as opposed to perfect government, is based on legitimacy that extends beyond electoral popularity. This means that democratic government must defend its legitimacy on higher (normative) values. It is not

enough for government to appear good; its actions must be good. To make government's actions “good,” officeholders are bound to justify publicly and receive approval from the democratic sovereign (not just the electorate).^[8] In obtaining prior approval, officeholders determine whether their proposed actions are ethically appropriate, i.e., have wide community support. For March and Olsen, the ethic of appropriateness means that government acts consistently with cultural and political norms.^[4] This ethic reassures the democratic political community that officeholders will not act arbitrarily nor for purely private interests. The actions of good government strengthen the democratic sovereign's confidence in those to whom it has entrusted the state's power.

Civic Duty and Caring for Public Interests

Membership in the political community gives citizens a public life besides a private life. In public life, citizens actively maintain public purposes, based on a perception of national solidarity and a sense of a common destiny. For Norton Long, a precondition of legal citizenship is that citizens have a sense of “*moi commun*.”^[9] Communal feelings stir in citizens, he says, if “a public thing” quite literally exists for which they feel responsible. For John Dewey, this public thing emerges when citizens rediscover the “public and its interests.”^[10] A political community of citizens, he says, cares for public interests. To care for public interests, citizens must engage each other to discern common needs. This task requires citizens to reflect and to distinguish between the special case (their own interests) and the general case (the interests of others). In other words, citizens use moral reasoning to perceive the difference between public interests and private interests. According to Dewey, people create private interests when they join voluntarily, and only those people involved in a transaction experience the direct or indirect consequences of those interactions. Public interests are not fixed. They emerge when individuals as a group are seriously and indirectly harmed by the consequences of transactions in which they have not engaged. Although citizens may disagree, their open discussions about public interests allow the political community to search for remedies.

Caring for the public gives diverse citizens a common ethical identity. Public spirit awakens this identity in citizens. The civic virtue of private citizens is the source of public spirit. Public-spirited citizens participate in public life when they perceive that the personal advantage of each member of the community is consistent with working for the good of all. Alexis de Tocqueville called this disposition of American citizens “the principle of self interest rightly understood”

(Ref.^[11], pp. 129–132). Citizens live this principle daily in small acts of self-restraint, not through great sacrifices. Such daily actions, said de Tocqueville, gradually draw individuals through their habits in the direction of the national political community. Virtuous citizens, acting on this principle, voluntarily help others. In place of doing it themselves, they willingly give up additional personal resources to sponsor community programs aimed at serving the poor and at improving society. De Tocqueville said that this public role for private citizens is based on custom, not law. This custom binds together the nation, allowing diverse citizens in the political community to lead a good life. For Dewey, public life is a good life. A good or high-quality common life emerges only if a democratic state is a good state. A good state comes into existence when trustees of the public (lawmakers and public administrators) systematically care for public interests. In the good state, citizens have greater liberty and security in their private affairs because they are relieved from the waste of negative struggle and needless conflict (Ref.^[10], pp. 71–72). Its community-based processes, by promoting reflection, moral reasoning, and open discourse, civilize humanity, allowing citizens to show empathy, tolerance, and generosity (Ref.^[4], p. 60).

Office as Public Service

For Dewey, the public is vital to the creation of government. Government is the public organized to carry out the functions of the state in a way that strengthens bonds among citizens. The sovereign political community connects the power of the democratic state to care for public interests through government officials. It gives them the use of the democratic state's power to regulate the conjoint actions of individuals and groups that cause a public interest to emerge. Different issues create different public interests. As trustees of the public and its interests, public administrators hold the office of a public servant. The duty of public servants is to recognize the dynamics and the consequences of individuals "acting as a public." According to March and Olsen, the political community's discussions about public interests should guide and restrain public servants' actions. By listening to these discussions, public servants will get an idea about what governmental actions are acceptable to the larger political community on moral grounds. These discussions reveal the issues that government should avoid or remove from the policy agenda because of a lack of wide acceptance. By withdrawing these issues temporarily, public servants help to prevent the polarization of the community. Moreover, the influence of community discussions on public servants allows the democratic sovereign to civilize government.

Ethical Maturity

This task of public service requires ethically mature officeholders. Ethically mature public servants, said Stephen K. Bailey, appreciate the reality of self-interest and its impact on motivating behavior, both public and private:

... Public service is the capacity to harness private and personal interests to public interest causes. Those who will not traffic in personal and private interests (if such interests are within the law) to the point of engaging their support on behalf of causes in which both public and private interests are served are, in terms of moral temperament, unfit for public responsibility (Ref.^[12], p. 47).

Ethically mature public servants, said Bailey, possess three moral qualities: optimism, courage, and fairness tempered by charity. Optimism allows public servants to see possibilities in shifting political priorities so that they can perform the functions of government without becoming cynical. Optimistic public servants are motivated to better society and to improve the quality of human life. Cynical officials who perceive humankind as unworthy of such efforts are the ultimate source of corruption in a free society. Courage overcomes the forces of private relations, especially friendship, and provides a degree of neutrality to override requests for special favors. Ethical courage means that public servants are willing to decide even with inadequate information. Ethical courage is meaningless unless it enables public servants to act justly. Fairness tempered by the virtue of charity promotes justice. Charitable public servants discipline themselves by controlling persistent inner claims for personal recognition, power, and status. Charity is also a source of visions for the "good society" without which government, said Bailey, becomes "a sullen defense of existing patterns of privilege" (Ref.^[12], p. 52). Fairness compensates for the subjective nature of all decision making. Fairness is necessary because of administrative discretion. Fair-minded public servants control their discretion by balancing flexibility and consistency in their decisions. As Bailey pointed out, public administrators who never deviate are rigid and lack compassion; those who deviate too much are subversive. The ethical compromises of mature administrators allow them to act with enough consistency and flexibility to survive and succeed in public service.

CHALLENGES TO NATIONAL CITIZENSHIP

At the end of the twentieth century, scholars have identified at least five challenges to national citizenship

in America. First, Robert Putnam argued that American life lacks communal solidarity. Instead of a “nation of joiners” with a vibrant public life, Americans are “bowling alone,” and their civic life has all but disappeared (Refs.^[11], pp. 114–118,^[13]). Second, scholars have identified a societal malaise: widespread alienation of citizens from government. For example, Evan Berman’s national survey identified three sources of citizen discontent: 1) government officials whom citizens perceive as indifferent or hostile to their needs; 2) poor service delivery; and 3) governmental processes that exclude citizens.^[14] Third, the emergence of the welfare state has significantly undermined the citizen–government relationship. Specifically, Don Eberly said that Americans have assumed problematic identities as clients, customers, consumers, and claimants of government:

The provision of public assistance to tens of millions of Americans is often accompanied by the subtle message that recipients are hopelessly trapped in conditions that require the permanent help of advocates, interest groups and government workers. It produces a mindset that dwarfs citizenship for the poor and the non-poor alike. It leaves the poor feeling justified in doing little to reclaim control of their lives and the non-poor feeling no obligation to intervene with neighborly aid (Ref.^[1], p. xxix).

Fourth, in a comprehensive study of citizenship, Rogers Smith found that liberal democracy is not the core meaning of the American civic identity.^[15] Clashing traditions and popular politics have excluded most Americans from enjoying full citizenship. Fifth, Chester Newland argued that a pervasive system of spoils at the national level excludes most of the public administration community from important matters of governance (Ref.^[16], pp. 45–56). This exclusion undermines the capacity of American democracy to function adequately or to achieve social change. Some fixes to these problems of national citizenship, such as Benjamin Barber’s “strong (grassroots) democracy,” aim at weakening liberal democratic institutions and basic protections.^[17] A more constructive approach is not to deny democratic liberal traditions. It draws the norms of ethical citizenship from the operations of successful liberal democracies. If democracy is to endure, then pragmatic realism must temper the idealistic notions of citizenship.^[18]

DEMOCRATIC CITIZENSHIP AND POTENTIAL RESPONSIVENESS

E.E. Schattschneider provided a realist’s view of democratic citizenship. The most damage to the democratic

cause comes from idealists who attribute a “mystical, magical omnipotence” to the people (Ref.^[19], pp. 135–136). This attribution takes no heed of what the democratic system can do. Involving 280 million people directly in all aspects of governance is physically impossible. Instead, he assumed that democratic citizens were moral equals: Each person is a precious and unique human. Morally equal citizens have potential involvement. Potentially involved citizens become active in public affairs because of a democratic dynamic: conflict is contagious. Different public issues activate different citizens. If only 0.10% of the citizenry mobilizes around an issue, then the latent force of the remaining citizens is 999 greater than that of the activists. Schattschneider’s point is that any estimate of citizen participation based on the number of original activists is fatuous. Potentially involved citizens are not neutral spectators. Public issues succeed or fail because the original activists mobilize or exclude the spectators. The balance of citizen involvement in any public issue, he said, is not fixed until *everyone* is involved (Ref.^[19], pp. 4–5).

From this analysis, Schattschneider recasted the meaning of citizenship. He made its characteristics consistent with what most citizens can and are willing to do in public life. He said that the role of democratic citizens is the same as in private relationships: People take advantage of what other people know and judge results. In public affairs, citizens rely on government leaders and organizations, or their responsible opposition, to give them choices about policy alternatives. These choices must allow citizens the potential to participate in meaningful ways. In this democratic system, the sovereign people “act through the government.” This system satisfies citizens only if it meets the condition of “potential responsiveness.” Potential responsiveness in a democracy, said Hannah Pitkin, requires citizens to have: “. . . access to power rather than its actual exercise . . . There need not be a constant activity of responding, but there must be a constant condition of responsiveness, of potential readiness [of government] to respond.”^[20] If citizens perceive potential responsiveness in the democratic system, then they feel that they can initiate action or trust leaders to do the right thing. Citizens accept governmental authority despite their lack of awareness of what government is doing most of the time. These beliefs are a part of the democratic civic culture.

The Civic Culture

According to Gabriel Almond and Sidney Verba, the civic culture shapes the norms for citizens and their relationships to each other and to their democratic government.^[21] Their comparative analysis of five

democracies, though drawn in 1963, remains the classical formulation. It showed that stable democracies have democratic civic cultures. They described the American civic culture as mixed. Citizens' activity in public life combines involvement and activity with passivity and non-involvement. They take on and balance the duties of three identities: the influential activist, the passive governmental subject, and the parochial (family-oriented, private) person. Almond and Verba found that the norms of trust and confidence from citizens' social interactions transfer to their political relationships and temper them. They also found that the interactions of citizens and government showed a cyclical pattern. In normal times, most citizens are quiescent. They are uninterested in what decision makers do, but officeholders can act only within legal and ethical bounds. If an issue becomes salient, then citizens will increase their involvement with government, making demands on elected officials and public administrators. If government officials make appropriate adjustments, then the importance of politics will lose saliency for mobilized citizens, and they will withdraw from active participation. This cycle allows a democratic system to change slowly and humanely. If issues become and remain intense, then they destabilize a democracy.

Almond and Verba's research showed that the cycle of political participation strains neither people nor liberal democracy. The reason is that the civic culture controls decision makers without checking them so tightly as to render democratic government ineffective. The check and balance occur for four reasons. First, democratic government officials subscribe to the belief in the influence potential of citizens. Second, government decision makers anticipate citizens' reactions even if citizens are not active or making demands on them. Third, government officials and citizens are part of the same political community. They share the same civic culture that exposes them to the same democratic values. Fourth, public and private life are not opposites in the civic culture. The democratic culture mixes the personal, social, and political identities of citizens. It socializes government officials to uphold a continuum of public-private relationships that flourish legitimately in the political community.

Citizenship as Office

Terry Cooper formulated an ethic of citizenship for democratic public administration. He assumed that citizenship underpins all normative relationships in the political community. Citizenship, in his conceptualization, is the public office of virtuous individuals in the political community. Public administrators are citizens first. They are virtuous citizens "employed

as one of us to work *for* us."^[22] In office, they are fiduciary citizens. Acting as trustees for the political community, virtuous administrators make citizens part of the administrative role. Efficient service delivery and law enforcement are their penultimate obligations. Their ultimate duty is to build and contribute to community life by sharing the sovereign's power, upholding civic values, and pursuing long-term interests. The authority relationships of virtuous administrators are both vertical and horizontal. They look at popularly elected politicians and to the citizenry for direction. For Cooper, the ultimate loyalty of virtuous administrators belongs to the citizenry because the citizenry's authority is that of the sovereign. The sovereign's authority transcends loyalty to specific elected officials or particular governmental agencies.

Virtuous administrators use transformational leadership practices to facilitate (or awaken) the involvement of citizens in public affairs. They combine their professional expertise and civic values in a way that gives citizens new and meaningful opportunities to participate in governance and for self-reflection (Refs.^[16], p. 53 and 55,^[23]). Their practices stimulate positive changes in individuals, institutions, and the community (Ref.^[4], p. 55). "Coproduction," "indirect administration," and "transparent decision making" are three examples of such practices. Coproduction, for Charles Levine, meant that virtuous administrators involve active citizens as partners in allocation decisions regarding service delivery.^[24] For Cooper, virtuous administrators engage in indirect administration by subordinating their technical expertise to active community leaders. They engage in policy deliberations by working through and respecting existing communities and their associations and authorities. Cooper said that administrators are justified to shed their neutrality and to act as policy advocates if their judgments are consistent with their roles as fiduciary citizens. Transparent decision making, said Carol Lewis, establishes the ethical credibility of public administrators.^[25] It is necessary because most administrative decisions take place without the physical presence of citizens. Credible administrators, she said, "go on record." By going on record, they publicly justify their decisions. This practice socializes them to account for their decisions even if citizens will not judge the results for years.^[26] Besides enhancing governance and enriching community life, these practices develop the character of democratic citizens.

Political Socialization

The development of democratic citizenship is a task of political socialization. Political socialization is concerned with the "personal and social origins of political

outlooks.’’^[27] It is the process through which citizens orient themselves to the political community, democratic government, and the civic culture. Political socialization begins early and is lifelong. It takes place in the family, peer groups, public schools, workplaces, and in political processes, although the quality of these experiences will vary. A liberal education is a vehicle for building citizenship in young adults. This broad education allows young people to reflect carefully about the human condition. It encourages them to use this learning to shape their lives as moral citizens and civilized human beings.^[28] Socialization also takes place in university-based Master of Public Administration (MPA) programs and through the associations of professional administrators, such as the American Society for Public Administration (ASPA) and the International City/County Management Association (ICMA). Finally, virtuous administrators socialize citizens. Their transformational practices connect citizens and democratic government. Virtuous administrators teach citizenship, using the experience of the political community.

CONCLUSION

Underpinning this analysis of citizenship and civic duty is the relationship between elected officials and public administrators. It touches on a fundamental political question: What is the proper balance between representative institutions and the civil service in a liberal democracy? Answers to this question are political as much as matters of law, ethics, and best practice. The terms associated with civic duty—the “common good,” “the public interest,” “ethical maturity,” and “the virtuous administrator”—are political terms. Political terms have ambiguous meanings, because no consensus exists on their definitions. This definitional ambiguity accommodates multiple interpretations of civic duty. For example, citizen-centered norms of civic duty prevail in the literature at the end of the twentieth century. Embedded in these norms is the following proposition: The citizen is supreme in governance, despite what legitimate elected officials want public administrators to do. This is an explosive proposition. It implies that the ultimate duty of the public administrator is to enable citizens to realize their view of the public interest. In effect, those professional administrators, through their citizenship identity, are preeminent over elected officials in democratic governance. As a political proposition, one can place this view at an extreme point on a definitional scale of civic duty. Given this conceptual placement, one can see why this interpretation of civic duty is controversial and is likely to elicit reactions. Moreover, political shifts in a changing environment are inevitable, and they will lead people

to challenge the prevailing conventions. For example, before the terrorists attacked America on September 11, 2001, national citizenship was a minor identity for Americans (Refs.^[1], p. xx,^[4] p. 72, also see the section on [Challenges to National Citizenship](#) in this article). Putnam’s “bowling alone” metaphor captures the view that civic duty was irrelevant in American society. After the attacks, national citizenship has become a primary identity for many Americans. In the catastrophe’s wake, the definition of civic duty has tipped to the other extreme. New interpretations have placed the preferences of elected officials as preeminent in American governance. These views contain another controversial political proposition: The ultimate duty of public administrators is to enable elected officials to realize their view of the public (i.e., national) interest. It implies that the public interest is whatever elected officials say it is. Our point is that the question of civic duty, as a political question, is one that a liberal democracy can never resolve once and for all. Inherent in the literature on civic duty are different and successive political interpretations of “who should govern.”

INTERNET RESOURCES

The National Civic League is the oldest civic organization in the country; see www.ncl.org. The National Association of Schools of Public Affairs and Administration is the accrediting body of MPA programs; see www.naspa.org. The American Political Science Association has formed a Civic Education Network; see www.apsanet.org/CENnet. This network has a list of more than 60 civic organizations; see www.apsanet.org/CENnet/organizations. Its list of teaching and research resources is found at www.apsanet.org/CENnet/resources.

Civil Disobedience

Matthew Tedesco

John Harris

Department of Philosophy, University of Colorado at Boulder,
Boulder, Colorado, U.S.A.

INTRODUCTION

An act of civil disobedience involves a violation of law with the intent of effecting a change in current policy, regarded as unjust by the citizens taking action. Important issues involved in civil disobedience include fidelity to the state, publicity of the disobedient act, the permissibility of violence in civil disobedience, and the acceptance of punishment on the part of the protesters. Civil disobedience was first explicitly discussed in detail by Henry David Thoreau, and later refined by activists such as Martin Luther King, Jr. and Mohandas Gandhi, and theorists such as John Rawls and Ronald Dworkin; however, its first important treatment is offered by Socrates, the ancient Greek philosopher, as presented in Plato's *Crito* and *Apology*.

KEY FIGURES AND IDEAS

As a matter of policy, it may appear strange for political theorists to attempt to justify a citizen's refusal to obey the law. One might think that if the government is, for the most part, just, then the citizens under the authority of the government always have a duty to obey the laws. Socrates (469–399 B.C.E.) appears to advocate just this position in the *Crito* when he stated, "...one must not give way or retreat or leave one's post, but both in war and in courts and everywhere else, one must obey the commands of one's city and country, or persuade it as to the nature of justice."^[1] It would appear that Socrates thought that one ought to obey the government regardless of what it commands. This is, in part, because Socrates thought that the laws of the state provided so much for him that he owed a debt of gratitude, and thus, fidelity to the law compelled Socrates to go so far as to give his life if necessary. However, in the *Apology*, Socrates appears to have said something quite different. Here, Socrates proclaimed before the court of Athens that, "...I will obey the gods rather than you, and as long as I draw breath and am able, I shall not cease to practice philosophy..."^[2] This example, taken from antiquity, shows that even Socrates, a man who eventually killed himself because he was commanded

to do so by the laws, thought that there are some laws that one should not obey. Even if we accept, as Socrates appeared to, that there are some laws that should be disobeyed, the question then becomes what differentiates an act of civil disobedience from a simple violation of the law, and when, if ever, is civil disobedience justified.

Modern interest in civil disobedience was rekindled by Henry David Thoreau. His essay "Resistance to Civil Government" (later known as "Civil Disobedience") was first published in 1849,^[3] and it served as an important influence on prominent social and political activists in decades to follow. In it, Thoreau addressed his reasons for refusing to pay a poll tax over the course of several years, an act of defiance that landed him briefly in jail until, to his consternation, an associate paid it for him and procured his release. Thoreau was primarily concerned with the evil of slavery, and specifically, the way in which his tax dollars causally implicated him in it—supporting the government that supported slavery. Thoreau took no issue with the immediate direction of taxes, such as his highway tax, in that paying it made him simply a "good neighbor." Furthermore, while Thoreau strongly disagreed with slavery, he did not think that any person's duty was to be devoted to combating serious wrongs. Crucially, Thoreau considered it every person's duty to make sure that a role, even indirect, in supporting serious wrongs was not played. It is this crucial causal link that led Thoreau to take action—in his case, refusing to pay the tax that indirectly attached him to the wrong.

Thoreau was explicit in his endorsement of breaking the law in actions of civil disobedience; even if these actions come at some substantial cost to the agent, these costs are simply outweighed by the importance of removing oneself from blameworthiness in the wrong being protested. He specifically acknowledged that this cost might include imprisonment or loss of property, along with other harassments. This is not to say, however, that he endorsed acceptance of punishment and, by extension, the legitimacy of government; he simply was at the mercy of something stronger than him.

Thoreau, then, introduced several important components to contemporary understandings of civil

disobedience, including the moral requirement of action, likely illegal, by private citizens, and the acknowledgment of the inevitability of punishment. In general, a key feature of Thoreau's presentation of civil disobedience is that it is in many ways indistinguishable from outright revolution. Thoreau blurs any distinction here by speaking explicitly and approvingly of revolution and "war with the State" within the essay, including the permissibility of bloodshed. This conflation can be contrasted with prominent advocates of civil disobedience in the twentieth century, beginning with Mohandas K. Gandhi.^[4]

Gandhi is perhaps most famous for endorsing and engaging in non-violent civil disobedience (an approach that Thoreau clearly did not advocate). Gandhi was primarily concerned with the British rule of India and sought through civil disobedience to achieve independence for his nation. For Gandhi, civil disobedience was merely a part of the broader movement of what he called *Satyagraha*, often described in English as something like "truth-force."

Gandhi offers two primary, related reasons for preferring non-violence to violence in acts of civil disobedience. The first concerns the nature of the action. That is, violent action, even taken in the service of some supposed greater good, is still by definition violent, and so evil. This evil cannot be eradicated, given the way it is contained within the act, and thus, the outcome of the action, while good, can only be temporary. Because violent action is by definition evil, while non-violent action is untainted by anger and hatred, Gandhi offers a second reason for preferring non-violent action: it is more effective. That is, because the pressure exerted on the state by non-violent civil disobedience is grounded in "goodwill and gentleness," it will more effectively and lastingly accomplish its ends than will violent action.

Another key element of Gandhi's discussion of civil disobedience was the notion of "self-purification" that the protester is required to first undergo. As Gandhi presents it, this self-purification is a deep and profound preparation, whereby the protester acknowledges the nature of the protest and what actions must be taken because of it. Like Thoreau, Gandhi acknowledges the hardships the protester is likely to endure; unlike Thoreau, Gandhi believed that these hardships must be voluntarily accepted. This voluntary acceptance and emphasis on non-violence are two of Gandhi's most important contributions toward a contemporary understanding of civil disobedience.

Martin Luther King, Jr. took up these elements in addressing civil disobedience in relation to the civil rights movement in the United States. In King's "Letter From Birmingham City Jail,"^[5] he echoes many of the key elements of civil disobedience presented by Gandhi before him. In advocating

non-violence as the appropriate means of civil disobedience, King explained that it is right because of its nature as a moral act, and because this moral foundation makes the act more effective in making the issue a focal point of public awareness. Like Gandhi, he advocated acceptance of the punishment, also calling the process "self-purification" and advocating this acceptance via workshops concerning appropriate behavior in civil disobedience. It was this acceptance of the state's reaction to civil disobedience that placed him willingly in jail, from where he wrote this famous letter.

King went further than Gandhi in making explicit the reasoning behind accepting the punishment of the state following civil disobedience. While Thoreau advocated violence and outright revolution in objecting to the state, King acknowledged the narrower focus that distinguished civil disobedience from revolution. That is, for King, it was not the state that needed to be toppled in the face of injustice, but rather the specific elements of law. In just this way, King preserved the notion of fidelity to the state that revolution denied. King mirrored the natural law tradition in drawing this distinction, explicitly citing Augustine's famous line that "an unjust law is no law at all." King took great care to point out the distinction between just and unjust laws, noting that he was solely targeting the latter.

Through Thoreau, Gandhi, and King, then, the notion of civil disobedience was importantly refined. Thoreau's primary concern was addressing the moral duty of the private citizen to be critical of the state through civil disobedience, while acknowledging the reaction that this protest would certainly elicit. Gandhi stressed the acceptance of this reaction, and crucially emphasized non-violent activity as the proper means of civil disobedience. King echoed Gandhi in these important refinements, adding a more detailed discussion of the manner in which civil disobedience targets specific laws of the state while preserving fidelity to the state, recognizing its legitimacy in spite of its endorsement of some unjust laws.

Contemporary philosophers and theorists, notably John Rawls and Ronald Dworkin, contributed to our understanding of civil disobedience by continuing to refine how it is defined. Rawls, in his book *A Theory of Justice*,^[6] argued that an adequate theory of civil disobedience would define and differentiate it from other forms of disobedience and specify the conditions under which civil disobedience is justified. An adequate theory also will explain the role that civil disobedience will play within the political system.

Civil disobedience, according to Rawls, involves a number of important features that serve to distinguish it from other forms of political action or protest. First, for Rawls, civil disobedience is an essentially political act, and thus is done openly and publicly. By engaging

in civil disobedience, one hopes to bring a claim of injustice to the attention of the populace. Because civil disobedience is political, one must appeal to those political principles that are widely accepted by the members of that society. Civil disobedience is an appeal to the majority and its sense of justice, and by engaging in civil disobedience, one hopes to show the majority that the policy or law in dispute is inconsistent with the society's shared political values.

This public, political appeal must be non-violent, because it is the final appeal to the society to have one's claim of injustice addressed. Like Gandhi and King, Rawls thought that civil disobedience should be non-violent, because it will be more effective in accomplishing one's goals. Violence or violation of another's civil liberties, Rawls argued, could obscure the justness of the claim that one hopes to bring before the majority.

Further, Rawls shared King's conviction that non-violence expresses one's fidelity to the law, and insofar as civil disobedience is a means of altering rather than replacing the current political system, non-violence is an important way of expressing such fidelity. Rawls explained that, while civil disobedience is done with the hopes of changing the laws, it necessarily involves the violation of laws. One need not violate the law that is being protested, but nonetheless, the civilly disobedient act is an act that violates the law. Thus, according to Rawls, civil disobedience is defined as "...a public, non-violent, conscientious yet political act contrary to law usually done with the aim of bringing about a change in the law or policies of the government."^[6]

Rawls contrasted civil disobedience with conscientious refusal. Conscientious refusal is the violation of laws or administrative orders because the laws or orders violate one's personal convictions. One may, for instance, refuse to obey a certain law because to do so would violate a strongly held religious belief. This is conscientious refusal, not civil disobedience as Rawls understood it. Civil disobedience and conscientious refusal are distinguished by a variety of features. For instance, conscientious refusal is not a public act. That is, it is not intended to address the majority's sense of justice. In fact, when engaged in conscientious refusal, one may wish that the disobedience remain unknown to the general population and the government. Further, conscientious refusal is not necessarily based on the shared political principles of the society. Conscientious refusal is not necessarily a political act and thus may be grounded in one's personal moral, religious, or philosophical convictions.

Rawls argued that civil disobedience is justified when three conditions are satisfied. First, civil disobedience is appropriate only when there are substantial and clear injustices. Rawls thought that the

most serious injustices will involve violations of liberty as opposed to economic injustices. Second, civil disobedience should generally be a last resort for bringing about political change. Before resorting to civil disobedience, one should exhaust all other options that may redress the injustice. That is, all other appeals to the majority as well as legal appeals have failed to resolve the problem, and thus, the only remaining option to rectify the injustice is civil disobedience. Finally, Rawls argued that one must not disobey if this will threaten the existence of the state. Rawls explained that for civil disobedience to be justified, it must not threaten the stability of the government. Because civil disobedience is intended to bring about improvements within the government, individuals must be certain they are not threatening its existence by raising the objection. If the government or society is particularly unstable at the time, or a number of other people or groups are engaging in civil disobedience, then this is good reason to wait until the society is stable enough to address another claim of injustice.

According to Rawls, civil disobedience will play the role of a stabilizing device within the state. Rawls claimed that, much like free and regular elections or a judiciary empowered to interpret the constitution, civil disobedience will play an important role in preserving the integrity of the legal or political system. Here, again, one can see the distinctively political role that Rawls reserved for civil disobedience. Civil disobedience is just another part of the system of checks and balances within Rawls's theory of justice. The legal philosopher, Ronald Dworkin, disagrees with Rawls and King on this account, and sees no reason to limit civil disobedience only to cases of political protest.

While Dworkin and Rawls's accounts of civil disobedience were similar, the two philosophers disagreed in a number of important respects. In his book *A Matter of Principle*,^[7] Dworkin argues that when one's morals, conscience, or integrity forbid obedience to a law or policy, then that person need not attempt to alter the law by other methods before refusing to obey. Such instances of what Dworkin called "integrity-based civil disobedience" justify one's refusal to obey, because when people violate their morals, conscience, or integrity in order to obey a law, they suffer immediate, irreparable harm by doing so. Thus, Dworkin broke from Rawls insofar as Rawls insisted that civil disobedience must be one's last resort. For Dworkin, one is justified in disobeying if the law requires a significant compromise of that person's moral, religious, or philosophic beliefs.

This is contrasted with justice-based civil disobedience which, according to Dworkin, is disobedience intended to challenge an unjust political policy or program. In those instances in which people

object to the law because they have a justice-based complaint, Dworkin argued that they must first attempt to exhaust all other political avenues for bringing about the desired change before resorting to civil disobedience.

Additionally, Dworkin, unlike Rawls, did not consider publicity to be an essential feature of civil disobedience. Some instances of civil disobedience, for instance, dodging the draft or ignoring slave laws, are best accomplished covertly. People may wish to be arrested and charged with a crime to bring their cause to the attention of the majority. But, in order to be an act of civil disobedience, an individual need not have to be charged with a crime or be publicly violating the laws that the individual deems objectionable.

CIVIL DISOBEDIENCE AND PUBLIC POLICY IN THE UNITED STATES

The civil rights movement of the mid-twentieth century in the United States offers no shortage of illustrations of civil disobedience in practice, and through them, we can evaluate their relation to public policy. Perhaps one of the more famous cases begins with Rosa Parks, who, on December 1, 1955, violated segregation laws in Montgomery, Alabama, by refusing to yield her seat to White passengers boarding a bus after her. Her subsequent arrest touched off a year of monumentally important social upheaval, culminating in the November 13, 1956, decision by the U.S. Supreme Court declaring bus segregation laws unconstitutional. This set the stage for further pivotal features of the civil rights movement, including the national prominence of Dr. Martin Luther King, Jr., the protests in Birmingham in 1963, and the Civil Rights Act of 1964.

Immediately following the arrest of Rosa Parks, the African-American citizens of Montgomery, led in part by Dr. King and his associates, launched a bus boycott that would last for months. In lieu of buses, participants in the boycott took taxis, engaged in car pools, or even walked, maintaining a solidarity that would inform and inspire the civil rights movement. All of these actions, however, stood in violation of existing anti-boycott laws, and led to the arrests of 89 African-American leaders, including King. When this tactic failed, local officials turned to less scrupulous means in an attempt to undermine the boycott. Fabricated violations led to indiscriminate arrests of African-Americans; those awaiting carpools were charged with crimes ranging from illegal hitchhiking to loitering. Laws were passed with the clear purpose of undermining the boycott; African-American taxi drivers, who had taken to charging African-Americans a lesser fare in order to support the boycott, were prohibited from doing so. The city then attacked the car

pools as a public nuisance interfering with private enterprise, a charge affirmed by local courts on November 13, 1956. This last step would have been devastating for the movement, had it not been for the Supreme Court's decision that day agreeing with a lower federal court's opinion that the segregation laws were unconstitutional—a case originating from Rosa Parks' refusal to pay the fine demanded of her for refusing to surrender her seat nearly a year earlier.

Montgomery, then, saw acts of civil disobedience against bus segregation laws and antiboycott laws, first by Rosa Parks and then by the African-American community participating in the bus boycott. These acts all challenged existing laws that were clearly unjust and did so while maintaining the non-violence described and practiced by King, among others. While official local response was frequently disgraceful, the federal judicial response saw through the moral bankruptcy of the laws and local officials in question and supported the Montgomery African-American community.

With regard to public policy, it is worth noting one of the two ways that acts of civil disobedience seek to effect change: through judicial review. That is, while acts of civil disobedience most often seek to generally raise public awareness of a wrong, change is most frequently brought about by two avenues: through judicial review or through legislative action. For law enforcement officials, such as the police responding to cases of civil disobedience, response options are likely quite limited; insofar as civil disobedience involves violation of law, law enforcement officials cannot themselves change policy. They must simply enforce the laws impartially. Acts of civil disobedience, however, are aimed beyond law enforcement at the laws being enforced. These acts seek to set a course of judicial review underway or to raise awareness such that lawmakers will respond through legislation. When Rosa Parks' lawyers advised her to decline to pay her fine, their purpose was to pursue a legal challenge that would impact public policy via judicial decision. Importantly, the civil rights movement set in motion in part by Parks' action led to the Civil Rights Act of 1964, illustrating the legislative avenue of change.

This example of civil disobedience allows a clear evaluation of official response, precisely because of the way in which the protesters were plainly supported by justice and morality. In retrospect, we see clearly not only that the laws were unjust, but also that local law enforcement was in the wrong in administering punishment partially and arbitrarily. Looking beyond the civil rights movement, other cases where we are less clear about the moral standing of protesters and those they are protesting are also available, such as those involving protest against nuclear power and weaponry.

Perhaps one of the most famous movements against the development of nuclear power occurred during the

late 1970s in Seabrook, New Hampshire. In 1977, a group calling themselves the Clamshell Alliance occupied the construction site of the Seabrook nuclear power plant. During the protest, the New Hampshire police arrested over 1400 members of the Clamshell Alliance. Refusing to post bond of \$1500, the protesters were in prison for 2 weeks until the charges were dropped, and they were released.

The Alliance not only brought attention to the anti-nuclear power movement, but also helped further develop techniques of civil disobedience. The Clamshell Alliance had no centralized leadership, but instead, it was composed of smaller support groups or cells. Without centralized leadership, decisions had to be made democratically, and this was at times a slow process; however, the advantage was that there was no figurehead, and thus those who opposed the movement had no clear target to attack. Decentralized group organization was adopted by a number of other groups whose members sought to resist nuclear power in their communities.

There have also been a number of civilly disobedient actions taken against nuclear weapons and their production. On September 9, 1980, eight people entered the General Electric Nuclear Missile Re-entry division in King of Prussia, Pennsylvania. While in the factory, the eight poured bottles of their own blood on documents and hammered on, and thus destroyed, two nose cone casings for nuclear warheads. This group, whose members called themselves the plowshares eight (alluding to a biblical passage that references beating swords into plowshares), was convicted of burglary, conspiracy, and criminal mischief. In February of 1984, the Pennsylvania Superior Court overturned the conviction of the plowshares eight. The appellate process continued, but the plowshares eight were never sent back to prison. This act started what has since become known as the plowshares movement.

The plowshares movement has continued to draw attention to the nuclear weapons debate by engaging in similar acts of civil disobedience. Similar to those committed by the plowshares eight. For instance, the group that came to be known as the minuteman III plowshares was clearly influenced by the actions of the plowshares eight. On August 6, 1998, the 53rd anniversary of the bombing of Hiroshima, Japan, activists Daniel Sicken and Sachio Ko-Yin entered a nuclear silo in Weld County, Colorado. Sicken and Ko-Yin poured blood and stenciled a broken rifle, the international symbol of disarmament, onto the concrete cap of the silo. They then hammered on the tracks used to slide the concrete cap back so that the missile may be launched. After bending the tracks and breaking the anchoring bolts that hold the tracks in place, the two men sat down on the concrete cap and waited to be arrested. Sicken and Ko-Yin were

later convicted of sabotage, conspiracy, and destruction of government property, and were sentenced to 41 months and 30 months in prison, respectively.

The prosecution and subsequent conviction of Sicken and Ko-Yin highlight a further matter of public policy related to civil disobedience. There is a great deal of disagreement about what is the appropriate governmental response to acts of civil disobedience. While most of the theorists and activists discussed here hold that those who violate the law must accept their resulting arrest willingly, it does not follow from this that the government should prosecute all those arrested. In fact, most will agree that the intentions and purposes of the individuals who engage in civil disobedience clearly distinguish them from common criminals. What is unclear, however, is whether the appropriate legal response to the common criminal is, for these reasons, inappropriate for the individual who engages in civil disobedience.

In his book, *The Morality of Civil Disobedience*,^[8] Robert T. Hall presented a number of possible legal responses to civil disobedience. The options discussed by Hall can be divided into three separate categories: one may refuse to prosecute any case of civil disobedience, one may prosecute selectively, or one may prosecute all cases.

The first possibility, advocated by legal philosopher Hugo A. Bedau,^[9] is to attach a rider to all laws stating that anytime a person violates a law in an act of civil disobedience or conscientious refusal, that person should not be prosecuted for the legal violation. The value of such a proviso is that the government would protect an important form of political or social expression.

Ronald Dworkin^[10] argued that civil disobedience does not necessitate legal action or the drastic legal protection suggested by Bedau. Instead, Dworkin argues, whether an act of civil disobedience should or should not be prosecuted is a matter of prosecutorial discretion. For instance, if the violation of law associated with a particular act of civil disobedience did not harm anyone, then the prosecutor may have good reason to refuse to press the case against the individual who broke the law. In cases that involve harm, be it to persons or institutions, or the destruction of property, the prosecutor may then have a compelling reason to press the case against the individual. It is important to note that Dworkin believes no special actions or arrangements need to be made for cases of civil disobedience, prosecutorial discretion is already a feature of the legal landscape.

Another possibility is to allow a jury to address the problem of civil disobedience. That is, if the jury feels that the defendant was justified in violating the law, then they may acquit, despite the fact that they believe the defendant is genuinely guilty of a violation of

the law. Allowing the jury to decide the issue may include the complication of forcing the courts to allow testimony regarding the defendant's motivations for violating the law as part of the defense, but this should not be an insurmountable problem. Indeed, motives already play an integral role in legal actions. However, within the United States, the legal system has typically sought to limit the extent of jury nullification rather than extend it.

CONCLUSION

While the appropriate legal response to civil disobedience remains a significant problem for scholars and administrators, there can be no doubt that progress has been made in refining its definition and justification. Thoreau provides one of the first sustained discussions of civil disobedience. His argument for one's obligation to violate laws, when those laws contribute to injustices, helped lay the theoretical foundation for a more precise understanding of civil disobedience. Gandhi and King built on this foundation and helped permanently establish non-violence as a necessary component of civil disobedience. Further, Gandhi and King agree with Thoreau that one must accept the consequences for violating the law. However, they differed from Thoreau in that they believe that by accepting the punishment, one reveals a general attitude of fidelity to the law, thus bolstering the moral strength of one's position. The works of Rawls and Dworkin further clarified the definition, but perhaps more importantly, both substantially

clarified possible justifications for, and the role of, civil disobedience within a political system. Yet, it is not the writings but the actions of Thoreau, Gandhi, King, the Clamshell Alliance, the plowshares movement, and others like them that makes clear the important role that civil disobedience can play in addressing injustices within a society.

Civil Service

J. Edward Kellough

*School of Public and International Affairs, University of Georgia,
Athens, Georgia, U.S.A.*

INTRODUCTION

In a general sense, the civil service is comprised of all individuals employed in government, with the exception of those in the military and those who work for the legislature and judicial branches of government. As such, civil service systems exist at every level of government and in every country. Because those who work in the civil service are charged with the responsibility for implementing and managing government operations and programs, the relationship between the civil service and political authorities at the heads of governments has always been of critical importance. Competence, responsiveness, and accountability in the civil service are issues often defined in terms of the context of that relationship. It is expected that public employees will possess the knowledge, skills, and abilities requisite for their positions; that they will be responsive to the public that they serve; and that they will be held accountable to the public and government leaders for their official actions.

THE CIVIL SERVICE SYSTEM

Early in the history of the United States, positions in the civil service were controlled largely by political authorities and were obtained primarily on the basis of political connections. At the federal level, the earliest presidents sought to guarantee that appointments went to people who were capable, but they also preferred people who held political views largely consistent with those advocated within their administrations. Eventually, as political parties became more active and more important nationally, party affiliation became a central criterion for appointment. This system, which became known as political patronage, was defended on the grounds that most jobs in government required little technical skill and that appointment on the basis of political connections would help to ensure responsiveness and accountability to the chief executive. Eventually, however, questions of competence were made subordinate to political considerations, and corruption and inefficiency were common. Patronage practices had given rise to a spoils system in which the offices of government were considered the rightful

plunder of those who were victorious in the electoral process. As the parties alternated in control of the executive branch in the mid-1800s, instability, graft, and the abuse of public authority became common problems.

Significant reform of the spoils system at the federal level began with passage of the Pendleton Act of 1883. The law was passed following the assassination of President James A. Garfield by an individual who had lobbied the Garfield administration unsuccessfully for an appointment in the civil service. Garfield's assassination, along with generally declining fortunes of the Republican party, prompted the Republican majority in Congress to support the Pendleton bill. The legislation, which originally covered only approximately 10% of the federal workforce, specified that employees would obtain their jobs on the basis of their performance on open and competitive examinations designed to measure their abilities to perform the work at issue. Employees covered by the system were also protected from political abuse or removal from office solely for political reasons. As time passed, this approach to public employment, known as the merit system, was extended to cover more than 90% of the federal workforce, and today, most state and local governments have civil service systems similarly staffed on the basis of the merit principle.

Indeed, the prevalence of merit systems for public employment is such that the term civil service is often equated only with those positions filled on the basis of demonstrated ability rather than political connections. Defined in this manner, the civil service is governed by elaborate systems of rules and procedures intended to insulate public employees from undue political influence. For example, in addition to hiring, there are rules governing promotions, transfers, performance appraisal, and compensation. Politically neutral competence on the part of employees and equity or fairness in the manner in which employees are treated within the system are the core values served by the structures of rules and procedures. Obviously, such systems have the effect of constraining managerial discretion or the freedom with which managers may assign and utilize public employees. That is, in fact, the intention behind the array of civil service rules. Some observers, however, argue that greater flexibility

for management is necessary to more effectively and efficiently achieve the purposes of government.

Currently, popular civil service reform proposals are designed to bring about those greater levels of flexibility. Consistent with concepts known as the “new public management,” recent reform initiatives stress reinvention, reengineering, decentralization, and deregulation of the civil service. Advocates for these approaches argue that authority for such key personnel actions within the civil service as selection, promotion, pay, and the classification of jobs should be moved from central personnel offices and placed in the various line agencies, where agency managers will be able to use that authority to better pursue organizational goals and objectives. In this way, human resources functions within the civil service could be better integrated with the planning and management control functions within public organizations. There is also a sense that by placing greater authority for the civil service in the hands of agency heads or directors, who often are political appointees, accountability from the civil service to political authority, especially executive authority, will be enhanced. While that may be the case, there may also be fewer safeguards designed to protect employees and promote equity in the public service. In effect, the great difficulty is to find a way to properly balance the legitimate need for flexibility and political control with appropriate levels of employee protection consistent with the concept of politically neutral competence. The U.S. federal civil service system has been reformed moderately in recent years to allow for greater flexibility in areas such as employee examination and selection procedures, but some state governments have pushed those reforms much further. The state of Georgia, for example, implemented a wide-ranging set of reforms in which authority over personnel policy within the state civil service has been highly decentralized. There is little empirical evidence, however, to demonstrate that the new personnel system is a significant improvement over the more traditional arrangement that had been in place earlier.

CONCLUSION

It is obvious that the civil service performs numerous essential tasks in any society. It is the means by which government services are delivered. One can generally find an extremely wide range of jobs within the civil service, ranging from skilled crafts and trades to engineers, scientists, technicians, and a host of professions from law to medicine. There are also numerous administrators skilled in organizing and managing organizational activities. Certainly, the quality of

public services and even the perceived legitimacy of government are determined in large part by the quality of the civil service and the way in which it operates. Given the range of occupations and complexity, the administration and management of a civil service personnel system is not an easy task. Competent and capable employees must be recruited and selected. Jobs must be classified according to the duties associated with them, and systems of compensation that are fair to employees and competitive with employers in the private sector must be devised. Employee training and development programs must also be implemented. Performance appraisal systems must be established, and policies for employee discipline must also be placed into operation. All of these personnel tasks must be accomplished in an effective manner if the civil service is to function properly.

Civil Service Reform Act of 1978

Jerrell D. Coggburn

*Department of Public Administration, University of Texas at San Antonio,
San Antonio, Texas, U.S.A.*

INTRODUCTION

The Civil Service Reform Act of 1978 (CSRA) is considered a watershed event in the evolution of federal personnel administration. This stems from the fact that it was the first comprehensive civil service reform passed at the federal level since the Pendleton Act of 1883. The CSRA made a number of major structural changes to the federal civil service system and embraced a number of important administrative values. In so doing, the CSRA established the general framework under which federal human resource management is conducted today.

BACKGROUND

The passage of the CSRA in 1978 represented the culmination of decades of growing dissatisfaction with the federal government's personnel system. In the period between the passage of the Pendleton Act—which created the Civil Service Commission (CSC) and a merit-based personnel system for the federal government—and the CSRA, fundamental changes occurred in the scope and size of government. Throughout the twentieth century, the federal government grew in size and complexity as the problems it addressed multiplied and became increasingly intractable (e.g., poverty, civil rights). Predictably, the public began to question government's growth and cost and to associate policy failures with bureaucratic waste, laziness, and ineptitude. Such sentiment was understandable given the public's historic skepticism and distrust of the government, especially in the post-Watergate era.

Perceptions from inside the federal government were equally critical. The Pendleton Act had created a civil service system that promoted merit and politically neutral competence, but such an emphasis was not without consequence. What emerged was a professionalized federal workforce, protected from political coercion, that became resistant to political control. This created tension for presidents and their political appointees who were responsible for government performance but felt unable to control it. Similarly, federal managers felt hampered by restrictive and cumbersome personnel procedures and regulations.

Employees, for their part, felt that they did not receive adequate recognition for their contributions. While a number of reforms were enacted over the years to address problems related to the civil service, they were piecemeal: as particular problems arose, the common approach was to pass legislation or to enact rules in an ad hoc fashion. Over time, however, these reforms served to create a civil service system widely perceived to be ineffective, inefficient, and unresponsive to presidential direction.

So, by the eve of the CSRA's passage, observers could agree upon a number of problems afflicting the federal personnel system, including the CSC's dual and conflicting mission (discussed below); the insularity of civil servants from political direction; excessive administrative procedures; a socially unrepresentative federal bureaucracy; and an inability to reward excellent employee performance.^[1] In order to remedy the civil service's myriad problems, wholesale change was needed.^[2] That wholesale change came in the form of the CSRA, which is generally considered one of President Jimmy Carter's most significant domestic policy achievements.

STRUCTURAL CHANGES

The CSRA included a host of changes to the organizational arrangements for carrying out the federal government's human resource function. Most of these structural changes were achieved through Reorganization Plan Number 2. Though Reorganization Plan Number 2 is not technically a component of the actual CSRA, it established the framework for carrying out the CSRA's provisions, so they are generally discussed as one. The most obvious structural change was the abolition of the CSC. The CSC, created by the Pendleton Act, was a three-member, bipartisan panel that represented an attempt to remove overt political control (i.e., the "spoils") over the federal personnel system. While largely successful in removing political abuses, experience showed that the CSC was pressured by its dual mission of administering the personnel function, including protecting merit principles, and serving as the president's personnel advisor. In its place, the CSRA created several administrative agencies.

Office of Personnel Management

Under the CSRA, the Office of Personnel Management (OPM) became the main personnel management agency of the federal government. Among its mandates, OPM is responsible for making federal personnel policy, advising federal agencies on personnel-related issues, and monitoring compliance with personnel laws and regulations. In contrast to the former CSC's format, OPM is headed by a single director, appointed by and responsible to the president.

Merit Systems Protection Board

The CSRA assigned CSC's role of protecting merit principles to the newly created Merit Systems Protection Board (MSPB). The MSPB is a bipartisan, quasi-judicial entity that carries out its merit protection role by hearing employee appeals and reviewing the government's personnel regulations. Additionally, the MSPB conducts research studies to ensure federal agencies' actions (including those of OPM) comply with merit principles. The MSPB's three members are appointed by the president and serve fixed, 7-year terms.

Office of Special Counsel

Within the MSPB, the CSRA created the Office of Special Counsel (OSC). The CSRA gives the OSC investigative and prosecutorial powers. In other words, the OSC has authority to investigate cases of alleged violation of prohibited personnel practices and to prosecute cases where civil service laws and regulations have been violated. OSC places special emphasis on providing protection to whistleblowers, that is, those federal employees who report violations of law, government mismanagement, or waste. The counsel is appointed by the President, with the Senate's advice and consent, and serves a 5-year term.

Federal Labor Relations Authority

The act also created the Federal Labor Relations Authority (FLRA). The "authority," as it is commonly referred to, is charged with overseeing union-management relationships, including determining bargaining units; certifying bargaining agents; and resolving labor-management impasses through its Federal Service Impasses Panel. The provision creating the authority (Title XII) was not originally contained in the CSRA as presented to Congress, but it was added later during the legislative process. Title XII is significant, because it gives statutory recognition to collective bargaining at the federal level. Prior to the

CSRA, collective bargaining rights for federal employees had only been recognized in presidential executive orders. The three members of the authority are appointed by the president (with senate approval) and serve overlapping 5-year terms.

Senior Executive Service

One of the most significant features of the CSRA was the creation of the Senior Executive Service (SES). The act envisioned the SES to be a cadre of top-tier executives, drawn from the highest levels of the federal service, serving as managerial generalists. In exchange for forgoing some protections they enjoyed under the civil service system, members of the SES are given the opportunity to compete for performance-based pay increases and bonuses (which can be as high as \$20,000), to assume policy-making roles, and to develop their managerial skills through rotating assignments. Rotating assignments are also important from a political standpoint, because presidents and their political appointees (e.g., departmental or agency heads) are given flexibility to move senior career managers to the programs they deem appropriate. The basic idea for the SES is similar to Great Britain's higher civil service model that establishes "rank in the person"—members of the SES retain their rank (pay, status), even if their specific positions change.

VALUES AND CONCEPTS EMBODIED IN THE CSRA

A Foundation of Merit

In addition to the CSRA's major structural changes, the act is important for the administrative values and managerial concepts it embodies. Obviously, the act sought to improve the efficiency and effectiveness of the federal personnel system. These represent classic public administration values and are typically used to sell all sorts of administrative reform, not just civil service reform. But, in addition to these instrumental performance goals, the act reaffirmed the federal government's commitment to a number of important principles, not the least of which is the merit principle.

According to Alan K. Campbell, a chief architect of the CSRA and the first director of OPM, the merit principle was the foundation upon which the entire federal personnel function was to be based.^[2] The drafters of the CSRA considered merit so important that the act codifies a statement of the merit principle at its outset (see [Table 1](#)). Accompanying this delineation was a statement of prohibited personnel practices ([Table 2](#)) which sought to clarify any ambiguity about

Table 1 Merit system principles

- Recruiters should seek to achieve a workforce made up of qualified people from all segments of society, and selection and promotion should be based solely on merit, after fair and open competition.
- All employees and applicants should be treated fairly, without discrimination, and with proper regard for their privacy and constitutional rights.
- Equal pay should be provided for work of equal value, with appropriate consideration for the rates paid by private sector employers. Appropriate incentives and recognition should be provided for excellent performance.
- Employees should maintain high standards of integrity, conduct, and concern for the public interest.
- The federal workforce should be used efficiently and effectively.
- Retention should be based on performance, inadequate performance should be corrected, and employees who cannot or will not improve their performance to meet required standards should be separated.
- Employees should receive effective education and training in order to achieve better organizational and individual performance.
- Employees should be protected against partisan politics and may not use their offices for partisan political purposes.
- When employees legally disclose information evidencing wrongdoing (known as “whistle-blowing”), they should be protected from reprisal.

who (anyone with personnel authority) could be held responsible for what (violating prohibited personnel practices). Together, these provisions underscore the importance of merit as a guiding value in federal personnel under the CSRA.

Executive Control

While the act clearly reaffirmed the federal government’s commitment to merit, it also represented the desire to make the federal bureaucracy more directly accountable to presidential control. The act strengthens such political accountability in a number of ways. For example, making OPM’s director a presidential appointee helps to ensure that federal personnel policy will be responsive to presidential (political) priorities. Also, the structure of the SES, with career members working on a contractual basis in agencies led by presidential appointees, means that the reward and advancement of SES members depend in part on the performance assessments of these political appointees.

Table 2 Summary of prohibited personnel practices

- Discriminating on the basis of race, color, religion, sex, national origin, age, disability, marital status, or political affiliation.
- Soliciting or considering statements concerning a person who is being considered for a personnel action unless the statement is based on personal knowledge and concerns the person’s qualifications and character.
- Coercing the political activity of any person, or taking any action as a reprisal for a person’s refusal to engage in political activity.
- Deceiving or willfully obstructing anyone from competing for employment.
- Influencing anyone to withdraw from competition for any position to help or hurt anyone else’s employment prospects.
- Giving unauthorized preferential treatment to any employee or applicant.
- Nepotism.
- Taking or failing to take, or threatening to take or fail to take, a personnel action because of an individual’s legal disclosure of information evidencing wrongdoing (“whistle-blowing”).
- Taking or failing to take, or threatening to take or fail to take, a personnel action because of an individual’s exercising any appeal, complaint, or grievance right; testifying or lawfully assisting any individual in the exercise of any appeal, complaint, or grievance right; cooperating with or disclosing information to an agency Inspector General or the Special Counsel, or refusing to obey an order that would require the individual to violate a law.
- Discriminating on the basis of personal conduct that does not adversely affect the performance of an employee or applicant or the performance of others, except that an employee or applicant’s conviction of a crime may be taken into account in determining suitability or fitness.
- Taking or failing to take any other personnel action if the act or omission would violate any law, rule, or regulation implementing or directly concerning the merit system principles.
- Violating a veterans’ preference provision in connection with a personnel action (for purposes of disciplinary action only).

Thus, an additional increment of political control is provided by the CSRA.

Social Representation

The CSRA reaffirmed the federal government’s commitment to a socially representative workforce.

This reaffirmation came in various ways. For example, the act explicitly states the federal government's policy of having a workforce reflective of the nation's diversity. Toward that end, the act established a minority recruitment program—the Federal Equal Employment Opportunity Recruitment Program—within OPM. In addition, the CSRA shifted responsibility for enforcing non-discrimination in the federal government to the Equal Employment Opportunity Commission. Finally, the act, as originally submitted to Congress, attempted to significantly curtail veteran's preference by limiting veteran's preference to a one-time, initial hiring preference. This was important, because granting hiring preferences to veterans, the overwhelming majority of whom are male, hampers diversification efforts. This provision, however, was dropped during congressional consideration of the act in favor of less far-reaching limitations.^[3]

Decentralization

The CSRA gives OPM authority to delegate significant areas of responsibility to line agencies within the federal government. In so doing, the CSRA makes a statement about the desirability of personnel decentralization. The delegation and decentralization of examining, for example, is intended to give agencies direct control over determining employee qualifications and hiring, while freeing OPM to devote more of its energies to providing technical assistance to agencies.^[4] In such an arrangement, agency managers have greater flexibility over personnel decisions and can make these decisions more quickly. It also emphasizes a service orientation for OPM instead of a centralized decision-making role.

Whistle-Blower Protection

The CSRA's inclusion of whistle-blower protections embodies at least two administrative values: employee rights and efficiency. Employee rights are bolstered by the OSC's charge to investigate cases of alleged reprisals suffered by whistle-blowers. The intent is to encourage employees to come forward with allegations of waste, mismanagement, and wrongdoing. This, in turn, will improve the efficiency of government, as these costly problems are rooted out.

Private Sector Management

Certain provisions of the CSRA represent the federal government's acceptance of private sector management models. The clearest examples of this are the act's merit pay provisions for mid-level managers

(GS 13–15) and the model of executive compensation created for the SES. Both forms, which rely on individual performance evaluation, seek to increase performance by offering employees financial incentives. The logic used by the CSRA's drafters was simple: if the federal government was to become more efficient, it needed to adopt private sector techniques like performance evaluation and pay for performance.^[5]

Experimentation

Finally, the CSRA provides for personnel experimentation through demonstration projects. Implicitly, this recognizes the inadequacy of synoptic, "one size fits all" approaches to personnel management. By allowing experimentation with novel personnel practices, the CSRA seeks to improve personnel management while reducing the risk of applying reforms or new management practices government-wide prior to discovering their full implications.

APPRAISING THE CSRA

In general, academic treatments of the CSRA's implementation and impact have been unfavorable. At worst, the act has been described as a failure; at best, it has been said to have fallen short of its highest objectives. The act's shortcomings have been tied to its internal contradictions that reflect the tensions its designers faced, including: 1) the desire for decentralization to promote better management versus the desire for centralization to protect merit; 2) the maintenance of control through rules and regulations versus delegating authority and stressing individual accountability; 3) the desire for better management versus political responsiveness; and 4) reorganization of personnel structures to effect positive change versus revitalization of the civil service.^[6] Political and economic factors have also been blamed for the act's failings. For example, implementation of significant pieces of the act occurred during the Reagan Administration. In the throes of economic stagflation, Reagan, who has never been described as a friend of the civil service, focused more on government cutbacks than on achieving the implementation objectives of the CSRA. Thus, the CSRA suffered from design and implementation problems. Specific examples of the act's problems are easy to identify.

First, consider the agencies created by the CSRA. In a survey of federal personnelists conducted by the MSPB, OPM received poor marks in key areas like technical assistance, monitoring and oversight, and policy guidance.^[7] Academic researchers have been equally critical of OPM, noting that it has not

modernized federal personnel management as envisioned by the CSRA and that many of the problems it was intended to remedy persist.^[8] The MSPB and OSC have been criticized for not being aggressive in their efforts to protect merit and, in the case of MSPB, for favoring management in its decisions.^[9] Also, the CSRA's language left unclear the relationship between the OSC and the MSPB. The tensions this created ultimately led to OSC being established as a separate, independent agency by the Ethics Act of 1989. Finally, researchers have given the FLRA credit for the timeliness and impartiality of its decisions but have also pointed out the ineffectual nature of its decisions: FLRA decisions are often overturned upon judicial review.^[10] So, while the CSRA's structural changes have been effected, each of the new agencies has faced its share of operational difficulty.

Second, problems have plagued the SES. Attracted by the lure of advancement and monetary incentives, almost all of those eligible for the SES joined in the first year. Many felt betrayed when, within the year, Congress cut the number of SES members eligible for performance bonuses from 50 to 25%. Rotation in office has also proven to be troublesome. Intended to be a managerial development tool, many in the SES view reassignments as punitive measures. Early on, problems such as these resulted in low morale among SES members, rapid turnover within the SES (more than half of the original members were gone in 3 years), and a majority of SES members saying they would not recommend a career in federal government.^[11] More recently, however, the SES has seen some positive developments. Resentment over pay issues was ameliorated when the Reagan administration lifted salary caps for the SES, and a 1992 MSPB survey^[12] found SES members to have the highest levels of job satisfaction among all government employees. Despite this, most observers agree that the SES is one of the more disappointing aspects of the CSRA.

Finally, several other objectives of the act have achieved disappointing results. Merit pay, for example, has proven to be virtually unworkable in the federal government. The problems, which have been examined extensively by academics (for example, see Ref.^[13]), center on employee perceptions about the fairness of merit pay determinations, the link between performance and pay, and the size of merit pay increases. Recognition of the problems in the merit pay for middle manager system came quickly, as Congress replaced the original system after only 3 years with the Performance Management System. This replacement system faced its own problems and was eliminated in 1993.

The act sought to afford additional protections to whistle-blowers, thus encouraging them to come forth with allegations. This objective has met with mixed success. A report by the MSPB^[14] shows a decrease in

the number of employees who reported witnessing wasteful activities. This would suggest that less waste has occurred over time. The same report shows that the number of employees blowing the whistle when waste was witnessed has increased over time. This again would suggest some success: fewer incidents, but a higher rate of reporting on the incidents that are observed. The problem, however, is that unacceptably high percentages (37%) of whistle-blowers report suffering reprisals for reporting the waste they observed.

The story is similar in the area of adherence to merit principles and prohibited personnel practices. As stated above, the CSRA reaffirmed the merit principle as the foundation for federal personnel management. However, alarmingly high numbers of federal employees report problems with their respective agencies' adherence to merit. For example, one-third of those responding to a 1996 MSPB survey indicated a belief that their agencies regularly fail to uphold merit in hiring and promotions, over one-third indicated their agencies do a poor job of protecting employees from personal favoritism, and one-fourth indicated their agencies do a poor job of ensuring equal pay for equal work.^[15] In the area of equal employment opportunity, the same survey found a significant minority of employees who reported being denied a job or job benefit: 14% reported suffering racial discrimination, 13% reported sexual discrimination, and 11% reported age discrimination.^[16] Findings such as these illustrate the difficulty of ensuring adherence to the most fundamental civil service tenets in a government of approximately 3 million employees.

Finally, experimentation through personnel demonstration projects has not lived up to expectations. This is due in part to limits placed on the number of demonstration projects that can be authorized (no more than 10 at one time), the time-consuming nature of receiving approvals to conduct the projects, and OPM passivity in encouraging agency demonstration projects.^[17] Still, the demonstration projects are not without value. The China Lake Naval demonstration project, for example, experimented with the use of broad banding pay. This approach collapses pay grades into wide pay bands, thereby increasing managerial flexibility in pay administration. The positive results achieved at China Lake have helped to make broad banding a mainstay of contemporary personnel reform proposals. Even here, however, government-wide implementation remains elusive.

CONCLUSION

The CSRA held out the promise of creating a more efficient, effective, and responsive personnel system. Given all that it promised, coupled with the novelty

of many of its reform components—at least as applied to the *public* sector—it is not surprising that the act has not been able to deliver on all fronts. Indeed, the continued interest in reforming the federal civil service (e.g., the Clinton Administration's National Performance Review) attests to the fact that the CSRA was not the success story proponents had hoped for. Despite its shortcomings, the CSRA retains prominence in the public administration field, because it still constitutes the broad framework for federal human resource management.

INTRODUCTION

Civil service reform and reinvention refers to the purposeful modification of governmental human resource management (HRM) systems with the goal of maximizing important administrative values. The particular modifications adopted and the values they manifest vary over time and circumstance.

THE IMPORTANCE OF ADMINISTRATIVE VALUES TO CIVIL SERVICE REFORM

In the most basic terms, civil service systems exist to meet three purposes:^[1]

1. To recruit qualified workers for public sector jobs.
2. To reward and develop the public workforce.
3. To provide rules for the public workforce to meet public objectives.

The simplicity of this depiction, however, masks important tensions inherent to civil service systems. These tensions are often described by academics as resulting from a number of competing administrative values seeking expression (Several authors have discussed the importance of administrative values. For example, see Ref.^[2]). At different points in time, some of these values receive greater emphasis relative to others, and these shifts in emphasis are reflected in the reforms adopted. Because an emphasis on one value can come at the expense of others, there remains continual pressure for reform. Thus, civil service reform has become an enduring feature of the American political system.

David H. Rosenbloom (This discussion of administrative values draws heavily on Ref.^[3]) provided one framework for understanding the values contained in civil service systems. Specifically, Rosenbloom contended that public administration can be understood from three perspectives: managerial, political, and legal. Each perspective is associated with certain administrative values. The following discussion highlights these administrative values within the context

of civil service reform (For complete treatments the history of American civil service reform, see Ref.^[4]).

Political Values

First, the political perspective emphasizes two administrative values: representativeness and responsiveness. Representativeness means that the composition of the civil service should mirror American society. This, in turn, should allow the actions undertaken by administrative agencies to reflect (or “represent”) the will of the majority in the populace. This value has taken on several forms during the history of the civil service. Under George Washington, representativeness took on a geographic connotation because having all regions of the country represented was viewed as a way to insure legitimacy and support for the federal government. Representativeness has also entailed partisan considerations. This was evident in Thomas Jefferson’s efforts to balance the proportions of Republicans and Federalists within the federal bureaucracy so that they reflected the nation’s partisan composition. In more recent times, the value has taken on a demographic tone, which can be seen in governments’ Equal Employment Opportunity and Affirmative Action policies. Despite these variations, the general objective is the same: to have a civil service reflective of the nation.

Responsiveness is the second value associated with the political perspective. In the context of the civil service, this value means having a government that does not thwart the political will of citizens as reflected in their choice of elected officials. Essentially, this means that elected executives should have control over government’s policies and programs and, by necessity, the civil servants who implement them. This value was prominent in the patronage or “spoils” systems that emerged full-blown at the federal level following the election of Andrew Jackson in 1829. Under spoils, newly elected executives fill administrative positions with political supporters, whether they are technically qualified or not. Being supporters, such individuals are likely to be sympathetic (or “responsive”) to the policies of the newly elected. While the most egregious abuses of patronage have virtually vanished due to

various civil service laws and court decisions,^a the desire for responsiveness endures. For example, President Franklin Roosevelt established many “New Deal” agencies outside of the federal civil service system, President Eisenhower created a new category of federal policy-making positions (known as “Schedule C”), with appointees who were exempt from the civil service system’s provisions, while the Carter Administration’s Civil Service Reform Act (CSRA) of 1978 gave presidents power to make political appointments to high-ranking posts within the Senior Executive Service and to appoint the director of the Office of Personnel Management (OPM). In all of these cases, the underlying intent was the same: make the federal bureaucracy (i.e., the civil service) more responsive to presidential direction.

Managerial Values

The second perspective identified by Rosenbloom is the managerial perspective. This perspective emphasizes the values of efficiency, effectiveness, and economy. These values are to be achieved through the apolitical, business-like administration of the human resource (HR) function. As is the case with the values of the political perspective, the importance of managerial values has fluctuated over time. For example, in the late 1800s, the Progressive movement sought to remove rampant partisan abuses from the civil service. Under the spoils approach, it was not uncommon for unqualified workers to be appointed to office and then to use their positions for personal gain. Because new elections brought new rounds of patronage appointments, the activities of governmental agencies also lacked consistency and continuity. The passage of the Pendleton Act in 1883 sought to remedy this by creating a merit-based civil service system. This meant that civil servants were to be selected on the basis of competence—that is, their ability to perform the job as determined by open, competitive exams—and political neutrality. In so doing, qualified persons would be hired (efficiency and effectiveness) in a systematic fashion (efficiency and economy), and much of the abuse would be eliminated (economy). In other words, the Pendleton Act was an attempt to combat

the consequences of the spoils system’s emphasis on political values by establishing a civil service system emphasizing managerial values.

The Pendleton Act did not mark the end of managerial values’ importance to the civil service. Indeed, the desire to take political considerations out of the public HR equation and to make the civil service more “business-like” was a central theme in the evolution of civil service systems during the twentieth century, and it remains a salient feature today. The Classification Acts of 1923 and 1949, for example, established position classification as a key personnel function. Position classification systematically organizes government jobs according to the nature of work done and the knowledge, skills, and abilities required. Ideally, this represents an efficient way to specify what work is to be done, ensure that people doing similar work are treated similarly, establish the basis for reward, and establish career paths for civil servants. The passage of the Hatch Act at the federal level and “Little Hatch Acts” at the subnational level are also indicative of attempts to remove politics from the “administrative” questions of the civil service. In general, the desire to remove politics from civil service decisions and instead to base them on technically efficient, effective processes has been a defining characteristic of the development of recruitment, hiring, compensation, and promotion systems.^[1]

Legal Values

Finally, the legal perspective emphasizes values like employee rights and equity. These values have steadily gained importance in the United States, especially since the demise of the “doctrine of privilege.” This doctrine held that government employment was a privilege—not a right—and that governments could set strict conditions on public employment. Public employees, in turn, “voluntarily” agreed to these restrictions when they accepted a government position. In practice, this meant that civil servants had no recourse when they suffered an adverse personnel action (e.g., being denied a job or promotion, receiving a reprimand or demotion, being separated) for exercising rights they normally enjoyed as citizens (e.g., free speech, freedom of expression, etc.). With the fall of this doctrine by the 1970s, many of the rights and liberties public employees enjoyed as private citizens were extended into the public workplace. So, for example, an employee that blows the whistle on agency wrongdoing can no longer be dismissed for disloyalty; rather, such expression is a protected right.

Due process is another important employee right. In *Board of Regents v. Roth*, the Supreme Court held

^aThe Pendleton Act of 1883 eroded patronage by creating a limited merit system for the federal government. The merit system’s coverage was gradually expanded over time. The Hatch Act of 1939 (as amended) places additional limits on the partisan activities of both public employers and employees. The courts have also played an important role in curbing patronage. Notable cases include *Elrod v. Burns* (1976), *Branti v. Finkel* (1980), and *Rutan v. The Republican Party of Illinois* (1989).

that public employees can establish property interests in their government positions. Since the Constitution, through the fifth and 14th amendments,^b establishes that no person can be denied life, liberty, or *property* without due process of the law, civil service systems at all levels of government had to be modified to afford employees due process. The practical result has been the creation, in many instances, of elaborate employee grievance and appeals procedures designed to ensure the protection of these rights.

Finally, the legal perspective values the equitable treatment of all applicants and employees. In other words, similarly situated applicants or employees should be treated in a similar fashion regardless of their gender, race, age, ethnicity, religious beliefs, or physical abilities. So, for example, when the federal government's Professional and Administrative Career Examination (PACE) was found to have an adverse impact on minority applicants, the federal government was forced by the courts to take remedial action. While PACE represented an attempt to make the selection of entry-level professional and career candidates more efficient (thus, maximizing managerial values), its demise represented the importance of legal values (equity) to the civil service. As a matter of practice, civil service regulations and procedures emphasizing legal values often come at the frustration of managerial values.

Rethinking the Purposes of Civil Service

Returning to the basic purposes mentioned at the outset, the values emphasized in civil service systems have profound effects on how individuals are recruited and selected for government positions (through patronage or competence?), how employees are rewarded and developed (through political loyalty or on-the-job performance?), and how employees are directed toward meeting public objectives (through overt political direction or through elaborate position descriptions?). Thus, the basic purposes of civil service are inextricably linked to managerial, political, and legal purposes and the administrative values they encompass. Since there has yet to be an agreement on what an appropriate balance is among the various administrative values,^[5] there is little question that civil service reform will continue to be a feature of the American political landscape.

^bDue process for federal government employees is established constitutionally by the 5th amendment and statutorily by the Lloyd-LaFollette Act of 1912. Due process for state and local government employees is established constitutionally through the 14th amendment.

THE RECENT FACE OF REFORM: CIVIL SERVICE REINVENTION

Civil service reform has proceeded in an ad hoc fashion in the United States. As particular problems have arisen, the tendency has been to enact laws, rules, and regulations designed to prevent those problems from occurring again. Typically, scant attention has been given to the cumulative effect of adding rules and regulations on top of existing rules and regulations. In many jurisdictions, this has resulted in the creation of rigid, complex, and ineffective civil service systems (For example, see Ref.^[6]). Critics cite a litany of problems to illustrate this, including lengthy and bureaucratic recruitment processes that repel quality applicants; labyrinthine grievance and appeal processes that stifle managers' ability to deal with poor performers; rigid and complex classification and compensation systems that make it difficult to assign work and reward performance; and central HR offices that emphasize regulatory compliance over HR effectiveness.

It is from this general depiction of public sector HR management that the most recent civil service reform efforts have emerged, largely under the broad "reinventing government" banner. The reinvention moniker is a reference to the work of David Osborne and Ted Gaebler, whose 1992 book, *Reinventing Government*, touched off a wave of interest in administrative reform, not just of civil service, at all levels of government. In fact, many aspects of reinvention mirror administrative reform efforts in other parts of the world (for example, in Canada, New Zealand, and Great Britain). Generally, reinvention-type reforms undertaken attempt to dramatically streamline regulatory burdens while simultaneously decentralizing decision-making authority to managers in line agencies. "Let managers manage" is the common rallying cry, reflecting reformers' desire to improve the quality of services government delivers to citizens (or "customers," in reinventing lingo).

Because an effective HR function is intimately related to government's ability to perform, civil service reform has become a prominent feature of reinvention. Among the key civil service reinvention themes are deregulation, decentralization, a shift to a "service" orientation for central HR offices, and privatization.

Deregulation

In attempting to combat the abuses and corruption associated with patronage, civil service systems developed rules and procedures that emphasized merit and neutral competence. While largely successful in battling problems associated with patronage,

proponents of reinvention argue that this has come at a significant cost to managerial flexibility and, ultimately, government performance. Thus, deregulation entails removing administrative rules and procedural requirements that are thought to impede performance. Deregulation can affect almost every aspect of HRM. For example, in the area of recruitment and selection, deregulation might include eliminating requirements for all job applicants in a given jurisdiction to use the same standardized application or to take a written exam. Instead, applicants might be allowed to submit résumés containing information more directly related to the jobs they are applying for. Similarly, deregulation can come into play in employee discipline and termination. As mentioned above, managers often feel constrained by the inability to effectively deal with poor performers or non-performers. Streamlining (i.e., “deregulating”) grievance and appeals procedures by consolidating reviews and relaxing management’s evidentiary burdens attempts to balance employees’ due process rights with government’s desire to effect employment actions in a timely, efficient fashion. Finally, in compensation, deregulation might provide agency managers the freedom to set or adjust employee pay within broad pay bands based upon prevailing market wages and an employee’s skill and on-the-job performance (this, as opposed to rigid classification-based pay schedules and step increases). As these examples show, deregulation attempts to remove “red tape” that is thought to undermine HR management effectiveness and efficiency.

Decentralization

Decentralization is another aspect of reinvention. It entails parceling out authority and discretion over many important HR functions from central HR offices to managers in line agencies. The basic idea is to empower managers responsible for producing programmatic results by giving them more control over HR management. For example, decentralizing hiring authority to agencies allows managers to formulate job criteria, control the evaluation of applicants, and hire qualified individuals. The rationale for this is straightforward: managers in line agencies have greater technical knowledge about their vacant positions than personnelists working in central HR offices; thus, they are in a better position to ensure the recruitment and selection process results in hires that meet their respective agencies’ needs. Moreover, placing HR management authority in the hands of the agencies actually doing the hiring, promoting, training, etc., expedites these processes. In general, a decentralization strategy

seeks to increase managerial authority over HR management, thereby enabling managers to utilize it as an effective performance improvement tool.

Service Orientation

This aspect of reinvention is directly related to the preceding two. Traditionally, central HR offices assumed responsibility for creating HR policy, administering various HR functions (e.g., classification, competitive exams, training, and development), and for ensuring regulatory compliance through agency oversight. Proponents of reinvention argue that these central “counterbureaucracies,” as they are sometimes called, have the tendency to act as “guardians” of the merit principle and the merit system. From the reinvention standpoint, this represents a form of “goal displacement,” in that the true goals of the civil service system (e.g., attracting and retaining the most qualified workforce) are obscured by an overemphasis on ensuring adherence to rules. In contrast, a service orientation would have central HR offices focus on providing assistance and advice to line agencies, as these agencies assumed increased responsibilities for the day-to-day management of HR functions within a decentralized, deregulated environment.

Privatization

A final aspect of reinventing the civil service is privatization. While there are many varieties of privatization, a common approach is for government to contractually “outsource” services to non-profit or private (for-profit) organizations. In other words, government makes a provision for some “public” service or good, but the actual production is left to a contracted entity. Free of the civil service’s regulatory burdens and armed with the ability to design service delivery, private contractors are thought to be able to provide better services at lower costs. Importantly, privatizing also sends the politically symbolic message that big government—as exemplified by the number of civil servants—is being cut. Privatization of public services like prisons and solid waste collection has been around for decades. Importantly, however, privatization is not isolated to programmatic areas. Indeed, traditional HR functions like payroll and benefits administration, workforce training and development, employee assistance programs, and employment testing have been targeted for privatization. Proponents argue that outsourcing these “housekeeping” activities frees HR offices to focus on their strategic and advisory roles.

CONTEMPORARY EXAMPLES OF REFORM AND REINVENTION

Recent examples of civil service reinvention are plentiful. At the federal level, reinvention activities were initiated under the Clinton Administration's National Performance Review (NPR). In *Reinventing Human Resource Management*, a report that accompanied the original NPR, the administration specified a number of goals for federal HR management (Table 1).

Table 1 Reinventing Human Resource Management Under the National Performance Review

Enable managers to create and maintain a quality, diverse workforce.

- Create a flexible and responsive hiring system.
- Reform the general schedule classification and basic pay system.

Enable managers to empower, develop, train, reward, and discipline employees.

- Authorize agencies to develop programs for improvement of individual and organizational performance.
- Authorize agencies to develop incentive reward and bonus systems to improve individual and organizational performance.
- Strengthen systems to support management in dealing with poor Performers.
- Clearly define the objective of training as the improvement of individual and organizational performance; make training more market driven.

Enable employees to manage work and family responsibilities.

- Enhance programs to provide family-friendly workplaces.

Hold managers accountable for adherence to principles of merit and equal opportunity.

- Improve process and procedures established to provide workplace due process for employees.
- Improve accountability for Equal Employment Opportunity goals and accomplishments.
- Improve interagency collaboration and cross-training of human resource professionals.

Create a system that is self-renewing and continually improving.

- Strengthen the Senior Executive Service so that it becomes a key element in the government-wide culture change effort.
- Eliminate excessive red tape and automate functions and information.
- Form labor-management partnerships for success.
- Provide incentives to encourage voluntary separations

Source: National Performance Review. *Reinventing Human Resource Management*; Accompanying Report of the National Performance Review. National Performance Review: Washington, DC, 1993.

The NPR recommended a variety of specific initiatives designed to accomplish these broad reinvention objectives. In many instances, these recommendations were followed. For example, the NPR resulted in several instances of deregulation. The most visible was the elimination of the *Federal Personnel Manual*: the administration went so far as to use a wheelbarrow to ceremoniously discard it in a dumpster.^[7] In another example of deregulation, the OPM also eliminated the requirement for all federal agencies to use a standard application form (the form is known as SF-171). The NPR also accomplished decentralization—as of 1998, virtually all of the federal government's hiring authority has been decentralized to line agencies.^[8]

An important question is whether the reinvention reforms initiated by the Clinton Administration will last under the administration of George W. Bush. There is early evidence that many broad reinvention themes will, in fact, be continued. In the *President's Management Agenda*, for example, President George W. Bush calls for the flattening of agencies to make them “citizen centered,” for the contracting out of “commercial positions,” and for agencies to more fully utilize the existing HR flexibilities already available. Additionally, the administration will be searching for other ways “to enhance management flexibility, permit more performance-oriented compensation, correct skills imbalances, and provide other tools to recruit, retain, and reward a high quality workforce.”^[9]

Not all reinvention activity—or perhaps even the most impressive—has occurred at the federal level. The most far-reaching, perhaps radical,^[10] reinvention has occurred at the state level. Georgia is the prime example. In 1996, under the direction of then Governor Zell Miller, the state effectively eliminated its traditional merit system. The justification for this change was classic reinvention. According to Miller, the state's merit system was outdated, overregulated, and provided cover for bad workers instead of rewarding good workers (As quoted in, see Ref.^[11]). The reform adopted, Act 816, contained deregulation and decentralization components aimed at speeding hiring and disciplinary processes, providing agency managers greater HR flexibility, and reorienting the state HR office to an advisory and service role. The initial impacts are only beginning to surface, and they appear mixed. For example, there is some evidence that deregulation and decentralization have allowed cronyism and favoritism to creep back into the state's HR functions, and while most state workers in Georgia agree that the reforms have expedited certain HR processes, most do not perceive an increase in overall HR effectiveness (see Ref.^[12]).

Wisconsin is another state that has been widely recognized for recent civil service reforms. Responding to many of the same frustrations as Georgia, Wisconsin

undertook a number of civil service reforms during the 1990s. Under the direction of Robert Lavigna, the state's merit system administrator at the time, Wisconsin instituted a number of reforms intended to improve the state's HR function. Examples include decentralizing HR authority, establishing walk-in testing procedures for some administrative positions, and creating an on-line jobs bulletin service. The state also created two specialized recruitment programs: the Critical Recruitment Program and Entry Professional Program. The Critical Recruitment Program gives agencies the flexibility to quickly hire workers in competitive areas like engineering and health care. Similarly, the Entry Professional Program eschews traditional written exams in favor of more flexible recruitment techniques so that qualified college graduates can be recruited and hired more quickly. These reforms, which incorporate reinvention themes like decentralization and deregulation, appear to have improved the civil service system in the state. Specifically, the state reports that hiring is more timely, applicant pools are better qualified, workforce diversity has improved, and HR costs have decreased (These reforms and their outcomes are described in Ref.^[13]).

Most recently, the state of Florida announced its intention to privatize major portions of its HR function. In September 2001, the state issued an "intent to award" for a \$40 million per year contract with a private firm, Convergys, Inc. The scope of work to be performed by the contractor, as indicated in the invitation for bids issued by the state, is broad. Included are many transactional processes like advertising vacancies, assisting in employee training and development, collecting time sheets, processing new appointments, administering payroll and benefit systems, and maintaining employee personnel records.^[14] Obviously, shifting these functions to a private sector provider represents a large-scale HR experiment. The rationale for conducting it is economical and political. Economically, the state figures that it can save the \$80 million needed to update its antiquated personnel computer system, plus an estimated \$25 million per year in personnel salaries over the 5- to 7-year life of the contract. Politically, privatizing HR represents the priorities of Governor Jeb Bush, who ran on the pledge to make Florida's government "leaner." It is worth noting that the state plans to maintain control over critical areas like employee selection, discipline, grievances, and collective bargaining. Still, the scope of the proposed outsourcing is enormous.

CHALLENGES OF REINVENTED CIVIL SERVICE

The direction that civil service reform and reinvention has taken in recent years, as exemplified above, leads

to a number of important challenges. Among these are ensuring that the requisite HR management knowledge, skills, and abilities are present in central HR offices and line agencies; addressing equity issues associated with the removal of standard, centralized HR processes; and preventing the potential political abuses from materializing. How these challenges are addressed will be telling to the next, perhaps inevitable, wave of civil service reform.

HR Management Expertise

First, a decentralized personnel system means that expertise formerly found in central HR offices must now be disseminated throughout the line agencies of government. Managers and HR generalists in these agencies must possess the knowledge, skills, and abilities needed to effectively and legally assume a range of HR responsibilities, potentially including recruitment, selection, performance appraisal, classification, compensation, and training. Some solace is offered by reinvention's call to have central HR offices move to consultative roles in which they offer advice and assistance to line agencies. This, however, entails new knowledge, skills, and abilities on the part of those in central HR agencies, for example, they need to become skilled consultants with a breadth of HR knowledge as opposed to specialized personnel experts. If either of these necessities fails to materialize, then the effectiveness, efficiency, and perhaps legality of public HR management practices may be called into question.

Equity

A second major concern related to civil service reinvention is equity. Traditionally, a primary responsibility of central HR offices has been to ensure equity. Examples include ensuring open competitive exams, classification and compensation systems that award equal pay for equal work, and consistent procedures for employee grievances. When control is decentralized and the processes are deregulated, there remains a real possibility that similar cases will be treated in a dissimilar fashion. Such a possibility has been raised by many in the public administration community who warn that public employees have come to expect equitable treatment (See for example, Ref.^[15]) if civil servants experience disparate treatment as a result of where (i.e., which agency) or for whom (i.e., which manager) they work, then there will likely be a backlash that favors the reassertion of standardized, centralized controls. In other words, managerial flexibility may run into renewed demands for equity.

Politics

Finally, reinvention has to contend with the “politics problem” (For example, see Ref.^[16]). By removing HR rules and regulations and by decentralizing authority, a reinvented civil service is one that is more open to political and partisan abuses. As mentioned above, the historical development of the civil service placed a premium on combating such problems. When rules are relaxed or eliminated and when HR authority is decentralized, there is a greater likelihood that political officials will use their positions of control and influence to reward friends and political supporters. If and when such political favoritism or cronyism occurs, the result will likely be new calls for reform—reforms that echo traditional antipatronage themes. It is important to recall, however, that not all civil service protections are embodied in civil service laws and regulations. Indeed, the courts have placed severe limits on the ability of government officials to “clean house” on purely political grounds. Similarly, widespread fixation on government performance means that political figures have an incentive to use their HR authority to hire competent individuals who can help government “do more for less.” Still, the possibilities of political intrusions into HR decision making raise the chances that reinvention will encounter difficulties.

CONCLUSION: MORE REFORM AND REINVENTION

Any description of civil service reform and reinvention must be viewed as prologue. Indeed, civil service reform has become “virtually a national pastime.”^[17] At this point, it is difficult to say what the full effects of civil service reinvention will be, as it will take many more years, perhaps decades, for them to materialize. However, a dynamic environment, influenced by shifting political, economic, and social forces, virtually ensures that the nature of civil service’s problems will fluctuate, as will the administrative values civil service systems emphasize.

Collaborative Governance

David E. Booher

*Center for Collaborative Policy, California State University Sacramento,
Davis, California, U.S.A.*

INTRODUCTION

Collaborative governance refers to practices that engage stakeholders, citizens, and public agencies in joint deliberations on policy decisions. Collaborative governance has special features that distinguish it from traditional government. At least five examples can be identified from many substantive fields of public policy such as environment, health, and city planning. These include consensus building, community visioning, negotiated rule making, network structures, and public involvement. Implementation of collaborative governance presents problems because of the differences between collaborative governance and traditional governance. Hence, collaborative governance often emerges as an adjunct to policy making by government agencies. Scholars believe that collaborative governance practices have emerged in response to contemporary conditions that affect policy making. The future for collaborative governance depends upon the development of theory and the pursuit of more research.

FEATURES OF COLLABORATIVE GOVERNANCE

Collaborative governance has at least five special features as summarized in [Table 1](#).

Collaborative governance ideally includes the full array of legitimate stakeholders concerned about the policy issue who recognize their interdependence in finding solutions. The process is self-organizing, with the participants setting their own ground rules, agenda, and decision-making rules. Participant deliberations are unconstrained by the convener and the status quo, and all assumptions can be challenged. The dialogue is carefully managed to ensure that all are heard and respected. The participants engage in joint fact finding. Finally, the task is meaningful to the participants and there is clarity about how decisions will be implemented.

Differences between traditional governance and collaborative governance can be highlighted for 11 key dimensions, as summarized in [Table 2](#). These differences create the issues for the implementation of collaborative governance that are discussed below.

EXAMPLES OF COLLABORATIVE GOVERNANCE PRACTICE

There are at least five examples of collaborative governance practice in wide use today: consensus building, community visioning, negotiated rule making, network structures, and public involvement.^[1]

Each of these examples typically occurs in different stages of the policy process as illustrated in [Fig. 1](#). Collaborative public involvement is used to inform policy analysis. Consensus building and visioning often are used to formulate policy for implementation by public agencies. Negotiated rule making and network structures are often used to implement policy. However, in some cases, deliberations in network structures may lead to the formulation of policy, as organizations find that they must seek changes to policy for effective implementation.

Consensus building brings all relevant stakeholders together to seek agreements regarding specific public policy issues in situations where traditional governments have been unable to craft solutions, resulting in a stalemate. These processes are often convened by affected public agencies.^[2] Once agreement has been reached, the consensus building process may end, and implementation may be turned over to traditional institutions. However, stakeholders often monitor implementation and respond to changed conditions. For example, they may transform into another example of collaborative governance, such as a network structure.

Community visioning is a process whereby members of a community build consensus on a description of the community's desired future and on actions to help create goals for the future reality.^[3] This process is usually followed by the organization of working groups to carry out specific steps and to monitor implementation of results. Similar to consensus building, a community visioning process may be transformed into a network structure.

Negotiated rule making is a process in the United States whereby a regulatory agency brings stakeholders together to engage in negotiation with each other and with regulatory agencies regarding the promulgation of a new regulation.^[4] If an agreement is achieved, the regulatory agency then carries out

Table 1 Features of collaborative governance

Features	Summary description
Participants	Full diversity of legitimate stakeholder representatives related to the issue and dependent on other stakeholders for resolution
Process	Self organizing with participants setting ground rules, agenda, and decision rules
Deliberations	Unconstrained by convener. Status quo and all assumptions can be challenged. Dialogue focuses on interests and the problem, not positions and avoids ad hominine attacks. Dialogue is managed to assure all are heard and discourse is sincere, accurate, and comprehensible
Information	Joint fact finding with all information accessible and fully shared among participants
Task	Meaningful to participants with clarity about how decisions will be implemented

the approval of the new regulation through the traditional process. Negotiated rule making is especially common for environmental regulation. The U.S. Environmental Protection Agency (EPA) has been using negotiated rule making since the 1980s, and in 1990, two new federal laws, the Negotiated Rulemaking Act and the Administrative Dispute Resolution Act, were enacted to enable these processes.

Network structure refers to a configuration that brings together affected parties, often including both government agencies and NGOs, to work together to address an ongoing problem or issue of mutual concern that they cannot individually address.^[5] A network structure is not focused on reaching agreement on a specific policy dispute, but rather seeks to build capacity to accomplish shared goals. In this way, a network structure goes beyond mere communication and coordination. The participants take part in a new entity, taking on activities that are more than the simultaneous tasks of independently operating organizations. They have a common mission, collaboration

norms, and a unique structural arrangement that is often provided for in a memorandum of agreement.

Public involvement refers to the processes for engaging the public in policy decision making that go beyond traditional processes of notice, comment, and public hearings typical in the United States.^[6] It facilitates dialogue among the public and with decision makers about options for policy, and it ensures follow up to keep the public informed about the final decision and how the decision has been influenced by the involvement.

Collaborative governance typically proceeds through a series of four steps, as summarized in Table 3. Although these steps occur sequentially, it is not uncommon for the steps to be recursive. For example, upon entering into deliberation, participants may discover that additional stakeholders must be involved, causing them to revisit the organization step. Or, during deliberation, they may discover that more information is needed, and thus return to the analysis step. Likewise, during implementation, new conditions

Table 2 Comparison of traditional governance and collaborative governance

Governance dimension	Traditional governance	Collaborative governance
Structure	Hierarchical	Networks
Source of direction	Central control	Coordination
Goals	Clear with defined problems	Various and changing goals and problems
Origin of system behavior	Determined by roles of participants	Determined by relational interactions of participants
Role of manager	Organization controller	Mediator, process manager
Managerial tasks	Planning & guiding organization process	Guiding interactions, providing opportunities
Managerial activities	Planning, designing, and leading	Engaging participants and resources, influencing conditions
Leadership style	Directive	Generative
Criteria for success	Attainment of the goals of formal policy	Realization of collective action
Organizational context	Single authority	Multiple authorities
Source of democratic legitimacy	Representative democracy	Deliberative democracy

Fig. 1 Location of collaborative governance examples in policy process stages.

may emerge that require returning to the deliberation step. In addition, each context for collaborative governance is unique, and hence, specific activities may vary to reflect the situation.

IMPLEMENTATION OF COLLABORATIVE GOVERNANCE

As shown in Table 2, collaborative governance requires different structures, ideas about goals and the determination of system behavior, managerial functions, leadership styles, and organizational context than traditional governance. Collaborative governance may also imply a different ideal for the source of democratic legitimacy than traditional governance. These differences may create tensions between the practices of traditional governance and collaborative governance. Therefore, the most prevalent obstacle to implementation of collaborative governance is the way the existing institutional context is structured around adversarial methods for collective decision making. Collaborative governance often conflicts with

the political and bureaucratic styles that define much public policy practice.^[7] Moreover, collaborative governance requires a willingness to transcend traditional debates about agency discretion and to experiment with nontraditional forms of accountability.^[8]

As a result, collaborative governance practices are often created as an adjunct to public agencies. For example, consensus building and visioning are sponsored by public agencies seeking to formulate policy that will be widely agreed to by stakeholders and citizens. Participants may find that, to be successful, they must work with both the different features of collaborative governance and the traditional features of public agencies.

Another important obstacle to implementation of collaborative governance is presented by activists who argue that significant injustices and social harms exist in society that must be confronted by adversarial activism. These activists fear that collaboration may prevent this confrontation if processes are not inclusive, or they set unacceptable constraints on the terms of collaboration. They also argue that participants are influenced by a common societal discourse based on a product of structural inequality.^[9] As a result, some activists may be reluctant to participate in collaborative governance.

Collaborative governance has been shown to have outcomes such as creating innovative policies, eliminating stalemates, and producing political, social, and intellectual capital that enable future problem solving.^[10] Participants often report satisfaction from the processes and the expectation that they will use such processes in the future.

Finally, collaborative governance is not appropriate for all policy making. For example, for issues in which there is little complexity, interdependence, or uncertainty or for issues in which the goals and the authority to act are clear, traditional governance may be more effective and efficient. In addition, the features of collaborative governance are critical to achieving the outcomes promised. Failure to involve all stakeholders in a self-organizing process of deliberation and joint fact finding may produce few or even undesirable

Table 3 Steps for a collaborative governance process

Step	Typical activities
Organization	Assess whether collaboration is appropriate. Engage stakeholders or public. Design process. Provide resources
Analysis	Develop mutual understanding of concerns and issues. Develop common information base. Agree on issues to be addressed in deliberations
Deliberations	Agree on problem(s). Generate alternatives. Develop evaluation criteria and evaluate alternatives with criteria. Decide on alternative(s) to recommend or pursue
Implementation	Identify tasks and responsibilities to implement decisions. Determine methods to monitor results and respond to changed conditions

outcomes and increase public cynicism, and may be seen as cooptation.^[11]

WHY IS COLLABORATIVE GOVERNANCE EMERGING?

Scholars have argued that five societal conditions for contemporary policy are important to understanding the emergence of collaborative governance.^[12] First, new spaces are being created for governance. In this spatial metaphor, traditional government institutions, with their specific jurisdictions for policy issues and geography, are seen as spaces in which policy making historically occurs. Today, these spaces are being augmented by configurations of multilevel governance among these institutions and between the institutions and non-governmental organizations (NGOs). Collaborative governance is a practice that occurs in these new spaces in interstices among traditional agencies.

Second, the complexity and rapid change of contemporary society have created an increasing awareness among the public of the limits to centralized hierarchical control by government agencies guided by expertise.^[13] This awareness leads to more uncertainty about policy and a focus on the importance of managing that uncertainty. Collaborative governance may be one strategy to manage uncertainty because it emphasizes joint responsibility, continuous learning, adaptation, and shared capacity for future problem solving in the face of changed circumstances.

Third, society has become more culturally diverse. Solutions to public policy problems require decision makers to deal with an array of publics with different languages, values, perspectives, cognitive styles, and world views. Collaborative governance responds to this challenge by including all relevant publics and by creating processes in which dialogue and deliberation can lead to mutual understanding.

Fourth, officials and the public are increasingly aware of interdependence in policy making as agencies find that they cannot be successful by working unilaterally. While diversity poses challenges to communication and understanding, interdependence creates the need to overcome these challenges. Collaborative governance focuses on interdependence by creating the capacity to interact, share power, and find shared problem definitions and paths to solutions.

Finally, arising out of all of these is the issue of the changing dynamics of trust. Trust in traditional government originates from the legitimacy of constitutional institutions. In the context of new spaces, uncertainty, diversity, and interdependence, this trust can no longer be assumed. Leaders and the public find that, to work across boundaries and across different values and cultures in the face of continuous change,

they must find additional means to engender trust and solve shared problems. Collaborative governance supports proceeding independent of trust and has been shown to engender trust among its participants.^[14]

THE FUTURE OF COLLABORATIVE GOVERNANCE

A central issue for the future of collaborative governance is the need for development of theory and related research. The practice of collaborative governance has evolved without a robust theory. Scholars of many disciplines from around the world are now giving it careful attention. For example, 50 scholars recently published an open call to their colleagues to extend and enhance teaching and research related to collaborative governance because of its importance to the future of democracy.^[15]

A robust theory would provide: (1) the basis for anticipating the probability that collaborative governance might emerge or be appropriate in specific policy contexts; (2) the basis for the design of new institutional forms that incorporate collaborative governance; (3) a framework to evaluate specific collaborative governance methods for specific situations; and (4) a framework to analyze existing research and to design future research for empirical testing.

A theory of collaborative governance needs to address: (1) the conditions when collaborative governance is appropriate in contrast to the conditions when traditional governance is appropriate; (2) the justification for the democratic legitimacy of collaborative governance; (3) the appropriate methods for effective use; and (4) the interaction of collaborative governance with traditional governance.

Some of the areas for future research include representation and equality in collaborative governance processes, impact on policy outcomes, accountability, and paths to institutionalization.

Collective Bargaining

Robert Hebdon

Faculty of Management, McGill University, Montreal, Québec, Canada

INTRODUCTION

By permitting the formation and legal representation of unions or associations, collective bargaining processes reconcile the competing interests of managers and employees in the workplace. The potential for conflict exists in both private and public sectors—not only over economic issues but also the control of work processes. A third element of collective bargaining in a North American context is the institutionalization of disputes over disciplinary practices and the interpretation of collective bargaining agreements signed by management and unions. Thus, the goals of collective bargaining are to provide orderly and peaceful mechanisms for the resolution of disputes between management and labor over the distribution of economic rewards, the control over work processes, and the interpretation and application of collective bargaining agreements.

SCOPE

By the year 2000, over 37% of the U.S. public sector workforce were members of unions or employee associations. Collective bargaining had become entrenched as a mechanism for providing employee voice in public sector establishments at the local, state, and federal levels. Not all states, however, have collective bargaining laws. Twenty-four states have comprehensive laws that impose a “duty to bargain” on public employers for all public employees—state, teacher, police, fire, and other municipal employees (Table 1). At the other extreme, there are 11 states that have no duty to bargain in the law and five states that have no law at all (Arkansas, Colorado, Louisiana, Missouri, and West Virginia).

Differences Between Public and Private Sector Collective Bargaining

It is widely believed that the private sector model of collective bargaining is inappropriate for the public sector. Consequently, numerous important differences have emerged in the laws that govern two bargaining systems.

Scope of bargaining

Generally, public employee unions are more restricted in the scope of negotiable issues than their private sector counterparts. For example, employees of the federal government cannot bargain over wages or benefits. In the public sector, management’s rights are more broadly defined to include matters of public policy.

Economic context

To some extent, public sector bargaining is insulated from the same market forces that exist in the private sector. By definition, such public goods as public health and safety are offered in a less competitive environment than in the private sector. Although the monopoly of services was seen as a bargaining advantage by public employee unions, particularly in the early years, fiscal conservatism and the privatization threat have eliminated any such advantage.

The right to strike

Unlike private sector collective bargaining, most public employee unions do not have a legal right to strike. As a matter of public policy, the services that public employees provide are viewed as too essential to permit disruptions. Strikes may threaten the health and safety of the public. Even in states where public sector strikes are legal (e.g., Pennsylvania), strikes may be stopped by injunction if they pose a threat to the health and safety of the public.

Four Decades of Bargaining

Since the 1960s, collective bargaining has gone through four distinct phases roughly corresponding to the four decades since then. The first generation represented the growth phase of employment and unions of the 1960s, the second was characterized by the taxpayer revolts of the 1970s, and the third generation in the 1980s involved greater emphasis on the performance and productivity of public services.^[1] In what may be described as a period of heightened aggression against public sector collective bargaining, the 1990s represented the fourth generation of public sector collective bargaining.^[2] Since 1990, public employees have been

increasingly under attack on the related fronts of job security and compensation through privatization and challenges to collective bargaining rights.

Dispute Resolution Procedures

Given that a primary goal of collective bargaining is the peaceful resolution of disputes between management and labor, we examine the evolution of dispute resolution procedures. Most public sector dispute resolution mechanisms were designed over 20 years ago to avoid strikes. The belief was that essential public employees simply could not be allowed to walk off their jobs because of the irreparable harm that might be done to the public and because “excessive” union bargaining power would result in huge wage gains in negotiations. This provided the rationale for extensive intrusions into the collective bargaining process in the public sector, in contrast to the voluntarism of private sector dispute resolution. The result was the current North American legislative patchwork of arbitration,^a fact finding,^b and compulsory mediation^c (Table 2).

In recent years, public sector strikes have declined and new issues of concern have emerged, associated with such factors as wage freezes, layoffs, restructuring, contingent workers, privatization, and employee benefits. In this new environment, it is not surprising that policy makers are reassessing the necessity of these intrusive procedures that focus on avoiding the strike

^aInterest or “contract” arbitration involves the establishment of agreement provisions by a third party; grievance or “rights” arbitration deals with matters of contract interpretation during the life of the agreement.

^bAs the name implies, fact finding is a process that normally involves a formal hearing with briefs and evidence in support of the parties’ positions, followed by a written public report in which the fact finder makes a non-binding recommendation on each issue in dispute. Interest arbitration differs mainly in the private and binding nature of the arbitrator’s (or board’s) award.

^cCompulsory mediation is usually an intermediate stage where a neutral third party acts as an informal facilitator. Unlike its private sector counterpart, it is often a compulsory step in the public sector.

Mediation	5	9	9	9
Fact finding	6	13	19	15
Arbitration	22	5	8	6

Source: From Ref.^[6].

outcomes, not the process for dealing with these new issues. It is entirely possible that both fact finding and arbitration will come under even more scrutiny as their costs and benefits are reevaluated. Public sector dispute resolution procedures are at the center of the assault on public sector bargaining. An important issue, for example, is the extent to which interest arbitration (a dispute resolution procedure adopted when the focus was on prohibiting strikes) is appropriate to the current environment, when the focus is on retrenchment and restructuring.

Recent Trends

Dispute resolution in the public sector adapted to meet the more extreme economic, political, and financial environment of the 1990s. Intensifying fiscal pressures and more conservative political forces combined to create the apparent need for major cost reductions and/or layoffs in many jurisdictions. Paradoxically, this crisis atmosphere created a unique opportunity for labor and management to experiment with cooperative approaches to dispute resolution. Experiments in “interest-based bargaining”^d abound at federal, state, and local levels of government covering a wide range of occupations from blue-collar municipal employees in Wisconsin to clerical and administrative employees in the Federal Department of Labor. In Wisconsin, for example, the Wisconsin Employment Relations Commission (WERC) now offers training to the parties in “consensus bargaining,” a problem-solving approach to negotiations and dispute resolution. The WERC^[3] reported that it trained 25 sets of municipal negotiators (over 525 persons) in this new approach. Interest-based and problem-solving bargaining has also been employed in bargaining at the federal level. For example, the Labor Department and the American Federation of Government Employees negotiated two “major agreements” using a win-win approach (Ref.^[4], p. 506; Ref.^[5], p. 5). Probably the most pervasive

^dInterest-based bargaining, which has many variants (win-win, principled, consensus, mutual gains, cooperative, etc.), attempts to replace the adversarial negotiations that often accompanies collective bargaining with a more cooperative or integrative approach that emphasizes the common concerns of management and labor.

changes in collective bargaining are occurring as a result of reform of the U.S. educational system. As teachers become increasingly involved in educational policy making, more cooperative approaches to bargaining are beginning to appear, although research indicates that this has not spelled the end of adversarial bargaining.

Although numerous strikes has remained low after the steep decline of the early 1980s, other forms of conflict such as grievance arbitrations and unfair labor practices have steadily increased in some jurisdictions. To meet this new challenge, public sector agencies have institutionalized new forms of mediation, particularly grievance mediation.^e

The courts continue to play an inconsistent but important role in shaping dispute resolution procedures Lund and Maranto.^[6] The right to strike has been extended by decisions of state supreme courts to all public employees in Louisiana (1990) and Colorado (1992), but denied in common law to public employees in West Virginia (1990). In addition, interest arbitration awards have been reviewed in the supreme courts of Iowa (1992) and New Jersey (1993), and a binding interest arbitration law was found to be unconstitutional by Nebraska's supreme court (1991).

The antigovernment mood has placed public sector collective bargaining under severe scrutiny. What appeared just a few years ago as acceptable dispute resolution methods are increasingly under assault from taxpayers, employers, and politicians. For example, the utility of interest arbitration is being questioned in Wisconsin, Iowa, New Jersey, and New York. For both fact-finding and interest arbitration, the debate focuses on the appropriate weight to be attached to the criteria of taxpayer concerns and ability to pay.

This reassessment of dispute resolution procedures comes after two or three decades of experience in many states.

CONCLUSION

Despite the challenges of public sector collective bargaining since the 1960s, it remains a popular mechanism for providing employees voice in the workplace. After the growth period in the 1960s, close to 40% of public service employees at the local, state, and federal levels of government are covered by collective bargaining.

^eUnfair labor practices refer to complaints to a labor relations administrative agency (e.g., the National Labor Relations Board), either by a union or employer over such matters as bargaining in bad faith or interference and/or coercion in the organizing process. Grievance mediation represents the application of voluntary mediation techniques to grievance disputes as an intermediate step before formal binding arbitration.

Collective Bargaining, The Politics of

Robert Hebdon

Faculty of Management, McGill University, Montreal, Québec, Canada

INTRODUCTION

A concern in the early period of public sector bargaining (1960 to early 1970s) was that public employee unions may have too much power, particularly political power vis-à-vis weaker interest groups.^[1] Subsequent evidence, however, has not supported this fear. Most research has shown that union-non-union wage differentials, for example, are greater in the private sector than the public sector (see Ref.^[2]). Nonetheless, public employee unions have exercised their right to engage in various political activities to significantly increase wages, employment levels, and departmental budgets (summarized in Ref.^[3]; see also Ref.^[4]).

Three broad questions have been the focus of early exploratory research into union political activities in the public sector. The few studies that are available examined the types of political activities at the municipal level and the considerable occupational and union variation. Second, studies examined the factors that explain the variation in type and level of political activity. Finally, some research analyzed the relationship of political action to collective bargaining. For example, do public sector unions compensate for weak bargaining laws by engaging in political action?

After reviewing some theoretical considerations, this paper will examine the nature and scope of union political action, some factors that affect levels and intensity, and the evidence on the relationship between political action and collective bargaining. The paper begins with a brief case study of union political action in New York state.^a

A CASE STUDY OF UNION POLITICAL ACTION

The New York State Public Employees Fair Employment Act (Taylor Act) was amended in 1977 to eliminate fact-finding for police and firefighter bargaining units and to replace it with binding arbitration of disputes. The amendment provided for a 2-year sunset provision. When the 2 years was up, New York state unions and municipalities lobbied the state legislators for their respective positions. The unions, who wanted

to keep arbitration, argued that arbitration contributed to labor peace and produced comparable settlements to those under fact-finding. The employers—the New York Conference of Mayors—wanted to scrap arbitration, because it increased the rate of impasse; it constituted an invasion of the authority of government; it cost a great deal; and it took away the right of the parties to say no to a settlement. For his part, the Governor wanted to keep arbitration but make it binding only on the union. The Public Employment Relations Board (PERB), the neutral agency, recommended keeping arbitration without modification. PERB argued that 2 years was not a long enough period to judge the arbitration process. The police and firefighter unions extensively lobbied the state legislators. They held face-to-face meetings, submitted briefs, appeared before select committees, etc. A compromise was finally worked out when government finally realized that the unions had the votes to renew the arbitration process. The final bill that was passed and signed by the Governor provided for a 2-year extension with minor changes to the arbitration process.

In the final analysis, the unions, employers and their organizations, neutral agencies, and the public, through their elected representatives, engaged in an intelligent debate about the merits of arbitration versus fact-finding as a dispute resolution process. It is true that this case demonstrates the exercise of considerable union political power, but it also shows that conducted in a pluralistic setting, a wide range of legitimate views were exchanged, and in the end, a reasonable outcome was achieved.

THEORETICAL CONSIDERATIONS

Freeman^[6] offers a plausible explanation for the failure of public sector unions to wield excessive political influence and power. While it is true that public sector unions can affect employer behavior through the political process, because they help elect executive and legislative branches, the demand for public sector labor is not necessarily more inelastic than in the private sector. Freeman suggests that the discipline of the budget, the high labor intensity of public services, and the ability of citizens to act as a constraint on public sector

^aBased on a paper by Kochan.^[5]

wages through such activities as referenda, limit the power of public sector unions. Anderson and Delaney^[7] develop a conceptual framework for the study of political activities. They make a distinction between activities directed at collective bargaining and those devoted to long-run political benefits for union members generally.^b

TYPES AND INCIDENCE OF POLITICAL ACTIVITY

In the summer of 1988, the International Cities and Counties Management Associations surveyed city managers in all U.S. cities over 10,000 population, where some of their employees were in a union or association. The 910 survey respondents provided a rare glimpse into the scope and character of union political activities in America. City managers were asked to list the number and type of union political activity over the previous 10-year period (1978–1988). Table 1 shows the breadth of coverage of political activities throughout the country. In only a few states were there no reports of union political activities (Alabama, North Dakota, and South Carolina), and in these states, there were only one or two cities reporting. In terms of the raw numbers, California, Florida, Michigan, Pennsylvania, and Texas have the highest state totals of political activities. When expressed as per city rates, the District of Columbia, Hawaii,

^bFor a thorough review of the literature on this topic, see Anderson and Delaney.^[7]

Table 2 Union municipal political activities by occupational groups

	No. of cities	Per city rate of electoral politics	Per city rate of lobbying	Per city rate of publicity campaigns	Per city rate of total political activity
Police	804	1.84	0.84	0.59	3.27
Fire	619	2.29	1.06	0.71	4.06
Sanitation	316	2.39	1.02	0.79	4.2
Public works	679	1.85	0.84	0.62	3.31
Other	665	2.01	0.85	0.63	3.49

Nevada, West Virginia, and Wyoming had the most significant levels of political action.

In Table 2, the data are broken down by occupational group (police, fire, sanitation, public works, and other) and by electoral politics (candidate endorsements, financial contributions, and manpower or in-kind support), publicity campaigns (mismanagement disclosure or publicity), state lobbying (including referendum campaigns), and total political actions.

Electoral politics is by far the most popular form of political activity across all occupational groups reported, with sanitation and firefighter unions showing the highest rates per city and police and public works the lowest. In order of declining importance, lobbying and publicity campaign rates were distributed in the same manner across occupational units as electoral politics.

Overall, there were on average between 3.3 and 4.2 incidents of political activity reported by city over the previous 10-year period. It was not surprising that sanitation unions were the most politically active over this period, because they were confronting the issue of the contracting out of their services, and the collective bargaining process was ill-equipped to handle it.^[8] Additionally, high levels of political activity were expected for firefighter unions local, given the rich history of the International Association of Fire Fighters as an American Federation of Labor craft union.

DETERMINANTS OF UNION POLITICAL ACTIVITIES

Anderson and Delaney^[7] show that union political action is inversely related to success in bargaining and weak legislation. They also found that factors that determine union involvement in electoral politics differ from those that determine union involvement in legislative politics. Chandler and Gely^[3] find that electoral politics is a complement to collective bargaining.

Hebdon and Stern^[9] postulate that where the collective bargaining law fails to provide finality, there will be higher than average levels of political action.

In this case, because unions cannot strike or force an agreement through arbitration, greater use of political pressure is expected. Here, publicity campaigns are more likely to be used as pressure tactics as part of the bargaining process. Bargaining laws were shown to have a negligible impact on electoral politics and state lobbying.^[9] Only under final offer arbitration^c is there a higher propensity to engage in electoral politics when compared to right to strike laws, but this is only significant at the 10% level. The unambiguous result is the stronger propensity to conduct publicity campaigns when under a strike ban law compared to right to strike laws. The Hebdon and Stern interpretation of this finding is that unions use mismanagement threats and publicity campaigns as substitute pressure tactics for threatening or organizing a strike. In other words, laws that permit legal strikes channel conflict away from publicity campaigns against public employers to more traditional strike pressures.

Also tested was Anderson's^[10] hypothesis that union political action, necessary for the introduction of the collective bargaining law, diminishes over time as the union-management relationship matures. Hebdon and Stern found no support for Anderson's^[10] hypothesis that political action diminishes as the union-management relationship matures. In fact, political actions increased significantly with the age of the relationship over this 1978–1988 period.

POLITICAL ACTION AND COLLECTIVE BARGAINING

Unlike their counterparts in the private sector, public sector unions may play a direct role in electing their bosses.^[11] Collective bargaining performs a political function in the sense that a system of governance is established. Unlike the private sector bargaining model, in the public sector, it takes on a multiparticipant character that includes taxpayers, unions, politicians,

^cUnder final offer arbitration, the arbitrator must choose the last position of management or of the union.

school boards, employer organizations, and other interest groups.

Thus, to achieve their goals, collective bargaining and political action may present strategic choices for unions in the public sector. There is some evidence from California, for example, that unions in the public sector seem to prefer political action (forming coalitions and lobbying) over industrial action and strikes.^[12] This substitution of political actions for striking also appears in the work of O'Brien,^[4] who showed that the political activities of police and firefighters' unions could be more important than collective bargaining in pay determination. Finally, Hebdon and Stern^[9] showed that a hidden cost of strike ban laws is the redirection of conflict away from strikes to such other expressions as publicity campaigns.

Community-Based Planning for HIV/AIDS

Bruce W. Kieler

Wharton County Junior College, Wharton, Texas, U.S.A.

Ishak Saporta

Faculty of Management, Tel Aviv University, Tel Aviv, Israel

INTRODUCTION

During the past decade, the devolution of responsibility for health care and social support services programs for persons infected and affected by human immunodeficiency virus (HIV)/acquired immune deficiency syndrome (AIDS), from the federal and state levels to the local level, was accompanied by an increasing utilization of community-based participatory planning entities. These entities became the primary means used for prioritizing services and allocating resources to meet the needs of persons living with AIDS, caused by the HIV, and for implementing HIV prevention programs throughout the United States. These participatory planning entities are also being used in other service areas including mental health, substance abuse counseling, housing, tobacco control, and disease prevention and education programs. They include such organizations as health services planning councils, health care consortia, disease prevention planning groups, tobacco control coalitions, and housing planning committees.

Despite their widespread usage, very little is known about community-based participatory planning entities, their formation, operations, development, and effectiveness over time. The study of community-based participatory planning entities can be based on a variety of theoretical perspectives including small group formation, authority in groups, procedural justice, group decision making, conflict resolution, organizational environment and form, institutionalization of new organizational forms, population ecology of organizations, organizational innovation and change, organizational alignment with the environment, management of strategic alliances, and coordination of services. The goals of this chapter are to examine several of the leading theoretical perspectives that are relevant to the study of the expanding organizational population of community-based participatory planning entities, and to suggest a methodology for conducting case studies of these entities.

BACKGROUND

This article is an update of Chapter 11, “Community-Based Planning,” by Kieler.^[1]

The rapidly changing health care industry in the United States suggests a dynamic and turbulent organizational environment. Into this complex and unpredictable environment, an unusual type of planning organization is being embedded, namely, the community-based participatory planning entity. This type of organization is variously called a community-based planning council, committee, consortium, coalition, or group. Establishment of these new organizations is mandated by both federal and state legislation. The premier examples of these new entities are the HIV health services planning councils mandated by Title I of the Ryan White Comprehensive AIDS Resources Emergency Act of 1990 (i.e., the CARE Act), under Public Law 101-381 as amended, and the HIV health care consortium mandated by Title II of the CARE Act. Another such planning entity is the HIV prevention community planning group (CPG) that is mandated by the Centers for Disease Control and Prevention.^[2] The HIV prevention CPG has responsibility for addressing the needs for education about and prevention of HIV infection in almost all public health jurisdictions in the United States.

Community-based participatory planning entities have many of the characteristics that define a coalition.^[3,4] Definitions of each of these entities, as well as enumeration of their respective roles, responsibilities, and mandates, are usually provided in the specific legislation or program announcements authorizing their use. Specific instructions to local governmental or health jurisdictions about establishing these entities are usually contained in the program guidance issued by the federal or state agency responsible for implementing the program. For example, Minkler^[5] provided guidance in community organization and community building for health, whereas the Academy for Educational Development^[6] and McKay^[7] both provided extensive discussions of the HIV prevention community planning process.

Several papers on Title I planning councils look at: 1) various issues and challenges that confront planning councils;^[8,9] 2) the initial stages of development of a typical planning council;^[10,11] 3) institutionalization and legitimation of a planning council process;^[11] 4) decision making by a planning council;^[11] and 5) organizational environment and organizational form of a planning council.^[11,12] Other papers on the Title I process focus on the types and availability of HIV/AIDS services before and after the allocation of Title I funds,^[13–16] as well as on the impacts of the various CARE Act titles.^[17–23] Several major unpublished manuscripts focus on the implementation of the various CARE Act titles, including a report on challenges facing Title I and Title II planning entities that was submitted to the AIDS Action Foundation in 1993^[24] and a report on the implementation of Title I in six major U.S. urban areas that was submitted to the Kaiser Family Foundation in 1994.^[25]

Funding for the various CARE Act titles^[26–28] and the effectiveness of services provided by these funds^[29–31] are explored in a number of reports and position papers. The general conclusion is that the CARE Act has resulted in substantial additional services and increased access to services for persons living with HIV disease. The recurring challenges that the CARE Act community-based planning entities must face in their decision-making processes are noted both in news reports and published research. These would include reports on contractual disputes, program management, program effectiveness, and use (and misuse) of funds.^[32–34]

In reporting on a multiyear observational study of the Oakland HIV health services planning council, Kieler et al.^[8] noted that, at the time the CARE Act was enacted by the U.S. Congress, the use of community-based participatory planning entities was popular with HIV/AIDS advocates, HIV/AIDS service organizations, and federal officials alike. This model of health care and support services planning provided a way for community-based organizations and public sector agencies, as well as individuals infected and affected by HIV disease, to play key roles in these newly initiated and federally mandated planning councils. Additionally, this model appealed to local agencies because it offered local control over the allocation of funds to meet local needs for health care and support services. It appealed to federal officials because this model placed AIDS constituency groups in the position of having to work collaboratively at the local level to achieve expanded availability of services, rather than constantly appealing to Congress and the federal executive branch in an ad hoc fashion for more funds.

The experiences of a number of planning councils in different parts of the country, most notably the

Oakland HIV health services planning council, suggest that this model of planning does work, but not in the collaborative, rational fashion envisioned in Title I of the CARE Act. As Kieler et al.^[8] reported, local control of the program in the Oakland area was accompanied by interorganizational conflict, accusations of personal and organizational misconduct, frequent challenges to the legitimacy of the process, and a general sense that local political factors played too great a role in priority setting, resource allocation decisions, and contracting for services. Not only in Oakland, but nationwide, local governmental entities and community-based groups have experienced challenges in grass roots decision making regarding implementation of Title I. In his study of planning council decision-making behavior, Slack^[35] applied a political model (the zero-sum model) and a bureaucratic model (the Herbert thesis) to identify the factors triggering conflictual zero-sum behaviors.

However, the Kieler et al.^[8] study found that, in spite of these difficulties, the Oakland planning council was able to distribute funds approximately on schedule to local service providers, and the availability of needed services was increased. The findings of the Oakland study suggest a number of ways that a planning council could be structured to increase its effectiveness while reducing interpersonal and interorganizational stress among service providers that the process induced in the past.

Additional work needs to be done to develop a theory-based literature that will document, explain, and analyze all aspects of the establishment, operation, development, and effectiveness of these newly mandated community-based participatory planning entities, and guide the establishment and development of future participatory planning entities. Such a literature might also serve as the basis for building organizational theory specific to participatory planning entities such as planning councils, consortia, CPGs, and coalitions.

AN INTEGRATED THEORETICAL MODEL

Federal and state programs mandating the use of community-based participatory planning entities in local health care and support services environments are only a part of the major changes that are resulting in the restructuring of health care and health-related services. Scott^[36] observed that the medical care field is a multifaceted and dynamic scene that it is complex and rapidly changing, that health care organizations in the United States have undergone a revolution during the past half century, and that particularly dramatic changes have occurred during the past two decades. "To throw some light on the current situation," Scott

described the nature of the changes that have occurred in health care organizations, particularly those in the medical care delivery system. Scott was convinced that “we will not make much headway in our understanding of complex societal systems until we begin to examine the ways in which institutional and technical environments, organizational fields, [organizational] populations, organizational sets, and individual organizations act and interact to constrain and change each other” (p. 296).

In describing the nature of the changes that have occurred in health care organizations and the medical care delivery system, Scott formulates a general theoretical framework within which to view, interpret, and explain such changes. This framework may provide us with a basis for studying the formation, operations, and organizational development of numerous new organizations, including community-based participatory planning entities, that are emerging in the health care and support services environment.

Scott begins by noting that the various organization theories (e.g., population ecology, strategic management, resource dependency, transactions costs, and institutional theory), which are used by analysts to account for one or another feature of the changing health care scene, “have only recently been developed (most appeared after 1975) and are typically treated by organizational analysts as offering contradictory or competing explanations” (p. 272). Scott feels, however, that each of these perspectives is limited and provides only a partial account of the complex phenomena being observed. Although development of unified theory is beyond the scope of his paper, Scott does propose that “the search for an improved, detailed understanding and for verifiable accounts will be advanced by the development of more integrative frameworks that seek to define where and when—to what types of phenomena and under what conditions—the various theory fragments apply” (p. 272). Scott proposes that the “effort to understand the medical care system should begin at the most comprehensive level—the institutional environment—and then proceed to examine more and more delimited systems and units” (p. 273).

The key features of the organizational analysis model that Scott proposes include three levels, namely, the organizational environments level, the organizational fields/populations level, and the organizational sets/organizations level. For each level, Scott identifies the appropriate theoretical perspective to use in discussing activities at that level.

Scott then identifies the major trends in the development of the U.S. health care sector. These include such features as the increased scale of the medical care system, increased concentration of medical resources devoted to the delivery of health services, and

increased specialization of both individual providers and medical care organizations. These trends also include greater diversification, such as in the range of services and types of clients served. Scott points out that other trends in the health care sector include increased linkages among provider organizations, increased governmental involvement in the health care system, increased privatization, increased managerial and reduced professional influence, and increased market orientation of the health care system.

Within this rapidly changing health care sector are embedded the newly established community-based participatory planning entities to which many must now turn for health care, support services, and prevention/education services.

ORGANIZATIONAL ENVIRONMENT AND FORM

Bidwell and Kasarda^[37] noted that organizational form is not only composed of interpersonal relations of members of the organization, but also contains properties that pertain to the organization conceived of as a collectivity with a unitary character. Some of these properties can be regarded as aggregates of interpersonal relations, such as the division of labor and hierarchy. Others may not be so regarded, such as the size and composition of an organization’s membership, its stock of technological and material resources, its own institutional characteristics (structure, bylaws, rules, policies, and processes), and the technological, physical, demographic, and institutional properties of its environment. The authors caution against using a behavioral approach to a theory of organizational form because of the likelihood that such an approach would yield a theory of “unmanageable complexity and intellectual difficulty.” Instead, they espouse a macrosocial approach that allows the treatment of aggregative properties of the organizational collectivity without appeal to the mediation of interpersonal ties or exchanges. They note that in “taking this step, other properties of the collective unit (such as technology, rules, and laws) are introduced into the web of systemic relationships at the level of the collectivity” (p. 25).

Bidwell and Kasarda next define organizational environment to include all external phenomena that affect or could affect an organization. They identify four aspects of the environment, namely, supplies of resources, actors who supply them or who in other ways may affect their supply, flows of resources to and among various populations of organizations within the environment, and relationships among the environmental actors that influence the flow and utilization of resources. The first two are compositional aspects of the environment and the third and fourth are relational aspects (p. 38).

Bidwell and Kasarda divide the organizational environment into an “internal” and an “external” environment. The internal environment is synonymous with the structure of the organization itself. They posit that organizational structure is the locus of opportunities for and constraints on the organization’s further morphological evolution. The existence of the external environment, in its relational aspects (i.e., the surrounding social and normative order), is another principal source of these opportunities and constraints (p. 39).

In viewing community-based participatory planning entities, such as the CARE Act Title I planning councils and HIV prevention CPGs, as organizations, one finds that this particular population of organizations is continually expanding as additional metropolitan and rural areas turn to this type of organization to address local needs for health care, support services, and disease prevention/education. The specific organizational form that characterizes all community-based participatory planning entities is not a unique form. Although at first glance an argument might be made that these entities have the characteristics of “synthetic” organizations, as defined in Thompson,^[38] their apparently increasing permanence and institutionalization in the local health care environment suggest something more. All such entities appear to have many of the characteristics of what is known in the organizational behavior literature as a “minimalist” organization.

The minimalist organizational form is identified by Halliday et al.^[39,40] in a study of the vital events observed in the organizational population of state bar associations. Furthermore, Aldrich et al.^[41] used a similar approach in their study of U.S. trade associations. Both of these studies focus on minimalist organizations in the private sector and use the population ecology of organizations perspective. (For comprehensive discussions of population ecology of organizations, see Hannan and Freeman,^[42–44] Hannan and Carroll,^[45] Singh,^[46] and Tucker et al.)^[47]

The studies of minimalist organizations observe that such organizations are structurally flexible, frequently exist in relatively non-competitive environments, and have long life spans. These organizations may not demonstrate the patterns of foundings and failures characteristic of most business organizations, and especially not the liability of newness. They are called “minimalist” because they require minimal resources for founding and sustenance.

The differences between minimalist and non-minimalist organizations can be stated in terms of four core dimensions. Halliday et al.^[39] identified these dimensions as follows:

1. **Initial Costs.** Many organizations require extensive capital investments and labor commitments for birth, but minimalist organizations can be

founded with very limited labor commitments and capital. In the case of Title I planning councils, the establishment of a council is mandated by federal law. To qualify for funding, an eligible metropolitan area (EMA) must use its own resources to form a council, the costs of which are not reimbursable. Following a metropolitan area’s qualification for the program, application can be made for Title I formula and supplemental grant funding, and a small part of the total grant funds can be utilized for council support and development.

2. **Maintenance Costs.** Non-minimalist organizations require resource abundant environments for survival, but minimalist organizations can subsist in substantially poor resource environments. In the case of Title I planning councils, even when federal program funds are reduced or withheld, the work of the planning council continues.
3. **Reserve Infrastructures.** Most non-minimalist organizations have few shadow organizational structures or external resources to fall back on in times of hardship, but many minimalist organizations can supplement organizational resources with administrative and other infrastructures to be called on when necessary. In the case of Title I planning councils, numerous reserve infrastructures may exist, including assistance and staffing from the local public health jurisdiction, members who are only nominally or minimally reimbursed for their participation, agencies that maintain their employees on the payroll while they serve on the council, and various incidentals, such as travel time, out-of-pocket expenditures, and use of personal equipment and time for council business, all of which are usually not reimbursed by the Title I grant.
4. **Adaptiveness.** High sunk costs in capital and labor commitments impart structural inertia to many organizations, but low sunk costs enable minimalists to adapt readily to changes in their environments. Minimalists may also gain an advantage from normative flexibility: their conception of what the organization is about can more readily be altered. In other words, the minimalist organization can easily adapt or evolve to fit the particular environment in which it must function. In the case of Title I planning councils, there is an expectation that individual councils will develop in response to the constraints found in each of their local health care and services environments.

In addition to these four critical dimensions, Halliday et al.^[39] identified a subclass of minimalist

organizations that have a unique distribution of vital events because they evidence a high standing on two additional dimensions (p. 457). These dimensions include the following:

5. **Niche Definition.** Most organizations have overlapping or poorly defined niches that encourage competition, but many minimalist organizations have well-defined niches and segmented competitive environments that require minimal defense. This dimension pertains, in some instances, to government-sponsored corporations. In the case of Title I planning councils, a specific niche has been defined by the CARE Act, namely, the planning, prioritizing, and allocation of resources to meet the needs of persons with HIV disease for health care and support services in a specific geographical area. Originally, HIV prevention and education were specifically excluded from the purview of Title I councils. In the case of the HIV prevention CPGs, the Centers for Disease Control and Prevention defined the niche to include HIV prevention planning in a specific geographical area, usually a health jurisdiction or a combination of jurisdictions.
6. **Norms of Competition.** Competition is tolerated in many organizational populations, but a number of minimalist organizations tend to discourage competition. In most cases of this type of minimalist organization, a specific niche has been preserved for a particular minimalist organization (i.e., the minimalist organization has a “regional monopoly” in a clearly delineated territory and no other similar organization is permitted to function within the confines of that specific niche).

In the case of Title I planning councils, the boundaries of each respective EMA define the area in which a particular planning council has the responsibility and authority to plan, prioritize, and allocate resources for health care and support services for persons with HIV disease. Except for the required periodic submissions of supplemental grant applications, through which the metropolitan areas participating in the Title I program receive additional grant funds based on the merits of their application, there is supposedly no competition among the organizational population of Title I planning councils or the EMAs in which they operate. The same is said for each regional HIV prevention CPG. There is no competition among CPGs for funding.

Kieler et al.^[12] posited that the HIV health services planning council, as mandated by Title I of the CARE Act, have all four of the core dimensions manifested by minimalist organizations as well as the dimensions of

the subclass of minimalist organizations enjoying a monopoly in a particular environmental niche. They conclude that the Title I planning councils represent a new organizational population of mandated minimalist organizations in the public sector. Use of the population ecology of organizations perspective in the study of these planning councils could contribute to a greater understanding of this particular organizational population as well as other organizational populations of community-based participatory planning entities such as consortia, CPGs, and coalitions.

COORDINATION OF SERVICES

The responsibility for developing a regional comprehensive plan for the delivery of health care and support services for persons with HIV disease makes the HIV health services planning council mandated by Title I of the CARE Act a key element in the coordination of such services at the local level. Therefore it can be expected that the planning council could face many of the same problems and barriers that Aiken et al.^[48] found to be impeding efforts in the planning and implementation of integrated and coordinated mental health service delivery systems. These barriers include fragmentation of services, inaccessibility of services, lack of accountability of service delivery agencies, discontinuities in services, dispersal of services, wastefulness of resources, ineffectiveness of services, short-term commitments, and multiple local governments. Barriers to coordination are linked to aspects of the service delivery system including organizational autonomy, professional ideologies, conflicts among various client interest groups, and conflicts over who is to control the resources (p. 4). Many of these same barriers to coordination and issues of ideology that Aiken et al. observed in the 1970s were also observed by Kieler et al.^[8] during the Oakland planning council case study in 1992–1995, or 20 years after they were first identified in a similar study of mental health service delivery systems.

Aiken et al. noted that professional ideologies often prevent professionals in one field from wanting to cooperate with professionals in another field. They observe that competing client interest groups may work at crosspurposes, cancel out each other's efforts, and present a less than united front in the community. They also note that service organizations frequently put their own survival and prestige ahead of the needs of the clients. They point out various studies which show that acceptance of clients by service organizations depends on social, cultural, and historical factors, and not just on the needs of the clients; that agencies refer clients to places that profit the agency, rather than to places good for clients; and that agencies like

to have the “right” clients rather than those with the most pressing problems.

Aiken et al. suggested that one way to conceive of a coordinated delivery system was to view it as a change process having several stages. These stages of development are identical to those noted by Hernandez and Kaluzny^[49] and include awareness, initiation of effort, implementation, and routinization or institutionalization. In each stage, specific critical problems emerge:

1. Awareness Stage. The coordination effort usually has an initial period of increasing agitation by community groups and awareness by professional groups that treatment requires specialized services and new programs (p. 22).
2. Initiation of Effort Stage. Problems of gaining power, legitimacy, and funding usually occur in the initiation stage of the coordination effort (p. 22). Kieler^[11] elucidated this stage of development in the Oakland planning council study.
3. Implementation Stage. The problems that arise during implementation usually stem from the choice of the organizational structure for the service delivery system, internal conflicts among key participants, and lack of effective control over other organizations (i.e., resistance to implementation by some of the participants). Another problem that might arise is the transformation of the goals of the change agent. As failures in achieving objectives occur, goals of the program may become displaced (i.e., the change agent might scale down its objectives and begin to concentrate on particular goals that reflect its inherent interests and values) (p. 23). Again, Kieler^[11] found evidence of this stage in the Oakland planning council study.
4. Routinization Stage. The primary problem that might emerge lies with the resource controllers. Without their continued support, even the best of programs or service delivery systems would be jeopardized (p. 23). In the study of HIV planning councils, one recent example of this stands out, namely, the suspension of health care and support services for a person with HIV disease in Norfolk, Virginia, because of a contract dispute between the resource controllers (i.e., the city manager of Norfolk) and the service provider (i.e., Eastern Virginia Medical School Clinics).^[32]

Not only could the Title I planning council process in a particular metropolitan area face the various problems associated with the first three stages noted by Aiken et al.,^[48] it could also face the uncertainty of continued funding. Beginning in spring 1995, efforts

were initiated in the U.S. Congress to secure reauthorization of the Ryan White CARE Act for an additional 5-year period. As of January 1996, the fate of the CARE Act had not yet been decided, nor had any funds been appropriated for the act's various titles for the fiscal year to begin in fall 1996. Non-reauthorization of the CARE Act would have resulted in major changes in the organizational environment of all Title I planning councils, and possibly in their demise as a regional planning and coordinating process for health care and support services for persons with HIV disease. However, Fortunately, final reauthorization was approved by Congress in March 1996. Since that time, Congress has periodically reauthorized the CARE Act.

IMPLICATIONS OF THE OAKLAND STUDY FOR PRACTITIONERS

Analysis of the data pertaining to the Oakland metropolitan area's HIV health services planning council includes a systematic examination, discussion, and critique of several key aspects of the Ryan White CARE Act, the organizational form of the planning council, and the organizational environment in which a planning council must function. It also includes a description of the organization of the Title I process in the Oakland EMA and a discussion on the major issues that the planning council successfully dealt with during the period 1992–1994. It applies a process model of organizational development and change to the planning council's efforts to reform its organizational structure, bylaws, processes, and procedures, and it examines the planning council's efforts to assure adherence to the planning council's own bylaws and Robert's Rules of Order, and to assure the compliance by all planning council members with the conflict-of-interest requirements.

The Oakland study also presents the implications for practitioners of the issues that arose to challenge the planning council during the period of observation. The primary issues and challenges that the Oakland HIV health services planning council faced are probably typical of all such community-based participatory planning entities. These include multiple complex interorganizational relationships, conflicts of interest, preexisting societal tensions, factionalism and competition for influence by the major social groups in the area, changing trends in the epidemic, consumers' conflicting demands for services, competition among service providers for funding, membership burnout, accountability, compliance with bylaws and rules of order, dealing with financially troubled service providers who were understandably reluctant to relinquish grant funding, and competition with other

metropolitan areas for a fair share of the Title I funds. Kieler et al.^[8,12] and Kieler^[11] presented discussions on several of these major issues challenging community-based planning entities.

In mandating the establishment of the HIV health services planning council as the mechanism for assessing needs, setting priorities, and allocating Title I funds to health care and support service providers in an EMA, the CARE Act mandated the creation of a population of new minimalist organizations in the public sector. The CARE Act embedded this new organizational population in local HIV/AIDS-related health care and support services environments that are characterized by uncertainties and limitations of multiple complex interorganizational relationships, rivalries between services providers competing for limited funds, and conflicting demands of various populations that the planning council is mandated by Title I to serve. In other words, the CARE Act set the planning council into a multifaceted, diverse, and dynamic environment (i.e., a turbulent environment). Such an environment can have unpredictable impacts on the membership, functioning, credibility, and viability of the planning council process.

Any new organization, including community-based participatory planning entities, may face a liability of newness. A new planning entity could conceivably face an enormous burden in establishing its organizational legitimacy, in settling on an appropriate organizational structure to facilitate the accomplishment of its legislative mandates, and in adopting a standard operating procedure that would accommodate and satisfy its various stakeholders. The effort to achieve organizational legitimacy could consume an inordinate amount of time and effort during the first years of such an organization's existence.

The Oakland data suggest that a Title I planning council, even though it is a government-mandated organization, can have serious organizational legitimacy problems. These problems with legitimacy were reflected both in the various letters of complaint and in the opinions of providers and consumers about the planning council's prioritizations, allocations of funds, request-for-proposals process, appeals process, and contracting process. Additionally, the periodic efforts to change the planning council's organizational structure, prompted by internal opinion as well as by concerns expressed by federal program monitors, indicated a minimalist organization that was attempting to structure itself in response to environmental challenges to its legitimacy. The challenges to the legitimacy of the Oakland planning council stemmed primarily from the planning council's involvement in the direct allocation of Title I funds to local-level service providers, a role that more appropriately should have belonged to the grantee. However, removal of

the planning council in the mid-1990s from involvement in provider-specific allocations served to increase the perceived legitimacy of the planning council process in the Oakland metropolitan area.

If the organizational ecology concept of failure to survive could be defined to include abrupt and significant changes (i.e., massive changes) in a planning council's membership, organizational structure, bylaws, policies, processes, and/or interorganizational relationships (i.e., its core features), then strong evidence of failure to survive by certain members of this new organizational population could be expected and probably be at a much higher rate than is found in the event histories of other populations of minimalist organizations. However, it should be noted that an initial high rate of "organizational death" typifies many organizational populations, but that this initial high rate declines over time as the population of organizations is legitimated and as the population's members successfully compete with each other for limited resources.

Because it is almost inconceivable that the chief elected official of an EMA and the various stakeholders in the Title I planning council process would condone a non-functional or dysfunctional planning council for very long, massive changes in a planning council's core features might suggest that the planning council is in the process of rapidly adapting itself—it is being adapted—to fit the specific social and organizational environment in which it must function. That is to say, the planning council is evolving to fit the local environment, and its evolutionary track is characterized by punctuated patterns of morphological change. In other words, it is experiencing periods in which changes are unusually significant when compared to its prior state.

However, given the event history of the Title I planning council in the Oakland metropolitan area through 1995, the case for evolution seems weak. The Oakland data from this period suggest an alternative hypothesis concerning massive changes in a particular planning council's core features, namely, that a replacement of an existing planning council by a successor planning council occurred. Furthermore, it appears that replacement of a planning council by a successor planning council is highly feasible, basically without cost, and might even serve to enhance the acceptability, credibility, and viability of the Title I process in an EMA. Swift replacement of an existing planning council, a dysfunctional planning council, or a collapsed planning council does not appear to jeopardize either the area's Title I status and eligibility, or its Title I-funded health and social services delivery system. However, the ramifications of the replacement procedure on perceptions of empowerment of the HIV/AIDS community are yet to be articulated.

CONCLUSION

An examination of the event histories of other Title I planning councils, or other similar community-based participatory planning entities, might provide additional evidence of the occurrence of replacement of an established planning entity by a successor planning entity. Quite possibly, it might be found that, in certain metropolitan areas and jurisdictions, there have been repeated replacements of the local participatory planning entity. Additionally, elaboration and analysis of the phenomenon of replacement of a planning council by a successor council may provide additional support for the hypothesis that environmental selection is occurring in this new population of public sector minimalist organizations.

ACKNOWLEDGMENTS

Preparation of this manuscript was begun during the Oakland HIV health services planning council study and was supported, in part, by a grant from the Henry J. Kaiser Family Foundation (Menlo Park, CA). Additional support came from the U.S. Public Health Service and the University of California's AIDS Research Program. Technical support was provided by the Institute of Industrial Relations at the University of California at Berkeley.

Compensation: Pay and Benefits

James A. Buford Jr.

Ellis-Harper Management, Auburn, Alabama, U.S.A.

INTRODUCTION

Compensation is one of the most challenging areas of human resource management. The compensation system, consisting of pay and benefits, should attract and retain a competent workforce, build motivation and performance, and control costs.^[1] Most organizations in the public sector have job-based classification systems, grant annual pay increases or “step raises,” and offer conventional health insurance and defined benefit retirement programs. In recent years, however, emerging approaches in delivering pay and benefits have begun to gain acceptance. These include skill and competency-based pay, structures with wide grades or bands, merit pay, group incentive pay, managed care, medical savings accounts, and defined contribution retirement programs. Traditional and emerging approaches can be useful, depending on what the organization wishes to accomplish. In any case, clearly articulated strategic objectives are necessary if the compensation system is to match the unique characteristics and culture and effectively contribute to implementing the mission of the organization.^[2]

against classification descriptions arrayed in increasing order of difficulty and responsibility. In the point method, jobs are evaluated based on the degree to which they require factors or subfactors that measure the universal factors mentioned above. The point method is the technique of choice in the private sector and is used increasingly by public organizations such as municipalities and counties.

In evaluating jobs, organizations may use a plan containing a set of class descriptions or factors designed to cover all jobs in a single pay structure or separate plans for each job family, such as clerical, labor and trades, administrative and professional, and so on, and develop multiple pay structures. While placing all jobs in one structure implements the principle of equal pay for work of equal value (or comparable worth), many compensation professionals contend that the work content is too varied to be compared on the same factors. For example, factors that distinguish among levels of equipment operators include manual dexterity, physical effort, and working conditions. These factors rarely apply in clerical and administrative support work; rather such factors as knowledge of office technology, public contacts, and access to confidential data are more important.

JOB-BASED PAY STRUCTURES

Most public organizations use pay systems that focus on work performed in specific jobs. Once pay policies have been determined, the development of a pay system includes determining the internal value of jobs and establishing grades or classes containing jobs having approximately the same value.^[3]

Evaluating Jobs

Organizations first develop an internal hierarchy of job value through a process known as job evaluation. All job evaluation techniques are based, implicitly or explicitly, on the “universal” factors of skill, effort, responsibility, and working conditions. These factors are also set forth in the Equal Pay Act of 1963 (discussed in a following section) as the legal standard for equal work. The most common job evaluation techniques are classification and the point method. Classification, which originated in the public sector, is a whole-job approach that involves matching jobs

Determining Grades

Jobs of approximately equal internal value are then grouped into grades (or classes) that are assigned pay ranges (discussed in a following section). The actual number of grades in a pay structure is a policy question. Specialization and upward mobility are facilitated by a relatively large number of narrow grades. Wider grades promote teamwork and lateral mobility. Some public sector pay structures contain up to 50 grades, while others contain as few as 10. The trend is to have fewer grades in all types of structures. The General Schedule of the U.S. Office of Personnel Management classifies thousands of jobs into 15 grades, which might be considered a reasonable upper limit for most public organizations.

ALTERNATIVES TO JOB-BASED STRUCTURES

While job-based structures are still the major approach to pay in public organizations, they have come under

increasing criticism in recent years. Rather than build participation and contribution to objectives, these structures are seen to be rigid and bureaucratic and to promote individual agendas and entitlement. Alternatives to traditional structures include broadbanding and skill-based pay.

Broadbanding

In broadbanding, a number of grades are consolidated into a single band with a maximum and minimum rate of pay. Most organizations use four to eight bands set at logical breaks in skill or competency levels, such as clerical, technical, administrative/professional, managerial, and executive. Administration of pay to individual employees (discussed in a following section) is typically delegated to operating departments rather than centralized in the human resources department. The contrast between pay grades and bands are illustrated in Fig. 1.

Broadbanding provides greater flexibility to line managers in responding to market pressures and organizing work; however, the culture and work flow of an organization is a major factor in determining if this technique is appropriate. It is most effective with delayed organizations that de-emphasize job boundaries and focus on rewarding entrepreneurship and individual work contributions. In organizations that are hierarchical and job based the technique tends to disconnect pay rates from job families and can create pay inequities and cause legal exposure. Finally, studies have shown that organizations using broadbands have higher labor costs.^[4]

Skill- and Competency-Based Pay Structures

Skill-based pay structures essentially do away with job boundaries. In these systems, the employee is paid for skills mastered and applied in a work situation,

regardless of the tasks assigned at a particular time. Structures typically contain a block of foundation skills, a number of blocks of required or “core” skills, and additional blocks of optional skills. For example, an equipment operator might receive a pay increase for learning a required number of core skills, such as finish grading, even though most of the work consists of less difficult earthmoving tasks such as trenching, rough grading, and loading. A skill-based structure for equipment operators is shown in Fig. 2.

While skill-based structures are used mainly in hourly trade and craft work, competency-based pay extends the concept to administrative, technical, and professional work. However, the term competency covers a wider range of employee attributes, such as a competency to “make effective and timely decisions.” Accordingly, competencies are considerably more difficult to operationally define and build into a pay structure.^[5]

Fig. 1 Pay grades vs. bands.

Fig. 2 Skill-based pay structure.

The next activity is to price the structure by establishing a pay policy line as a basis for pay ranges with minimum and maximum rates of pay. In establishing ranges, the organization must consider what other employers in the relevant labor market pay for similar jobs. This information may be obtained by conducting a compensation survey or by using secondary data. In pricing the structure, organizations may establish grade midpoints that lag, match, or lead the market, depending on funding levels, strategic objectives, and policy guidance. In skill-based structures, the pay must be further allocated to various skill blocks. Because most public organizations have attractive benefits programs (discussed in a following section), the policy is typically to lag or match the market. Moreover, organizations such as units of government would encounter considerable political resistance in setting pay higher than market levels.

Employee compensation is heavily influenced by laws and regulations that emphasize fairness, sufficiency, and protection. The Fair Labor Standards Act (FLSA) establishes the minimum wage, defines maximum hours for various work periods (typically the 40-hour week), provides for overtime pay, and restricts child labor. The FLSA is enforced by the Wage and Hour Division of the U.S. Department of Labor. The Equal Pay Act (EPA) requires employers to provide equal pay for equal work, defined as that which requires equal skill, equal effort, equal responsibility, and is performed under similar working conditions. If jobs are equal, males and females may be compensated differently only if pay is based on seniority, merit, quality or quantity of production (discussed in the following section), or other factors based on sex. Title VII of the Civil Rights Act prohibits disparate treatment in pay based on race, sex, color, religion, and national origin, even if jobs are not equal, and addresses discrimination in the provision of benefits. The Age Discrimination in Employment Act (ADEA) extends protection to persons 40 years and older. The EPA, Title VII, and the ADEA are enforced by the Equal Employment Opportunity Commission. While these are the major laws, other federal laws and regulations apply in specific situations, and many states also have laws applying to compensation.

In job-based structures, pay for employees is administered within the maximum and minimum for the

In Panel A, the grade is divided into quartiles. In Panel B, the grade is divided into 13 steps, with each step representing a 3% increase from the previous step. In Panel C (12 steps), each step represents 3% of the midpoint rate. Most public organizations follow a step approach in administering pay within grades. Pay adjustments are designed to set pay at a level appropriate to the employee's length of service, job performance, and qualifications. The grade midpoint represents the target rate of pay for a fully trained employee performing at a satisfactory level. Recall that midpoints were set previously at or near the market rate of pay. When bands are used, organizations often establish guidelines or "shadow grades" within bands as shown in [Fig. 1](#). Where this is the case, within-band pay adjustments are handled similarly to within-grade adjustments.

Seniority-based pay systems are common in the public sector. In these systems, employees are placed in and advance through rate ranges based on length of service (the familiar annual step increase). In recent years, however, various forms of performance-based pay for both individuals and groups (discussed in following section) have gained increased acceptance.^[6] Merit pay is an addition to an employee's base wage or salary in recognition of *past* contributions. A major disadvantage of merit pay is that increases are "locked in" and have a compounding effect even if performance declines. This problem is overcome by one-time incentives or bonuses, offered as an inducement for *future* performance. In this approach, pay reverts to the base

© 2008 by Taylor & Francis Group, LLC

rate during any period that performance does not exceed the standard, and the incentive amount is therefore “at risk.” Individual incentive plans such as piecework and performance bonuses are found mainly in the private sector, although a few public organizations are beginning to implement this approach.

In skill- and competency-based structures, pay is increased when an employee has mastered a skill or competency. Often, work sample tests are used for this purpose. For example, to demonstrate the skill of finish grading, an equipment operator might be required to operate a motor grader, manipulating controls, adjusting the height and angle of the blade, and positioning the wheels to raise or lower terrain to grade marked on reference stakes.

Rewarding Group Performance

Various types of incentive plans are used to reward group or team performance. In the approach known as “gainsharing,” a productivity standard based on allowable labor costs is established. For example, the labor cost standard in a solid waste collection department may be \$100,000 for a given month. If actual costs are \$95,000 during the month, there is a “gain” of \$5000. In distributing the gain, 50% is typically allocated to the work group, 25% is retained by the organization, and 25% is set aside for periods in which labor costs exceed the standard during a period. Note that in this approach, pay is at risk, as was the case with individual incentives. The procedures discussed above follow the Scanlon Plan, which is the gainsharing approach that has gained the most acceptance in the public sector.

DETERMINING EMPLOYEE BENEFITS AND SERVICES

The creation of a benefits package is the final step in designing the compensation program. As was the case with pay, strategic objectives and policies are important. Because public organizations do not typically lead the market in pay, a reasonably attractive benefits package is necessary to attract and retain employees. Certain benefits are required by law. These include workers’ compensation, unemployment compensation, and Social Security (some public jurisdictions elected not to participate and are required to offer a comparable retirement benefit). Optional benefits include retirement and savings plans, health and medical plans, payment for time not worked (paid leave and holidays), and miscellaneous benefits. Controlling the escalating costs of retirement and health benefits is a major

challenge and public organizations are beginning to adopt strategies and approaches similar to those used in the private sector.

Retirement and Savings Plans

Most public organizations, especially units of government, offer defined benefit retirement plans or pensions that provide lifetime annuities of 50–70% of employees’ pre-retirement earnings. It is well documented that these plans cost more to operate than defined contribution plans, similar to 401 (K) plans, which predominate in the private sector. Although few public organizations offer these plans, the number is expected to grow as plan administrators attempt to control costs.^[7]

Medical and Health Benefits

In the area of medical and health benefits, the traditional approach is to provide insurance coverage where the employees can select a health-care provider (physician, hospital, clinic, etc.). As is the case with defined benefit retirement programs the growing cost of these plans is a major concern and organizations are considering less expensive alternatives. A small but growing number of public organizations have begun to implement managed care plans through health maintenance organizations or HMOs. These organizations typically negotiate a flat rate and have an incentive to promote wellness rather than respond to costly medical emergencies. Under managed care, patients must use health-care providers designated by the plan. Moreover, the provider has the responsibility to provide care based on cost effectiveness, not necessarily on the needs of the patient. These and other issues have led to legislation at the state and federal levels establishing “bills of rights” for employees covered by managed care plans. Other approaches to controlling include preferred provider organizations and medical savings plans, which may be used in combination with traditional coverage and managed care.^[8]

Other Benefits and Services

In regard to payment for time not worked, public organizations tend to give more paid time off than their counterparts in the private sector. Practically, all organizations observe national holidays and others with a regional or statewide significance. Most also provide various forms of paid leave, including vacation, sick, military, jury, and so forth.

Other benefits and services often provided by public organizations include group life insurance, employee assistance programs, tuition refund programs, and credit unions.

SUMMARY AND CONCLUSION

Compensation practices vary widely in organizations. In pay systems work performed is exchanged for monetary rewards. Such work is typically organized into jobs, although it may be structured in other formats such as skill- or competency- based systems or replacing grades with broad bands that ignore or deemphasize job boundaries. In either case the work must be evaluated based on its content, the knowledge and skills needed to perform the work must be priced in the external market and employees must be rewarded for their individual contributions. Basing pay adjustments on seniority and past performance (merit) is common practice, but there is increasing interest in one-time individual and group incentive systems. These systems place pay "at risk" and are an inducement to future performance.

In non-monetary compensation, benefits are provided for membership in the organization. Certain benefits such as Social Security mandatory and must be administered in accordance with applicable laws and regulations. Other benefits are discretionary; however organizations usually offer retirement and medical benefits. Most public organizations offer defined benefit (pension) retirement plans and traditional health insurance plans, but escalating costs have resulted in a growing trend toward defined contribution plans similar to 401(k) plans in the private sector and managed care approaches including health maintenance

organizations (HMOs) and related programs emphasizing pre-paid medical care and wellness.

All aspects of compensation must be administered in accordance with legal requirements such as the Fair Labor Standards Act, The Equal Pay Act and Title VII of the Civil Rights Act as well as additional federal and state laws and regulations. The challenge for all organizations is to use compensation dollars wisely and to develop a system that is legally defensible, that attracts and retains well-qualified employees and that motivates these employees to work efficiently and effectively in achieving strategic objectives.

INTRODUCTION

A comprehensive annual financial report (hereafter, “CAFR”) is a general-purpose financial report that is comprehensive in the depth of its reporting detail, and which provides a full disclosure of the financial affairs of the reporting entity, beyond the requirements of generally accepted accounting principles (hereafter, “GAAP”), and other applicable legal and contractual requirements. Pursuant to the 2003 *Codification of Governmental Accounting and Financial Reporting Standards* (hereafter, “Codification”), every government “should prepare and publish a CAFR covering all funds and activities of the primary government (including its blended component units) and providing an overview of all discretely presented component units of the reporting entity.”^[1]

A CAFR is recommended but not required under GAAP. However, the minimum requirements for fair presentation in connection with general-purpose external financial reporting are mandatory, and are specified in detail in the *Codification*. The CAFR is to be a general-purpose report, which means that its contents are intended to meet the needs of a broad range of users, including citizens, investors, credit rating agencies, other governments, oversight authorities, and other interested parties. The CAFR also provides supporting schedules and other information necessary to demonstrate compliance with finance-related legal requirements and contractual provisions, and statistical data pertaining to the reporting entity.^[2]

REPORTING ENTITY

The financial reporting entity covered by the CAFR includes: 1) the primary government; 2) organizations for which the primary government is financially accountable; and 3) other organizations of such nature or significance that their exclusion would cause the basic financial statements of the primary government to be incomplete or misleading.^[3] The nucleus of the reporting entity is the primary government, having as its foundation a separately elected governing body, which is legally separate from other governing bodies, and which is also fiscally independent from them.^[4]

A primary government is any state or local government that meets these criteria.

The primary government consists of all funds (defined as budgetary and accounting entities having a self-balancing group of accounts), departments, organizations, agencies, institutions, and other offices that are not legally separable from any part of the primary government. Certain other units may be required to be included with the primary government for financial reporting purposes. Such component units of the primary government are legally separable organizations for which the elected officials of the primary government are: 1) financially accountable; 2) able to control through appointment of the component unit’s officials; 3) otherwise able to impose their will on that organization; 4) able to access or employ that organization’s resources to the benefit (or burden) of the primary government; or 5) obligated in some manner for that organization’s debt.^[5]

Component units may therefore include other governmental organizations, not-for-profit corporations, and for-profit corporations. In any case, “component units are to include all other organizations for which the nature and significance of their relationship with a primary government are such that exclusion would cause the reporting entity’s financial statements to be misleading or incomplete.”^[6] Due to the closeness of the financial relations between the primary government and its component units, the latter should be blended as though they are a part of the primary government.^[7] Blending involves reporting transactions and account balances in a manner similar to those of the primary government itself. However, most component units should be discretely presented as well. Discrete presentation entails reporting the component unit’s financial detail on the financial statements in columns and rows separate from those of the primary government.

INTRODUCTORY SECTION

The CAFR should contain: 1) an introductory section; 2) a financial section; and 3) a statistical section. The purpose of the introductory section is to familiarize the user of the CAFR with the structure of the government, the nature and scope of its activities and the services it provides, and certain relevant aspects of its

legal environment. The introductory section includes a letter of transmittal from the government's chief financial officer conveying the report to the legislative body. The letter of transmittal includes a brief profile of the government and any information that CAFR users may find useful in assessing the entity's financial condition, such as developments in the local economy, long-term financial plans, cash management and investments, risk management, and pension obligations (together with any other post-employment benefits). If the government has been awarded a Certificate of Achievement for Excellence in Financial Reporting by the Government Finance Officers' Association, the current certificate is included after the letter of transmittal. This section also includes the names of the entity's principal officials, an organization chart, and any other material deemed appropriate by management.^[8]

FINANCIAL SECTION

The financial section is to present a top-down, comprehensive overview of the entity's financial operations. It contains the government's basic financial statements, along with all required supplementary information (hereafter, "RSI"), and the report of an independent auditor. Also included should be management's discussion and analysis (hereafter, "MD&A"), all RSI other than MD&A, and combining and individual fund statements and supplementary information. The financial section also contains any schedules necessary to demonstrate compliance with legal and contractual commitments, and other schedules in support of individual financial statements (e.g., lists of long-term debt obligations, investments, cash receipts, etc.).

Independent Auditor's Report

The report of the independent auditor appears first in the financial section. It is widely regarded as the most important document contained within the financial section. The report offers a professional opinion on the fair presentation of the financial position and results of operations of the entity for the period covered. Consequently, it is to be read carefully.

Management's Discussion and Analysis

The independent auditor's report must be immediately followed by the MD&A. The MD&A is always RSI. The MD&A is a relatively new requirement, which was introduced in June 1999. An MD&A has been a GAAP requirement of private firms for decades. The purpose

of its inclusion in governmental financial reports is to permit management to communicate its interpretation of the entity's financial performance during the period covered by the financial statements, compared to prior periods.^[9]

MD&A should be written in an easily understandable manner, and may include such tables, charts, and graphs as may enhance its readability. The focus of MD&A is on the primary government; however, component units may also be discussed. GAAP specifies certain minimum requirements for MD&A.^[10] However, it must be stressed that the standards are designed to permit management flexibility to present relevant data at whatever level of detail that it may deem appropriate. Insofar as MD&A is RSI, a government may not go beyond the topics required by GAAP for inclusion in MD&A. This means that MD&A is not to repeat information presented in the letter of transmittal, and is to avoid a "boilerplate" approach to the presentation of relevant financial information.

Requirements for MD&A include: 1) a brief discussion of the financial statements; 2) condensed financial information from the government-wide financial statements (i.e., statement of net assets and statement of activities) in comparison to prior years; 3) analysis of the government's overall financial position that aids users in determining whether the financial position has improved or deteriorated; 4) analysis of significant changes in fund balances; 5) analysis of significant variations between the original budget, amended final budget, and actual results; 6) a description of significant long-term liabilities and debt activity; 7) a discussion of infrastructure assets, if the modified approach is used to report some or all of a government's infrastructure;^[11] and 8) a statement of currently known facts, decisions, or conditions that are expected to have a significant effect on the financial position or results of operations.

Basic Financial Statements

MD&A is followed by the government's basic financial statements. Together with the accompanying notes to the financial statements, the basic financial statements are at the core of the CAFR financial section. Depending on the extent of a particular government's operations, some nine basic financial statements may be required:

- *Government-wide financial statements:*
 1. Statement of net assets (i.e., balance sheet)
 2. Statement of activities (i.e., operating statement)
- *Fund financial statements:*
 3. Balance sheet—governmental funds

4. Statement of revenues, expenditures, and changes in fund balance—governmental funds
5. Statement of net assets—proprietary funds
6. Statement of revenues, expenses, and changes in net assets—proprietary funds
7. Statement of cash flows—proprietary funds
8. Statement of fiduciary net assets
9. Statement of changes in fiduciary net assets

In addition, the financial section contains separate subsections for each fund type (i.e., governmental, proprietary, and fiduciary), including combining statements by fund type, along with physically separate individual funds statements, including a balance sheet, operating statement, budget-to-actual comparison schedules, and prior-year comparative data. Normally, fund data for discretely presented component units are not provided, in that interested parties can find such detailed financial information in the separately reported financial statements of such units.

Required Supplementary Information, other than MD&A

The basic financial statements are followed by RSI other than MD&A. The specific presentation depends on a government's specific circumstances. It is possible that four categories of RSI other than MD&A should have to be reported: budgetary comparison schedules showing budget vs. actual comparisons for the year covered by the financial report for all funds that have annually appropriated budgets;^[12] infrastructure condition and maintenance data (for entities that use the modified approach for infrastructure reporting); pension trend data for certain pension plans (including a schedule of funding progress and a schedule of employer contributions); and revenue and claims development trend data for governments participating in public-entity risk pools.^[12] Under a recently adopted GAAP requirement, the budgetary comparisons are to be based on the fund, organization, or program structure that the entity uses for its legally adopted budgets.^[13]

STATISTICAL SECTION

The purpose of the statistical section is to provide CAFR users with a broad range of information permitting a more complete understanding of government operations and financial trends than would be possible from the financial section alone. The statistical section therefore provides trend data and non-financial

information that may be useful in assessing the reporting entity's financial condition. These data may be of particular use to investors, creditors, and bond rating agencies in identifying non-financial trends that may affect the entity's creditworthiness.

In May 2004, the Governmental Accounting Standards Board (hereafter, "GASB") issued new GAAP requirements in order to improve the understandability and usefulness of supplementary information presented in the CAFR statistical section.^[14] While much of the contents of the statistical section required since 1980 remain, the new standards provide for improved consistency and comparability in reporting among governments. The new guidelines also call for appropriate narrative explanations for certain information presented in the statistical tables.

Statistical Section Contents

The revised statistical section is to provide information in five categories:

1. Ten years' worth of financial trend information, in order to be able to assess how an entity's financial position has changed over time (including net assets and fund balances, and changes therein).
2. Revenue capacity information, which pertains to a government's ability to generate own-source revenues (including information on revenue base, tax rates, principal taxpayers, property tax levies and collections).
3. Debt capacity information, to assist users to understand and assess a government's debt burden, and its ability to issue additional debt (including 10 years' worth of data on outstanding debt per capita and as a percentage of personal income, general bonded debt to the value of taxable property and per capita, current year direct and overlapping debt, legal debt margin, the applicable debt ceilings, and 10 years' worth of data on revenue-backed debt).
4. Demographic and economic information, to assist users to understand an entity's socioeconomic environment (such as population trends, personal income, and unemployment rates, and information on the principal employers in the community).
5. Operating information, to provide contextual information about a government's operations and resources (including numbers of government employees, performance and activity measures, such as crime rates, police and fire calls, miles of roadway paved, visitors to city parks, etc.), and information about the volume, usage,

or nature of capital assets (such as roads, bridges, sewers, buildings, etc.).

New Requirement for Narrative Explanations

In addition, governments are encouraged to use narrative explanations to enhance the understandability and usefulness of the quantitative information provided in the statistical section. Such narrative should address the objectives of reporting statistical information in general; identify and explain relationships among the information contained in various tables, and in other sections of the CAFR; and account for any anomalies or unusual trends in the data that CAFR users would not otherwise be able to understand. The new reporting guidelines for the statistical section are applicable for financial reporting periods beginning after June 30, 2005.

ADDITIONAL (OPTIONAL) CAFR SECTIONS

Governments are free to present other sections in the CAFR in addition to (but not instead of) the three basic sections.^[15] The three most common additional sections are:

1. *Investment section.* This may be presented since investing activities may be a significant activity in governments with large pension programs or that sponsor external cash and investment pools.
2. *Actuarial section.* This section would be devoted to the asset and liability calculations of actuaries that are used to establish pension plan funding levels, and the required annual employer contribution.
3. *Single audit section.* Single audits are required under the terms of federal grants and are conducted according to audit standards established by the U.S. Government Accountability Office (formerly the General Accounting Office). The single audit report is typically issued under separate cover, and is included in the CAFR only by reference. However, a reporting entity may elect to include this information in a separate section in the CAFR.

MINIMUM REQUIREMENTS FOR FAIR PRESENTATION

If prepared and published by a government, a CAFR must meet the minimum GAAP requirements for fair presentation. These apply exclusively to the contents of the financial section, and are summarized in Table 1.

FUTURE DEVELOPMENTS AFFECTING THE CAFR

The GASB in June 2004 issued an exposure draft of a proposed new Statement of Governmental Accounting

Table 1 Comprehensive annual financial report: minimum requirements for fair presentation in the financial section

Government-wide financial statements	Fund financial statements		
	Governmental funds	Proprietary funds	Fiduciary funds
<i>Management's discussion and analysis (MD&A)^a</i>			
Statement of net assets Separated into governmental and business-type activities Three-part categorization of net assets	Balance sheet	Statement of net assets; or balance sheet (optional)	Statement of fiduciary net assets
Statement of activities Net cost format Program vs. general costs Program vs. general revenues	Statement of revenues, expenditures, and changes in fund balances	Statement of revenues, expenses, and changes in net assets	[Not applicable]
[A government-wide statement of cash flows is not required]	Budgetary comparison statement (optional to place here or in the Notes)	Statement of cash flows	Statement of changes in fiduciary net assets
<i>Notes to the financial statements</i>			
<i>Budgetary comparisons^b</i>			
<i>Infrastructure condition data^c</i>			
<i>Other required supplementary information (RSI)^d</i>			

^aMD&A is always RSI, which must be presented in accordance with GAAP, but which is unaudited.

^bA budgetary comparison statement (subject to audit) may be used as an alternative to presentation as RSI (which is not subject to audit).

^cRequired if the modified approach is used, and depreciation of infrastructure is not reported.

^dRequired of pension trust funds and public-entity risk pools; the latter are classified as proprietary funds.

Concepts No. 3, *Communication Methods*. As a concept statement, if adopted, the document would not set GAAP requirements per se, but would establish the basis for setting standards in the future. The exposure draft proposes a framework for selecting communications methods to present information in financial reports. The effect of the proposed guidelines would be to more clearly identify which sorts of information should be presented on the face of the financial statements (i.e., displayed there), included in the notes to the financial statements (i.e., disclosed there), or provided as supplementary information, either in the form of RSI, or freely presented as supplementary information. If adopted, the proposed concept statement is expected to be issued towards the end of the second quarter of 2005.

Conflict of Interest

Russell L. Williams

*Askew School of Public Administration and Policy, Florida State University,
Tallahassee, Florida, U.S.A.*

INTRODUCTION

The phrase “conflict of interest” may appear so self-explanatory that it does not require further examination. However, thoughtful scrutiny reveals that many of the pitfalls and failures associated with public service at any level grow out of legal or ethical conflicts of interest. Some consider conflicts of interest to occur only when specific conflict of interest rules or laws are broken. Many of those laws are aimed at specific issues, such as financial disclosure, nepotism, improper use of public resources, or influence peddling. However, in the larger sense, if an individual (or group) functioning under governmental auspices, responsible for making decisions or taking actions affecting the public, places self-interest ahead of public interest in exercising authority, then a conflict of interest exists.

A LONG-STANDING PROBLEM

Arguably, the necessity to address conflict of interest problems was the engine driving the civil service reform movement that started in the late 1800s. Woodrow Wilson’s canonized “The Study of Administration,” written in 1887, clearly recognizes that conflicts of interest form perhaps the most intractable challenge to truly improving and professionalizing public service:

The question for us is, how shall our series of governments within governments be so administered that it shall always be to the interest of the public officer to serve, not his superior alone but the community also, with the best efforts of his talents and the soberest service of his conscience? How shall such service be made to his commonest interest by contributing abundantly to his sustenance, to his dearest interest by furthering his ambition, and to his highest interest by advancing his honor and establishing his character? And how shall this be done alike for the local part and for the national whole? If we solve this problem we shall again pilot the world.^[1]

As obvious as “this problem” was to Wilson, it is also obvious that it was not then, and has not been to

the present, wholly solved. Yet, the modern American civil service system was built on the expectation that government employees’ actions are to be motivated by non-partisan, non-self-interested behavior directed toward the benefit of the public. This expectation was manifested in the Pendleton Act of 1883. Although limited in scope, it was the first substantive effort toward ridding the federal civil service of the blatant conflicts of interest created when the norm was to hire government employees routinely on the basis of their political loyalties. Ironically, however obvious the wisdom of such a reform was to many of the people of the time, it took the impetus created by the assassination of President James A. Garfield by a disappointed office seeker who expected a reward for political service to lead to the passage of that initial template for eliminating conflicts of interest.^[2]

Since the Pendleton Act, efforts have continued to eliminate situations wherein conflicts of interest can occur. Much of what is identified as reforms in “government ethics,” a rather general term, have come to be related to preventing conflicts of interest. This holds true even in the state and local level “ethics in government” initiatives that occurred in the wake of the Watergate government corruption scandal of the 1970s. Many state government ethics commissions or offices focus largely on monitoring financial disclosure statements from public servants, the presumption being that “following the money” reveals whether the potential for conflict of interest problems exists.

CONFLICT OF INTEREST AS A STATUTORY ISSUE

In a country devoted to the rule of law, there has been a logical effort to use laws, rules, regulations, codes of ethics, and even presidential executive orders to define and prevent conflicts of interest by those in public service. Section 201 of Presidential Executive Order 11222, signed by Lyndon B. Johnson in 1965, while not the first attempt at addressing conflict of interest issues by government employees,^[3] established a standard of conduct that not only devoted three of its six provisions to matters concerning conflicts of interest, but also called attention to the need to avoid even

the appearance of such conflicts (the so-called “appearance standard”):

It is the intent of this section that employees avoid any action . . . which might result in, or *create the appearance of*—

1. *Using public office for private gain.*
2. *Giving preferential treatment to any organization or person.*
3. Impeding government efficiency or economy.
4. *Losing complete independence or impartiality of action.*
5. Making a government decision outside official channels; or
6. Affecting adversely the confidence of the public in the integrity of the Government (emphasis added).^[4]

The Ethics in Government Act of 1978, passed during the administration of President Jimmy Carter, reinforced the identification of government ethics with conflict of interest concerns. It too focused on financial disclosure as a means to ameliorate the problem. The act also established the Office of Government Ethics, giving it the responsibility to examine the financial disclosure statements of federal officials. The Ethics in Government Reform Act of 1989 served to strengthen the financial disclosure system, again with the assumption that this was crucial to reducing the potential for conflicts of interest. This approach continues to be echoed in many state and local governments by the use of laws, as well as codes of ethics or conduct.

CONFLICT OF INTEREST AS A PROFESSIONAL ISSUE

Beyond the violation of laws and rules per se, there is another aspect related to conflicts of interest that cannot be overlooked. Intrinsic to the “modern” approach to public administration espoused by Woodrow Wilson is the concept of professionalism (for a discussion of what this might entail, see Ref.^[5]). That is, those who seek to serve the public must treat what they do as more than a mere means to trade labor for wages. They must aspire to levels of professional standards consistent with those expected of doctors and lawyers. Recognizing this, professional associations within the field of public administration also use a statutory (i.e., rule-based) approach regarding conflicts of interest. The codes of ethics of both the American Society for Public Administration (ASPA) and the International City/County Management Association (ICMA) specifically mention the need for government workers to avoid conflicts of interest or

their appearance. ICMA goes so far as to have punitive procedures in place for those found in violation of its code, including those tenets associated with conflicts of interest. In essence, avoiding conflicts of interest is instrumental to meeting the professional standards that define the practice of public administration.

CONFLICT OF INTEREST AS A MORAL ISSUE

Upon his inauguration on January 20, 2001, President George W. Bush repromulgated to all executive branch personnel 5 C.F.R. 2635, *Standards of Ethical Conduct for Employees of the Executive Branch*. Section 2635.101, titled, “Basic obligation of public service,” that contains the following statement:

Public service is a public trust. Each employee has a responsibility to the United States Government and its citizens to place loyalty to the Constitution, laws and *ethical principles* above private gain (emphasis added).^[6]

This is similar in tone to words found in the *Code of Ethics for Government Service*, found in Congressional Resolution 175, adopted by both houses of the 85th Congress on July 11, 1958 and still in effect:

Put loyalty to the *highest moral principals* and to country above loyalty to Government persons, party, or department . . . Uphold these principles, ever conscious that public office is a public trust (emphasis added).^[7]

There is within the above excerpts a clear expectation that public service requires action that is not “merely” legally, but also morally, principled.^a This is couched in terms of where the civil servant’s loyalties must lie. While the legally defined aspects of conflicts of interest can vary from one government entity to another, the ethical aspects do not. While road maps (written laws and rules) exist that, if followed, may allow someone to claim that a specific kind of conflict of interest does not exist, it is usually not so easy to justify actions that, looked at dispassionately, show a lack of regard for the public good. In ethical terms, the government employee is expected to act deontologically.

^aCarol Lewis highlights a classic example of the ramifications of that expectation in her book, *The Ethics Challenge in Public Service* (Jossey-Bass, 1991). She relates the succinct response of George Washington to a friend who was seeking a job: “As George Washington, I would do anything in my power for you. As President, I can do nothing” (Bailey, 1964; 241 pp.).” The root causes and pressures of, as well as the underlying appropriate response to, conflict of interest situations have remained consistent from Washington’s time until now.

There is an underlying moral obligation to do what is best for the public as a whole. This does not leave room for the erstwhile public servant to act egoistically, placing the needs of self, whether for money, power, position, or political advantage, ahead of the public's needs. To do so is antithetical to the concept of American public service, but it is the essence of what constitutes a conflict of interest in the public sector.

THE MOST INTRACTABLE CHALLENGE

In 1887, Woodrow Wilson did not have an answer to the problems stemming from conflicts of interest. Well over a century has passed. While much has changed with the advent of special laws and codes of ethics, somehow much is still the same. Now, as then, it is easy to see why, at the appointive and elective levels of public office, conflict of interest issues create a constant and inevitable tension. No one whose position is so clearly dependent upon the support of specific individuals or groups can be wholly insulated from the pressures that will come from those expecting special treatment in return for that support. However, the danger for the "average," unelected, unappointed public servant is no less considerable, despite, for many, the protection afforded by a merit-based civil service system. Anytime an individual is faced with a situation, no matter how trivial, that places perceived personal gain at odds with the public good, there will be conflicting interests. It may be as simple as favoring a somewhat less-qualified friend over a better-qualified

applicant in the hiring process for a public service job or withholding needed information from another agency in order to make oneself look good at a meeting. The ultimate intractability of the conflict of interest problem is not a function of being able to identify when such a problem exists. Imperfect as they may be, various laws, rules, and codes of ethics provide some assistance in that matter.^b It is in the moral realm, to have or find the strength to act in a manner that is not consistent with one's self-interest, wherein the solution to Wilson's problem is found.

Consolidated Governments

Dan Durning

*Carl Vinson Institute of Government, University of Georgia,
Athens, Georgia, U.S.A.*

INTRODUCTION

The idea of consolidating city and county governments is attractive to a variety of would-be reformers. Since the end of World War II, governmental consolidation proposals have been put forward, studied, or debated every year in dozens of counties and urban areas throughout the United States. However, few proposals have gone to voters, and only about 20% of those have received the needed majority votes.

In this article, the issue of city-county governmental consolidation is examined to identify where and how frequently the consolidation efforts occur, the arguments for and against it, and the evidence about its impacts. A review of the issue shows that consolidation has created heated controversy wherever it has been proposed. It also has generated lively disputes among academic researchers and experts, and a review of the empirical research shows that the debate about the impacts of governmental consolidation is far from settled.

CONSOLIDATED CITY-COUNTY GOVERNMENTS IN THE UNITED STATES

For decades, many researchers and citizens have believed that the fragmentation of local governments—the distribution of governmental responsibilities and powers among multiple governments in a particular location—contributes to pathologies that harm metropolitan areas.^[1,2] Other researchers and observers reject the assertions that governmental fragmentation causes harm. In fact, they argue that it contributes to governmental efficiency.^[3,4]

To remedy the putative problems created by fragmentation, “reformers” have proposed the consolidation of city and county governments. Efforts to consolidate local governments have had limited success: Out of the 3034 county governments in the United States, 39 have consolidated or unified with city governments.

Consolidated governments fall into two groups: those created before World War II and those that came after the war. The pre-World War II group consists of the eight consolidations that date back to 1805, when New Orleans and Orleans Parish were

consolidated. The group includes: Nantucket Town–Nantucket County, MA (1821); Boston–Suffolk Co., MA (1821); Philadelphia–Philadelphia Co., PA (1854); San Francisco–San Francisco Co., CA (1856); New York City and five boroughs, NY (1890s); Denver–Denver Co., CO (1902); and Honolulu–Honolulu Co., HI (1907). These consolidations were created by state legislation.

The post-World War II era of consolidation began in 1947, when Baton Rouge and East Baton Rouge Parish (LA) were consolidated. Since then, 30 other city-county consolidations or unifications have occurred; all but three were approved in local referenda. The Indianapolis–Marion County (IN) consolidated government was formed by an act of the state legislature. The city and county of Broomfield (CO) came through a constitutional amendment approved in 1998 by the voters of Colorado. The city and borough of Yakutat (AK) were incorporated as a consolidated government.

A list of the post-World War II consolidated governments is presented in [Table 1](#). This list shows that most mergers since 1969 have been in smaller metropolitan counties and rural counties, with the exception of the Louisville–Jefferson County (KY) consolidation. Among the recent developments is the case of Camden County (NC) where voters in 2006 approved the creation of a “unified government” in which the county government was given the additional powers of a city government. When the vote took place, the county contained part of Elizabeth City, but had no other cities. As a result of this vote, no cities can incorporate in Camden County and Elizabeth City cannot annex additional land there.

Since 1947, at least 145 votes have been held on proposals to consolidate city and county governments. Voters approved slightly fewer than one in five of the proposals (see [Table 2](#)). In the 1970s and 1980s, only 9 of 79 consolidation referenda (11%) resulted in a consolidated government. However, in the 2000s, 6 of 14 consolidation or unification referenda have been successful.

From 1990 to 2006, referenda on city-county consolidation were held in 13 states. In addition to the 10 mergers approved by voters in eight states (as shown

Table 1 Consolidated city-county governments in the United States

Year	City/county/state	2000 population
1947	Baton Rouge + East Baton Rouge, Louisiana	412,852
1952	Hampton + Elizabeth City County, Virginia	146,437
1957	Newport News + Warwick County, Virginia	180,150
1960	Chesapeake + South Norfolk Norfolk Co., Virginia	199,184
1962	Virginia Beach + Princess Anne County, Virginia	425,257
1962	Nashville + Davidson County, Tennessee	569,891
1967	Jacksonville + Duval County, Florida	778,879
1969	Juneau + Greater Juneau Borough, Alaska	30,711
1969	Carson City + Ormsby County, Nevada	52,457
1969	Indianapolis + Marion County, Indiana	860,454
1970	Columbus + Muscogee County, Georgia	186,291
1971	Sitka + Greater Sitka Borough, Alaska	8,835
1972	Lexington + Fayette County, Kentucky	260,512
1972	Suffolk + Nansemond County, Virginia	63,677
1975	Anchorage + Greater Anchorage Borough, Alaska	260,283
1976	Anaconda + Deer Lodge County, Missouri	9,417
1977	Butte + Silver Bow County, Montana	34,606
1984	Houma + Terrebone Parish, Louisiana	104,503
1988	Lynchburg + Moore County, Tennessee	5,740
1990	Athens + Clarke County, Georgia	101,489
1992	Yakutat + Yakutat Borough, Alaska	808
1992	Lafayette + Lafayette Parish, Louisiana	190,503
1995	August + Richmond County, Georgia	199,775
1997	Kansas City + Wyandotte County, Kansas	157,882
1998	Broomfield + Broomfield County, Colorado	38,272
2000	Louisville + Jefferson County, Kentucky	693,604
2000	Hartsville + Trousdale County, Tennessee	7,259
2002	Haines + Haines Borough, Alaska	2,392
2003	Cusseta + Chattahoochee, Georgia	14,882
2006	Camden County, North Carolina	6,885
2006	Georgetown + Quitman, Georgia	2,598

Note: Except for Indianapolis-Marion County and Broomfield-Broomfield County, the years are when the referendum on consolidation took place. For Indianapolis-Marion County, the date is the year when legislation creating the consolidated government was enacted. For Broomfield-Broomfield County, the date is the year that the creation of the combined city-county of Broomfield was approved in a state referendum. Camden County, North Carolina contains only part of one city. Its vote was to create a "unified government," giving its county government the status of both a city and county government, thereby precluding the incorporation of any new cities or annexation of any land to the existing city.

in Table 1), the proposal was rejected by voters in 27 referenda in 12 states: Georgia (6 referenda), Florida (3), Kentucky (3), Alaska (3), Iowa (2), North Carolina (2), Tennessee (2), New Mexico (2), Virginia (1), Washington (1), California (1), and Kansas (1).

Beyond the 145 referenda on city-county consolidation since World War II, many other efforts to consolidate cities and counties have been undertaken. For example, advocates promoted city-county

consolidation during the past decade in Texas (San Antonio-Bexar Co.), New York (Syracuse-Onondaga Co. and Buffalo-Erie Co.), Pennsylvania (Pittsburgh-Alleghany County), Wisconsin (Milwaukee-Milwaukee Co.), and Nebraska (Omaha-Douglas Co.); however, no votes on consolidation were held in those states.

Consolidation referenda are usually hard fought. Typically, support for consolidation comes from local newspapers, business owners, chambers of

Table 2 Total number of referenda on city-county consolidations and the number of referenda that passed by decade

Decade	Number of referenda	Number and percent of referenda that passed
1940–1949	3	1 (33)
1950–1959	9	2 (22)
1960–1969	20	6 (31)
1970–1979	49	7 (14)
1980–1989	27	2 (8)
1990–1999	23	4 (17)
2000–2006	14	6 (43)
Totals	145	28 (19)

commerce, and “good government” advocates influenced by the ideas of progressive movement. Opposition is most likely to come from government employees, unions, suburban dwellers who do not want to be part of a larger local government, and racial minorities.^[5]

Recent research by Suzanne Leland and Kurt Thurmaier suggests that successful efforts to consolidate city and county governments are the result of the proponent’s ability to frame the issue as one of economic development.^[6] They wrote:

...successful consolidation attempts involve civic elites who craft a vision of the community’s economic development, craft a restructured local government organization to effectively implement the economic development plan, and convince enough average citizens that the current structure is unable to achieve the economic vision they believe is key to their own economic future. (On page 481 of Ref.^[7].)

When referenda are held, double majorities are usually required for the consolidation to pass. That is, most merger proposal must be approved by a majority of voters living in each city to be consolidated and by a majority of voters who live outside the city or cities to be consolidated with the county government. The double majority requirement has been a difficult one for consolidation advocates to overcome.

IS GOVERNMENTAL CONSOLIDATION A GOOD IDEA?

The advocates and opponents of city-county consolidation disagree about its value. Often, they turn to

research on the topic and to experts to bolster their stances. When they do, they find substantial disagreement about the impacts of consolidation.

The Simple Arguments About Efficiency and Knowledgeable Citizens

For most of the twentieth century, pro-consolidation views dominated the academic discussion of the topic. Early on, proponents cited the founders of public administration, including Woodrow Wilson and Frank Goodnow, in favor of this reform.^[8] Later, in the 1930s and 1940s, leading public administration academics formulated and refined arguments for consolidation. These views reflected the progressive agenda that advocated such things as fewer elected officials, shorter ballots, and the professional city management.

The public administrationists and progressives argued that fragmentation of local governments is counterproductive. They maintained that it causes nearby local governments to be inefficient because they duplicate services and lose economies of size in service delivery. Also, they asserted that fragmentation causes confusion among citizens about which governments are providing them with different services, thus reducing their ability to monitor and influence policy makers. In addition, they contended that governmental fragmentation makes impossible the area-wide planning and action needed to address some of the most important programs facing a metropolitan area. The influence of this perspective can be seen in the recommendations for governmental consolidation and regionalism that came in the 1960s and early 1970s from the Committee for Economic Development, and the U.S. Advisory Commission on Intergovernmental Relations (ACIR).^[1,9]

Opposition to the public administration orthodoxy developed in the late 1960s. It was led by political economists with a public choice perspective on consolidation.^[4,10] The growing influence of this perspective was evident in 1987 when the ACIR issued a report heavily influenced by it.^[3] The perspective of the political economists is now the dominant one among academic researchers addressing consolidation, and it has been termed the “new orthodoxy” of consolidation.^[11]

Political economists reject the idea that local government fragmentation is harmful. They argue that the existence of many proximate local governments contributes to governmental efficiency. They maintain that fragmentation creates a type of market in which local governments compete to attract citizens by offering different packages of services and taxes.^[4,10] In this situation, people are better able to maximize their utility by moving to the local jurisdiction that has the

service and tax combination that best reflects what they want. Because different people have different preferences, they are better able to find a closer match for their preference when many competing local-government tax and service packages are available.

According to this perspective, competition among local governments for residents makes them more efficient than one large consolidated government, which functions as a monopolist influenced by budget-maximizing bureaucrats. Among other things, these multiple competing governments provide citizens with valuable information on the costs of services. Because people can compare the costs per unit of services in their cities with those of neighboring cities, they can make it more difficult for their local government to overcharge for them.

The More Complex Arguments About the Value of Fragmentation and Consolidation

In the 1990s, a group of “new consolidationists” shifted the debate from concern about the efficiency of local governments to concern about equity and economic development issues. They pointed out the social and racial problems of central cities and suggested consolidation as a good cure for them. These “new consolidationists” challenged the “new orthodoxy” of the public choice perspective of consolidation.

A leading proponent and pioneer of the new pro-consolidation perspective is David Rusk, a former mayor of Albuquerque (NM). He argues that inelastic cities contribute to problems that are at the heart of central city problems: poverty; economic, racial, and social segregation; and fiscal disparities.^[2] He noted that poor and disadvantaged citizens are confined to core cities and suggested the creation of merged city-county governments as one way to make metropolitan areas elastic, thereby better able to address the central city problems. Other “New Regionalists” also prescribed city-county consolidation as a way to address the social and economic development problems of metropolitan areas.

In another challenge to the “new orthodoxy,” Lowery’s critique found it weak in many regards, and he formulated a theory underlying the new case for consolidation.^[11] His critique suggested that Tiebout sorting includes not only choosing the best service and tax package but also maximizing race and class proximity. Thus, people tend to locate within governmental boundaries with people of similar race and class. As residents of small cities, they define their self-interest according to what happens within city boundaries, not the boundaries of the metropolitan areas. Thus, they view any effort to use taxes of their

city to help the ailing central city as redistribution, which they oppose.^[11]

Lowery suggested that consolidation is a way to broaden the self-interest perspectives of citizens and to turn decisions to assist central cities into allocation issues, which have lower transaction costs than reallocation decisions. With consolidation, according to Lowery, it is much easier to “enhance equity of social opportunities and promote economic development.”

Political economists have also been refining their arguments against city-county consolidation. They rely less on the Tiebout model of citizen movement among competing local governments to achieve efficiency in fragmented areas. Because Tiebout’s theory includes the assumption that moves within urban areas are costless, it has been subject to criticism. According to Parks and Oakerson, Tiebout’s sorting theory is not necessary to explain why fragmentation creates economic benefits.^[12] The benefits can be derived through a combination of citizen voice and public entrepreneurship. They wrote that voice is amplified and access is increased when the ratio of citizens to elected officials is low. Also, they maintained that by having a multiplicity of local government, many sources of entrepreneurial initiative exist.

Also, public choice advocates have rejected the idea that metropolitan areas are a bewildering mix of unrelated governments. They view metropolitan areas as well-functioning urban economies in which complex inter-relationships have been formed to insure that services are provided at the proper (that is, most efficient) levels. According to Parks and Oakerson, “Instead of textbook fragmentation, real metropolitan areas exhibit varied and complex organizations: a variety of small-, medium-, and large-provision units are linked to a variety of production units.”^[12] They point to intergovernmental compacts, privatization, contracting for service, special districts, and functional consolidations as creating a complex web of relationships that makes a metropolitan area a functioning entity.

What Is the Empirical Evidence About the Impacts of Consolidation?

Many anecdotal accounts of city-county consolidation and some research have found that city-county consolidations have contributed to governments that are more efficient. Nevertheless, the preponderance of research has supported the conclusion that greater fragmentation is associated with lower government costs in large metropolitan areas.^[4,5,13] However, these results do not necessarily extend to smaller and non-metropolitan areas, as shown by the research by Chicoine and Walzer, who found weak evidence that

having fewer governments in a county resulted in lower per capita costs.^[14]

Similarly, anecdotal evidence and limited research have supported the view of proconsolidation advocates that consolidation contributes to more effective government, improved economic development, and greater governmental equity. These assertions and limited research findings have been contested by several other researchers, including political economists. Some of this research has suggested that consolidation does not contribute to economic development or increased citizen participation.^[15]

CONCLUSION: THE FUTURE OF GOVERNMENTAL CONSOLIDATIONS

The recent success of consolidation efforts in Kansas City–Wyandotte County and Louisville–Jefferson County may encourage consolidation advocates elsewhere to try against long odds to consolidate their city and county governments. Even without those successes, it is likely that attempts to consolidate local governments would have continued.

The history of city–county consolidation has shown it to be an “evergreen issue.” In cities that have voted on city–county consolidation in the past, the issue may submerge, but it rarely departs. For example, the 1990 vote to merge Athens and Clarke County (Georgia) was the fourth referendum on the issue and the 2000 referendum in Louisville (Kentucky) was the third vote there.

Just as referenda are rarely the last word on city–county consolidation, the issue of whether governmental consolidation is good public policy is unlikely to be definitively resolved soon. Starting from different assumptions and holding different views of the world, public administration and political economy researchers will likely continue to conduct research with results that support opposing views of city–county consolidation.

Constitutional Constraints on Administrative Behavior in the United States

David H. Rosenbloom

INTRODUCTION

U.S. constitutional law currently places broad and substantial constraints on public administrative behavior at all levels of government. Since the 1950s, public administrators' interactions with clients and customers, coworkers, contractors, patients confined to public mental health facilities, prisoners, and individuals involved in street-level administrative regulation have become bounded by constitutional law.^[1-3] Federal court decisions based on a mix of statutory, constitutional, and common law have also made public administrators vulnerable to "constitutional tort" suits, that is, civil suits for money damages to redress their violations of individuals' constitutional rights. This entry explains the legal doctrines that established and defined present-day constitutional constraints on administrative behavior.

RELATIONSHIPS WITH CLIENTS OR CUSTOMERS

Prior to the 1950s, there were few effective constitutional constraints on public administrators' relationships with clients or customers. Recipients of governmental benefits were effectively unable to challenge the constitutionality of administrative conditions attached to welfare payments, public education, occupational licenses, or similar governmental "gratuities" or "largesse." Neither, for the most part, could they successfully use the Constitution's Equal Protection Clause to challenge the distribution of such benefits. Client and customer relationships were governed by the historic "doctrine of privilege." It held that the government had no constitutional duty or obligation to supply benefits, the client or customer accepted them voluntarily and without governmental coercion, the government was, therefore, largely free to establish the conditions on which the benefits could be received, and benefits might even be distributed in a discriminatory fashion under some circumstances.

The key to this approach was a distinction between rights and privileges. Rights are viewed as predating government and protected by the Constitution. In the Declaration of Independence's terms, they are bestowed by humans' "creator" and "unalienable." Privileges, by contrast, are interests established by the government, essentially on whatever terms it chooses. Because clients or customers have no constitutional right to the privileges offered by government, the Constitution was essentially irrelevant to the denial or withdrawal of benefits, no matter how dependent on them recipients may be. Famous examples included the denial of such benefits as public university education to conscientious objectors who would not join the Reserve Officers Training Corps, old-age assistance to a man who refused to live in conventional housing, a license to sell liquor to a man who exercised his privilege against self-incrimination, participation in extracurricular public high-school activities by married students, bartenders' licenses to women (other than the wives and daughters of male bar owners), and licenses to practice law and medicine on account of one's political beliefs.

The doctrine of privilege predated the development of the large-scale U.S. administrative state. In the 1950s and 1960s, it came under increasing criticism as a threat to the constitutional rights of an ever-growing number of clients and customers. By the 1970s, three doctrinal developments had rendered the distinction between rights and privileges meaningless: 1) modern equal protection doctrine; 2) "new property" theory; and 3) reinvigoration of unconstitutional conditions doctrine.

Equal Protection

First, the federal courts reinterpreted the Constitution's Equal Protection Clause. Logically, the doctrine of privilege should not have trumped the guarantee of equal protection of the laws. The fact that there is no right to government benefits does not support the conclusion that they may be offered to members of

one race but not of another. Modern equal protection doctrine, beginning most clearly with public education cases culminating in *Brown v. Board of Education*, prohibits the government from offering a privilege to some but not others, except in a fashion that is consonant with equal protection.^[4]

Today, equal protection has a three-tiered structure. The threshold issue is whether a government policy classifies people by some characteristic, such as race, gender, wealth, residency, or age. The classification may be implicit in a policy or its implementation, rather than explicitly stated in legislation or formal regulations. However, if there is no classification, there is no equal protection issue.

The top tier: Strict scrutiny

Classifications based on race or ethnicity are considered “suspect” because, in view of the nation’s history, it is likely that they will be used to disadvantage minorities. They are subject to strict judicial scrutiny and are constitutional only when narrowly tailored to promote a compelling governmental interest. A heavy burden of persuasion rests on the government, and the courts will not be deferential to its claims. These requirements apply whether the purpose of the classification is benign, as in the case of affirmative action, or invidious, as in the case of racial segregation.

The lower tier: Rational basis

Classifications based on factors that are not immutable, such as wealth and residency, are constitutional when they are rationally related to the achievement of a legitimate governmental purpose. The burden of persuasion is typically on the challenger, and the courts grant considerable deference to the government’s claims. This is called “mere rationality” or “rational basis” analysis. It also applies to classifications based on age. An exception occurs if a non-suspect classification directly interferes with the exercise of a protected constitutional right. For example, a residency requirement for welfare eligibility might abridge the constitutional right of indigents to travel and relocate across state lines. In such a case, the classification is subject to strict judicial scrutiny and must serve a compelling governmental interest in a way that is narrowly tailored or, possibly, by the means that are least restrictive of the protected constitutional rights involved.

The middle tier: Intermediate scrutiny

Classifications based on gender are “quasi-suspect” and face an intermediate test. They must be substantially related to the achievement of important governmental objectives. The courts may ask the

government to provide an “exceedingly persuasive” justification for such classifications, many of which are legacies of earlier practices and beliefs about gender differences that society no longer supports.

Contemporary equal protection doctrine constrains administrative behavior with respect to clients and customers in a wide range of circumstances. Most obviously, it prohibits racial and ethnic discrimination in public education, housing, welfare, health, recreation, occupational licensing, and other programs, except where the government can meet the compelling governmental interest and narrow tailoring tests under strict judicial scrutiny. Invidious discrimination is likely to be justified only under the most extraordinary circumstances, if ever. Benign or remedial racial and ethnic classifications, as in affirmative action, face the same test. To date, the Supreme Court has ruled that diversity in public university legal education is a compelling governmental interest that can be advanced in a narrowly tailored way by making race and ethnicity significant, but not determinative, factors in admissions decisions.^[5] Even though classifications based on gender do not require a compelling governmental interest and narrow tailoring, it is highly unlikely that invidious discrimination against females or males will be constitutional in client–customer relationships. Theoretically, the weaker standard for gender classifications makes it easier to justify affirmative action programs for women and girls than for minorities. However, in practice, there may be no real difference. By contrast, classifications based on other factors, such as age, will most likely be constitutional unless they interfere with the exercise of another protected constitutional right.

Procedural Due Process: The “New Property”

A second doctrinal change contributing to the demise of the doctrine of privilege is called “new property” theory. This approach developed in the 1960s and 1970s. It treats individuals’ governmental benefits as their own property. As such, they are covered by the Due Process Clauses of the Fifth and Fourteenth Amendments, which are aimed at guaranteeing fair procedures and promoting rational decision making. Specifically, these clauses prohibit the deprivation of “life, liberty, or property, without due process of law.” Consequently, once they are defined as a form of property, welfare benefits, public housing, public education, various occupational and other licenses, and other benefits cannot be withheld or terminated (during the period for which they were offered) without a fair procedure.

Procedural due process has a fluid structure. It requires a balancing of three factors: 1) the individual’s

interest in the benefit and/or the severity of the deprivation at issue; 2) the risk that procedure in place, if any, will result in an erroneous decision *and* the probable value of additional procedures in reducing errors; and 3) the government's administrative and financial interests in not using additional or alternative procedures. The underlying assumption in this formula is that, in general, the more elaborate the procedures, the lower the risk of error. Once established by a statute or administrative regulation, a new property interest can be withheld or terminated only in consonance with constitutional due process.

The application of procedural due process is subjective. One must weigh both the individual and the governmental interests. Typically, two issues arise. First, whether the client is entitled to procedural due process, prior to the termination of a benefit during the term for which it was offered. Recipients of means-tested welfare benefits, which may be vital to their survival or ability to use post-termination procedures, generally enjoy a procedural due process right to some pretermination protection against erroneous administrative decisions. An exception exists when there is no factual dispute about their continuing eligibility.

The second issue is how elaborate the procedures required by due process must be. They can range from highly informal notice and opportunity to respond, to a formal response in writing only, to the rudiments of a non-jury judicial trial with a right to counsel, presentation of evidence and witnesses, confrontation and cross-examination of adverse witnesses, a written transcript, a decision by an impartial decision maker, and a right to appeal.^[6-8] In federal administrative law, an impartial decision maker is defined as one who does not have "an irrevocably closed mind." More generally, impartiality prevents those who investigated the case from making the final decision. Sometimes pre- and post-termination requirements are linked. For example, because elaborate post-termination procedures are available to social security disability recipients, only limited procedure is required before these non-means-tested benefits are cut off.

The impact of new property doctrine on administration depends on the specific context. Pre- or post-termination hearings became common in decisions regarding the termination of welfare and disability benefits and occupational licenses. Suspensions and expulsions from public schools are also controlled by procedural due process. It is important to remember that when benefits terminate because they were offered for a fixed term or the recipients have aged, moved, married, or otherwise changed their eligibility status, procedural due process may require nothing more than notice, if that. However, if there is a factual question about the recipient's continuing eligibility, more elaborate procedure may be required.

Unconstitutional Conditions

Reinvigoration of the "unconstitutional conditions" doctrine was the third constitutional change to undercut the doctrine of privilege. The conditions attached to governmental benefits sometimes interfere with clients' and customers' constitutional rights. For instance, a state might mandate that applicants for unemployment compensation be available for work on Saturday despite their Sabbatarian religious beliefs or that public school students recite prayers or the pledge of allegiance to the flag. The unconstitutional conditions doctrine seeks to limit the government's ability to use benefits as leverage for regulating behavior that it could not reach directly without violating individuals' constitutional rights. For instance, under the unconstitutional conditions doctrine, American governments, which lack the power to establish religion directly, cannot do so indirectly through the manipulation of benefits.

The problem public administrators and lawmakers face is knowing which conditions attached to benefits will be adjudged unconstitutional. Essentially, the courts apply a two-part test. As in the case of procedural due process, a good deal of subjectivity is involved. Specific requirements vary with the nature of the benefit and type of condition. Conditions that gratuitously infringe on protected rights, by failing to serve a significant governmental purpose or by prohibiting more than necessary to achieve a legitimate or compelling public interest, are likely to be unconstitutional. Narrowly tailored conditions involving freedom of speech, association, and religion must generally promote at least an important governmental interest. Conditions implicating Fourth Amendment privacy must be reasonable. Under the Fifth Amendment's "Takings Clause," conditions attached to building permits must be roughly proportional to the impact the proposed development will have on legitimate governmental interests, such as traffic congestion.

Taken together, contemporary equal protection, new property theory, and the unconstitutional conditions doctrine bring constitutional law directly into the relationships between public administrators and their clients and customers. They complicate public administration by broadening the set of values that administrators and programs must protect and, sometimes, by requiring elaborate procedure. Procedural due process may not be an efficient process. Narrow tailoring may add expense to programs. The application of constitutional constraints to the distribution of government benefits strengthens the role of courts and judges in this area of public administration, most notably with regard to remedying systematic violations of equal protection, as in desegregating public schools.

PUBLIC PERSONNEL ADMINISTRATION

The doctrine of privilege also applied to public employment. Until change began in the 1950s, a public sector job was considered a benefit or gratuity. Having voluntarily accepted it, public employees could not claim that conditions imposed violated their constitutional rights. As in the case of benefits to clients and customers, racial and gender discrimination in public employment was not controlled by the Equal Protection Clause. Until the 1950s, individuals could be denied public employment or dismissed from it essentially for any reason or no reason at all, including their speech, beliefs, religious practices, reading habits, race, gender, or membership in unions, civil rights, and other organizations.

Cases involving public employment contributed substantially to the demise of the doctrine of privilege. Constitutional constraints became important to public personnel administration as equal protection was applied to public employment, civil service jobs were considered part of the new property, and the unconditional conditions doctrine was invoked to protect public employees' First Amendment rights. However, the constitutional doctrine that constrains public sector human resources management differs from that pertaining to clients and customers.

Constitutional rights within the framework of public employment are now assessed through a "public service model." Its core premise is that the administrative values of efficiency and effectiveness are more important to governments when they act as employers than when they seek to regulate the behavior of ordinary citizens.^[9] Government, like any employer, needs greater authority over its employees than it can exercise over its clients, customers, or the general public. But there are also limits to that authority.

The public service model balances three considerations. First is the interest of the employees in exercising their constitutional rights, that is, in being free of governmental controls. Second is the government's interest in achieving some important purpose as an employer. Third is the public's interest in the way government and public administration operate. The key point in the public service model is that the public's interest may coincide with either that of the employee or that of the government. For example, in the realm of free speech, the public has a clear interest in affording strong constitutional protection to whistle-blowing by public employees. The public is better able to assess governmental performance when public employees can freely expose illegality, gross waste, fraud, abuse, and specific and immediate dangers to public health or safety. In contrast, the public has only a minimal interest, if any, in public employees' partisan campaign speeches, routine office

gossiping, or grouching about politicians and administrative higher-ups. Under the public service model, whistle-blower speech is strongly protected, whereas partisan speech and speech that is of minimal or no public concern are not.^[10-12]

The same kind of balancing applies to public employees' free exercise of religion and association, as well as to their Fourth Amendment privacy rights and guarantee of equal protection of the laws. In assessing constraints on personnel management in these contexts, one always considers the individual's interest in exercising or retaining protected rights, the government's interests that could justify abridgments, and the public's interest. It is important that public personnelists, managers, and employees bear in mind that the governmental interest, although often stated as serving the taxpayers, is not necessarily synonymous with the public interest. Even in the context of public employment, the government's interest in cost-effective administration may not justify infringements on constitutionally protected rights. If there is no clear public interest one way or the other, then the balance is simply between the interests of the employee and the government. The employee will sometimes win because, despite the importance of cost-effective administration, it is not always sufficient to justify interference with protected constitutional rights.

First Amendment Rights

Public employees enjoy broad First Amendment rights under the public service model. The major limitations on their freedom of speech are that, to be constitutionally protected, expressive activity must be on a matter of public concern and it cannot be part of a specific work product or assignment, such as a report or public address.^[13] Additionally, speech that is part of a partisan political campaign may be banned.^[11] Disruptive remarks on matters of private concern only are not protected because they serve no public interest. Restrictions on the partisan political activity of public employees are constitutionally justified by the public interests in administrative impartiality and efficiency, as well as by the protection they afford government workers against being coerced by political appointees and supervisors, to support political parties and candidates.

Public employees' speech and other expressive activity on matters of public concern are most vulnerable to adverse actions under two conditions. First, speech made pursuant to an employee's official duties is not constitutionally protected.^[13] Second, speech may trigger discipline when it impairs discipline or harmony in the workplace, it jeopardizes close working relationships, interferes with normal operations,

or detracts from employees' ability to do their jobs. In balancing the interests of the government, employee, and public, attention must be paid to the nature of the employee's position in the organization. Identical remarks by those at the top and bottom of an organizational hierarchy may be treated differently. When disciplining employees for their off-the-job remarks or other protected activities, the government should be able to show a nexus between its significant interests as an employer and the conduct involved.

The public service model also broadly protects employees' freedom of association and religious freedom. Restrictions on these freedoms have to be justified by the balance among the interests of the employee, public employer, and public. Constitutional law extends extensive protection to employee's freedom of association on the premise that membership alone is not a proxy for behavior. Consequently, employees may join labor unions, employee associations, offensive groups such as the Ku Klux Klan, and even subversive organizations. Exceptions are permissible for categories of employees whose membership in particular organizations would significantly harm the employer's or public's interests. For instance, supervisors and managers can be banned from joining labor unions representing rank-and-file employees, because such membership might conflict with their hierarchical responsibilities. Employees also have the right not to join organizations and, consequently, union shop and maintenance of union membership labor agreements are unconstitutional in the public sector. Since the late 1970s, public employees' freedom of association has been interpreted to make job actions, based on political partisanship, unconstitutional unless the government can show that party affiliation is related to effective job performance.

The parameters of public employees' religious freedom are less clear. The governmental employer cannot coerce employees to engage in prayer or other religious activity. Neither can it gratuitously restrict their religious expression or behavior. Because discrimination based on religion is prohibited by federal equal employment opportunity law, a public employee is ordinarily allowed to wear religious jewelry or headgear, even if other workers find it objectionable. By contrast, restrictions on religious activity might be justified, when overt religious proselytizing or vocal praying at work is disruptive or otherwise interferes with the employer's legitimate interests in workplace harmony and cost effectiveness.

Fourth Amendment Privacy

Public employees retain protections against unreasonable searches and seizures in the public workplace.

The threshold question is whether the employee has a reasonable expectation of privacy under the circumstances. That is, an expectation of privacy that society is prepared to support (according to federal judges). In the absence of such an expectation, public employers are free to search an employee's workspace, desk, files, computer, and so forth. Where there is a reasonable expectation of privacy, the governmental search must be reasonable in its inception and scope. Employees have a reasonable expectation of privacy in their body fluids, but suspicionless drug testing is constitutionally permissible when it reasonably promotes national security, law enforcement, or public safety.

Procedural Due Process

Although a counter trend developed in the 1990s and early 2000s, civil service systems typically provide public employees with new property rights in their positions. Consequently, procedural due process protects them against arbitrary, capricious, or abusive dismissal or demotion. Pretermination notice and opportunity to respond are generally required, as are more elaborate post-termination procedures. Depending on the circumstances, public employers may not be required to offer any procedural due process prior to suspending an employee without pay for wrongdoing. However, the employee should be offered a hearing of some kind within a reasonable time after the suspension takes effect. For the most part, the constitutional requirements for public employees' procedural due process are now written into civil service laws and regulations. However, once a new property right in public employment is created by the government, its termination or diminution is controlled by constitutional, rather than statutory law. Where public employees do not have civil service or tenured status, adverse actions may be "at will" only insofar as they do not violate First Amendment, Fourth Amendment, equal protection, or other constitutional rights.

Equal Protection

The three-tiered equal protection analysis previously discussed applies to public employees as well as to clients and customers. Racial and ethnic classifications, whether benign or invidious, are subject to strict scrutiny. Thus far, the Supreme Court has not held that promoting workforce diversity is a compelling governmental interest. It has permitted benign racial classifications only as a remedy for past, proven, and egregious violations of equal protection, though, logically, the court's language accepting diversity in higher education as a compelling governmental interest seems applicable to civil service jobs as well.^[5] All racial or

ethnic classifications must be narrowly tailored. That is, they must 1) be efficacious relative to alternative remedies that avoid such classifications (such as fining a jurisdiction for violations of equal employment opportunity); 2) have a clear and logical stopping point in terms of time elapsed or policy goal achieved; 3) be demographically proportionate; 4) contain waiver provisions so that the government is never forced to hire someone who is unqualified; 5) not unduly burden the employment interests of nonminority employees; and 6) provide individualized consideration of each qualified applicant.

Residency and age requirements are subject to rational basis analysis. They will be constitutional if they are rationally related to the achievement of a legitimate governmental purpose. Gender-based classifications face a higher standard—they must be substantially related to the achievement of important governmental purposes.

RELATIONSHIPS WITH CONTRACTORS

Governments also face constitutional constraints when dealing with contractors. Some of these are well settled. Governments cannot engage in invidious racial, ethnic, or gender discrimination when contracting out. Contracts that establish new property interests cannot be terminated without procedural due process. In the 1990s, the Supreme Court strengthened two additional types of constraints.

First, the court unequivocally held that benign racial and ethnic classifications in governmental contracting are subject to strict scrutiny. They must serve a compelling governmental interest in a narrowly tailored fashion. This restricted the use of minority business set aside and other preferences. Even though the constitutional test for gender classifications is weaker, preferences for women-owned businesses will probably face substantial limitations, if such litigation reaches the Supreme Court.

Second, the court made it clear that contractors and those engaged in pre-existing commercial relationships with governments, such as firms on a tow truck rotation list, retain First Amendment rights. Using unconstitutional conditions analysis, the court held that the Constitution protects contractors' public criticism of a government and opposition to its officials. Essentially, the same constitutional test that applies to public employees' speech is used to determine the free speech rights of contractors and others engaged in ongoing business relationships with government. A government can terminate its commercial relationship with such parties in response to their speech, only if it can show that, on balance, such action is justified

by the speech's detrimental impact on its ability to deliver public services.^[14]

THE MANAGEMENT OF PATIENTS IN PUBLIC MENTAL HEALTH FACILITIES

Since the early 1970s, constitutional law has required that patients confined to public mental health facilities be afforded treatment. Earlier, they were often "warehoused" indefinitely or otherwise inadequately treated. In *Wyatt v. Stickney*, a federal district court held that confining such patients without treatment constitutes a violation of the right to liberty under the Fourteenth Amendment.^[15] Although the decision applied directly only to the Alabama mental health system, its logic was soon adopted nationwide.

The constitutional right to treatment was eventually defined broadly to include reasonable care and safety, reasonably non-restrictive confinement conditions, and individualized treatment (or training for the mentally disabled). Implementation requires a humane physical and psychological environment, as well as adequate staffing. In practice, this may require far-reaching architectural and medical reforms. The *Wyatt* court eventually required Alabama either to release patients or to provide the following: protection of patients' right to wear their own clothes and to have physical exercise and freedom of religious worship; no more than six patients per room; no single room with less than 100 ft²; at least one toilet for each eight patients and one shower or tub for each 15 patients; not less than 50 ft² per person in the dayroom; at least 10 ft² per person in the dining room; a temperature range between 68°F and 83°F; and various per-patient staffing ratios for professionals, clerical workers, and other staff.

Although judicial involvement in public mental health care was sometimes characterized as interference, eventually the American Psychiatric Association supported the right to treatment. Along with other factors, including better psychoactive drugs, crowding was reduced through deinstitutionalization and shorter stays, and the overall conditions in public mental health facilities improved substantially. However, deinstitutionalization also fostered more homelessness among the mentally ill.^[16]

PRISON MANAGEMENT

Since the 1970s, the treatment of prisoners has also been thoroughly constitutionalized. The Eighth Amendment prohibition of cruel and unusual punishment was reinterpreted to apply to the conditions of confinement, rather than the sentence only. This required prison reforms in more than 40 states to

reduce overcrowding, provide adequate medical care and safety, and guarantee inmates at least a minimal level of nutrition, hygiene, and civilized life's other necessities. The scope of what is prohibited by the Eighth Amendment changes as society progresses and standards of decency evolve. For instance, in the 1990s, prisoners gained the right to challenge subjection to second-hand tobacco smoke, when it poses a risk of serious harm due to personal respiratory or other health problems.

In addition to Eighth Amendment protections, prisoners have a right to procedural due process, when proposed discipline creates extraordinary hardships within the framework of normal prison life. Similarly, within the confines of what incarceration requires in practice, they have the right to free exercise of religion and to marry. The general test is whether restrictions on the prisoners' constitutional rights serve legitimate penological interests, including their impact on guards and other inmates. Prison administration has become so thoroughly infused with constitutional concerns that some prison systems engage in "constitutional audits" to assure their compliance with the latest judicial decisions.

STREET-LEVEL REGULATORY ENCOUNTERS

Public employees whose jobs require constant face-to-face regulatory interaction with the public are often called "street-level bureaucrats." The term includes police, social workers, public school teachers, public health workers, health and safety inspectors, and others who tend to work in the absence of close proximate supervision, have a great deal of discretion in dealing with the public, are largely self-reporting, and are often in a position to have a great positive or negative impact on the individuals with whom they deal. It is also common for street-level bureaucrats to work with heavy caseloads and inadequate resources. Their work environment may be charged with physical and/or psychological threats.

The Fourth Amendment and Equal Protection Clause are the most relevant constitutional constraints on street-level bureaucrats' behavior. However, these controls are loose and subject to evasion.

Fourth Amendment Constraints

Fourth Amendment law is notoriously uneven and fact specific in its application. As noted earlier, it only applies to situations in which there is a reasonable expectation of privacy. The courts treat that expectation as a continuum. On one end, individuals who are in their own homes with the windows and doors

closed and curtains drawn have a great expectation of privacy. On the other, the same individuals would have a minimal expectation of privacy in their baggage when seeking to board a scheduled commercial airplane at a U.S. airport. In between, there are many gradations. In addition, some individuals have reduced Fourth Amendment protections due to their special relationship with an administrative function and its personnel. For example, public school administrators have greater leeway to search students because the schools have special custodial and tutelary responsibilities.

A distinction is usually drawn between law enforcement searches and administrative inspections. Whenever practicable, the Fourth Amendment requires law enforcement officers to seek a warrant from a judge, magistrate, or other judicial official. The warrant is issued on probable cause, which essentially means that there is specific evidence that a violation of law is impending or may exist. When time or other considerations make obtaining a warrant impractical, law enforcement agents can proceed on probable cause alone. Administrative inspections of non-pervasively regulated businesses may also require warrants. However, it is not necessary to show probable cause, as these may be issued when reasonably necessary for the enforcement of the regulatory statute involved. Administrative searches involving special relationships or needs, such as public school discipline, are generally governed by a reasonableness standard.

The constraints on street-level administration generated by this framework often appear inconsistent and, sometimes, close to non-existent. For instance, a federal Occupational Safety and Health Administration (OSHA) inspector may need a warrant to inspect a workplace, depending in part on how open the facility, or a section of it, is to the public. Similarly, a public hospital cannot engage in a law enforcement search of patients' bodily fluids without a warrant or their consent, although it apparently can draw the same fluids for diagnostic medical reasons without Fourth Amendment restriction.^[17] At the same time that an OSHA inspector and public health worker may need a warrant, an individual can be arrested for any traffic infraction, however minor, and consequently subject to a legitimate personal and vehicle search. The Supreme Court has eschewed all inquiry into whether traffic stops or arrests following them are merely pretexts used by the police to search individuals and their vehicles. Even arrest for a non-jailable offense, such as not wearing a seat belt, is permitted.^[18,19]

Equal Protection Constraints

Equal protection constraints on street-level bureaucrats are less complex than Fourth Amendment

requirements, but also subject to circumvention. The threshold question for equal protection analysis is whether a government or its employees classify individuals by some social characteristic such as race, age, or wealth. If there is no classification, there is no equal protection issue. A “classification of one” is cognizable under equal protection, but unfair treatment of particular individuals is typically litigated under procedural due process protection against arbitrary or capricious administrative decision making.^[20]

The main problem for individuals who would challenge street-level personnel’s behavior on equal protection grounds is that the burden of persuasion rests on the private party to demonstrate that a government or its employees have explicitly or implicitly created a classification. Explicit invidious racial, ethnic, or gender classifications are highly unusual in contemporary public administration. Implicit classifications, based on these social characteristics, may be inferred from patterns of administrative behavior. However, establishing their existence to a court’s satisfaction is difficult. This is why the Equal Protection Clause has been relatively ineffective in combating racial and ethnic profiling by law enforcement agents when there is no written or verbal evidence. Unless profiling is the only plausible explanation for the administrative behavior at issue, it may be impossible to show that an implicit classification exists. Of course, equal protection is a more effective constraint against street-level behavior that follows directly from racist, ethnically derogatory, or sexist statements.

PUBLIC ADMINISTRATORS’ LIABILITY FOR CONSTITUTIONAL TORTS

There is often a gap between formal constitutional requirements and actual administrative practice. Constitutional law may be unclear or poorly communicated to administrators. Sometimes, it is highly subjective or requires elaborate balancing of multiple factors. Specific constraints may seem counterintuitive to administrators or impractical due to scarce resources, including time. Furthermore, not everyone whose constitutional rights are violated has either the incentive or the wherewithal to sue the government or its employees for redress.

In a series of decisions crystallizing in the 1980s, the Supreme Court strengthened the application of constitutional constraints on administrative behavior, by reinvigorating the law of “constitutional torts.” The court made it far easier for aggrieved individuals to sue public administrators personally in federal court for money damages, for violations of their constitutional rights. It reasoned that facilitating constitutional tort suits serves both to deter breaches of

constitutional law and to compensate victims. The current standard for administrators’ liability for violating constitutional rights requires that they personally factor knowledge of constitutional constraints into their decision making.

Since 1982, most American public administrators potentially have been personally liable for money damages when their conduct violates “clearly established statutory or constitutional rights of which a reasonable person would have known.”^[21] Under this standard, knowledge of constitutional law becomes a matter of job competence. In the Supreme Court’s words: “[A] reasonably competent public official should know the law governing his conduct.”^[21] An exception is that public administrators cannot be sued for committing constitutional torts while engaged in adjudicatory or legislative functions. There are also some technical differences in how local, state, and federal employees may be sued. However, the vast majority of public administrators are subject to suit, and constitutional torts produce a considerable amount of litigation. Municipalities and their agencies are also vulnerable to such suits, when their policies directly cause violations of individuals’ constitutional rights. Under limited circumstances, they can also be sued for failure to train their employees to protect constitutional rights.

CONCLUSION

During the second half of the twentieth century, the federal courts, often led by the Supreme Court, revolutionized the application of constitutional constraints to administrative behavior in the United States. Constitutional law became central to administrative decisions and operations regarding clients or customers, public personnel systems, outsourcing, the treatment of patients in public mental health facilities, incarceration, and the exercise of regulatory authority in street-level encounters. The courts also vastly strengthened the opportunity for aggrieved individuals to vindicate their newfound rights through constitutional tort suits. Perhaps most important, the federal judiciary now expects public administrators at all levels of government to follow the development of constitutional law, to know how it bears upon their official functions, and to understand that obeying it is a central element of job competence.

Constitutional Constraints on the Administrations of Public Policy

Matthew Woessner

*Department of Public Affairs, Pennsylvania State University at Harrisburg,
Middletown, Pennsylvania, U.S.A.*

INTRODUCTION

The Constitution of the United States, long celebrated as the greatest political accomplishment of the Enlightenment, is often regarded with less enthusiasm by proponents of strong and efficient public administration. Despite its many accomplishments, this political contract was primarily an instrument of decentralization, designed to frustrate those who might abuse the power of a strong central government. To the extent that the Founding Fathers constrained the new government, they also placed burdens upon servants of the public good by creating a complex chain of political command, establishing restrictive boundaries on federal power, and creating limits on government use of private property. Ultimately, the primary purpose of the Constitution was to establish domestic tranquility without unnecessarily depriving citizens of their basic liberties. The efficiency of public administration was secondary to concerns over a return to monarchy.

To allay concerns that a new central government would become too powerful and overrun the autonomy of the states, the Founders placed specific limitations on federal authority in a deliberate attempt to keep it at bay. From a conceptual standpoint, these limitations are often described in terms of *organizational*, *jurisdictional*, and *property constraints*.

From an organizational standpoint, administrators must know from whom they are taking orders. In the American context, the answer to this question turns out to be quite complex. Further, administrators must be aware of the jurisdictional limitations of their powers under a federal system of shared political authority. The fact that an organizational decree comes from the national government does not, in and of itself, guarantee that the directive is legitimate. The founders designed a layered system of authority in which the state and national governments are given jurisdiction over specific segments of American affairs. Understanding how this has been interpreted will influence how and when administrators choose to act. Finally, the power to act is often tempered by constitutional guarantees of due process and just compensation.

So even with clear directives and unambiguous jurisdiction, administrators must occasionally bow to the rights of property. Although these limitations have varied remarkably over the last century, they remain an important consideration for any scholar of public administration.

ORGANIZATIONAL CONSTRAINTS

Organizational constraints refer to the inherent difficulties of public administration, where the chief bureaucratic officers answer to more than one central authority. In contrast to the classic bureaucratic model, the heads of government agencies do not report exclusively to one individual. Rather, department heads are, themselves, responsible to a large number of different authorities, including but not limited to, the President of the United States, the Speaker of the House, the Majority Leader of the Senate, members of governing committees, subcommittees, and the Congressional membership in general. While it is true that the President has an inordinate degree of influence over the goals and direction of high-level public administrators, they are, nonetheless, compelled to consider the interests of legislators.^[1]

The myth of the presidential bureaucracy stems largely from the fact that department heads serve at the pleasure of the president. To obtain a post at the head of a large government agency, an aspiring cabinet secretary must demonstrate that his appointment will ultimately serve the interests of the chief executive. Given the president's power to terminate top-level appointments, the tenure of a department head will last only as long as he can continue to demonstrate his usefulness. However strong a motivating factor, the power to dismiss high-ranking administrators does not guarantee their loyalty. Beyond the power of appointment, administrators look to Congress to meet their most basic needs, including the confirmation of executive appointments, relevant statutory authorities, and agency funding.^[2] To the extent that public administrators are dependent upon the legislature, agency heads will look to Congress and the President for oversight.

From an organizational standpoint, the job of a public administrator is further complicated by the responsibility to act within the bounds established by the Federal Judiciary. Although the courts do not traditionally make demands on public administrators, the process of statutory interpretation and judicial review forces judges to examine the legal basis for the actions taken at the behest of the political branches. Whenever government takes actions deemed contrary to the letter of the law or the spirit of the Constitution, administrators alter their policies in such a way as to satisfy the concerns of the courts.^[3]

While useful in preventing despotism, the principles of “checks and balances” and the “separation of powers” are generally at odds with classical notions of bureaucratic organization. As a result, nimble public administrators must be capable of pursuing some public good without a single clearly-defined goal from any of the competing branches.

JURISDICTIONAL CONSTRAINTS

Jurisdictional constraints refer to the constitutional limitations placed on federal power in order to prevent the national government from infringing upon the authority traditionally left to states. Before exercising a power established by the legislature, a public administrator must know that the given authority does not conflict with an existing power granted exclusively to the state government or to the people. To do so might risk a lengthy legal battle and, ultimately, repudiation by the judiciary.

From an eighteenth century perspective, concerns over *jurisdictional constraints* were paramount in the minds of public administration, as the newly established national government was granted a narrow list of specific powers meant to provide for domestic security and to promote economic integration. In the execution of administrative power, bureaucrats looked carefully to the enumerated powers listed in Article I, Section 8, of the U.S. Constitution, as a roadmap of legitimate federal authority.

Early battles over the power of the federal government and the scope of its administrative control turned on the last line of Section 8, known commonly as the elastic clause. “The Congress shall have Power To . . . make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof.” For, while the Founders methodically listed the powers of the new central authority, this final directive would seem to imply that Congress could move beyond its narrowly defined

charter, so as to satisfy one or more of its aforementioned responsibilities.

Early on, the federal courts were receptive to arguments in favor of an expansive federal power. In *McCulloch v. Maryland*,^[4] the Supreme Court was asked to determine whether the charter of the Second Bank of the United States was constitutionally permissible under the powers outlined in Article I. According to its detractors, the federal government lacked the specific authority to charter banks and, therefore, had exceeded its constitutional mandate. Attorneys representing the United States argued that, under the elastic clause, the government was within its right to establish financial institutions for the purpose of strengthening commerce and promoting the general welfare. Writing for a unanimous court, Chief Justice John Marshall argued:

Among the enumerated powers, we do not find that of establishing a bank or creating a corporation. But there is no phrase in the instrument which, like the articles of confederation, excludes incidental or implied powers; and which requires everything granted shall be expressly and minutely detailed . . . After the most deliberate consideration, it is the unanimous and decided opinion of this court that the act to incorporate a bank of the United States is a law made in pursuance of the constitution and is part of the supreme law of the land.

Accordingly, in the exercise of federal authority, officials would, henceforth, not be limited to the enumerated powers listed in Article I, Section 8. Rather, Congress could expand the powers of the federal government to include any influence roughly tied to its responsibility, apart from those specifically forbidden by the Constitution.

Despite the Supreme Court’s recognition of implied federal power in *McCulloch v. Maryland*, the states managed to retain an enormous degree of autonomy, particularly in terms of their domestic affairs. Early attempts to regulate or outlaw child labor were met with stiff resistance by a court predisposed to favor a state’s right to self-determination. In *Hammer v. Dagenhart*,^[5] a private citizen challenged the right of the federal government to set minimum age standards under the Federal Child Labor Act of 1915. The Supreme Court ultimately upheld the decision of the district court, which struck down the act as a usurpation of state authority. Four years later, in *Bailey v. Drexel Furniture Co.* (1922), the Supreme Court would strike down attempts to regulate child labor, this time through taxation. While the court was willing to acknowledge Congress’s implied powers under the elastic clause, it was, as yet, unwilling to let loose that authority, so long as it clashed with the responsibilities

of the states. This, too, would change with the further integration of state commerce and the onset of a national economic emergency in the Great Depression.

The great turning point in the battle over the scope of federal power would begin in 1932 with the election of Franklin D. Roosevelt as president. With the onset of the Depression, the Roosevelt Administration carried a popular mandate to exercise federal authority over the faltering agriculture and manufacturing sectors in an effort to jump-start the national economy. However, the federal judiciary, still accustomed to seeing economic regulations as a state prerogative, struck down a vast majority of Roosevelt's New Deal programs, arguing that congressional regulations of state commerce must be substantially related to matters of commerce between the several states. With the appointment of sympathetic justices and a threat to pack the court, the judiciary gradually relented. Arguing in *National Labor Relations Board v. Jones & Laughlin Steel Corporation*,^[6] the Supreme Court conceded that, in matters of commerce, it is not sufficient that states be granted autonomy over domestic manufacturing, as disputes within those industries could affect the nation as a whole:

When industries organize themselves on a national scale, making their relation to interstate commerce the dominate factor in their activities, how can it be maintained that their industrial relations constitutes a forbidden field into which Congress many not enter when it is necessary to protect interstate commerce from paralyzing consequences of industrial war?

In the decisions that would follow, the Supreme Court gradually expanded the power of congressional administration, using its constitutional authority over interstate commerce as the justification for intervening in any number of state-related activities.

From a practical standpoint, the importance of federal jurisdictional considerations has declined quite dramatically with the growth of a modern interstate economy. Since the court battles of the mid-1930s, the judiciary has scarcely challenged the power of federal officials to regulate state functions under the interstate commerce clause. In one notable exception, *United States v. Lopez*,^[7] the Supreme Court upheld a lower court decision to strike down the Gun-Free School Zone Act of 1990. Under the act, individuals were prohibited from knowingly possessing firearms within a "school zone." Stemming from an earlier decision, the U.S. Congress had grown quite accustomed to asserting its authority in matters relating to the public good under the assertion that it was regulating commerce. This case, however, provided a more difficult situation.

Congress sought to regulate local crime and education, traditionally matters of state control. In addition, the act scarcely provided any evidence that gun possession on school property was in any way related to matters of interstate commerce. Although legal scholars debate the long-term implication of *Lopez*, in striking down the law, the Supreme Court did, if only modestly, reassert the independence of state power and limit Congress' authority to regulate its internal functions.

In the modern context, the constraints of federalism are far less potent than they were when the nation was founded. Nevertheless, under the American constitutional system, administrators of public policy must come to recognize that all federal power operates with specified legal boundaries. To the extent that Congress authorizes the use of federal power outside of long-established precedent, administrators will face a daunting string of court challenges, whether or not the policies enjoy broad public support.

PROPERTY CONSTRAINTS

Property constraints refer to constitutional limitations placed on the government's administration of private resources.

It has been argued that the preservation of property rights was a major motivating factor for the American Revolution. Consequently, safeguards against unreasonable intrusion on privately held resources would eventually become a hallmark of the newfound government; buried inconspicuously within the Constitution's Fifth Amendment:

No person shall be held to answer for a capital, or other-wise infamous crime, unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the Militia, when in actual service in time of War or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; *nor shall private property be taken for public use, with-out just compensation.*

Originally, the protections granted under the Fifth Amendment were narrow in scope and application. The meaning, as determined by early American courts, was to prevent the outright confiscation of land by agents of the federal government. Early attempts to broaden the protection to include the mere devastation of property were met with stiff judicial resistance.^[8]

From an administrative perspective, these early constraints were of little consequence in the day-to-day

execution of government policies. The practice of eminent domain, while long established in common law, was rarely ever invoked. The true significance of the Constitution's *property constraints* would not become apparent until the Fifth Amendment protections were expanded beyond the physical occupation of privately held lands.

One of the first successful extensions of the Constitution's property protections came amidst preparation for the Second World War. In *United States v. Causby*,^[9] a family of chicken farmers brought suit against the federal government, arguing that a newly reconstituted Air Force base had destroyed their poultry business and ruined their living space. The vibrations from the airstrip and the sound from the low-flying bombers so upset the livestock that the Causby's could not continue to raise healthy chickens. Relying on traditional notions of eminent domain, the government argued that, absent the physical occupation of their land, the air traffic alone did not justify compensation. The Supreme Court disagreed, arguing that the deprivation of one's livelihood might, under the appropriate conditions, require government compensation. In this case, the restitution was appropriate.

More recently, the courts have come to view the Constitution's *property constraints* in even broader terms, extending compensation for some environmental and zoning regulations. In *Lucas v. South Carolina Coastal Council*,^[10] an oceanfront property owner brought suit against his state for its application of the Beachfront Management Act. Under the regulations, the development of his oceanfront properties would be prohibited. Arguing that the regulations were passed after he had acquired the properties, Lucas suggested that the state legislature had rendered his land worthless. Accordingly, if the state's interests in preserving the land were valid, he must be compensated. The Supreme Court ultimately agreed, ordering the state to provide for the substantial economic damage done to the property as a result of the restrictions.

The overall importance of the Constitution's property constraints is tempered by the prescribed remedy. Even in the most recent rulings, the judiciary has failed to question whether the alleged intrusion on private lands is within the government's valid police powers. Rather, the court has focused, instead, on the circumstances in which the valid use of government power is sufficiently destructive as to warrant compensation. From the perspective of the Constitution's *property constraints*, public administrators need not worry whether a given power is permissible, but rather, what are the public costs associated with any mandated compensation.

CONCLUSION

In assembling the American constitution, the Founding Fathers were forced to confront the tensions between private freedoms and the efficient administration of public resources. By fragmenting the chain of command and limiting the scope of governmental authority, they consciously elected to bias the system in favor of personal liberties.

The *organizational constraints* nested within the "separation of powers" have, to date, thwarted a dangerous consolidation of power. But these organizational safeguards serve to complicate the efficient execution of public policy by forcing administrators to accommodate conflicting political demands.

The Constitution's *jurisdictional constraints* further obscure the administration of public policy by forcing administrators to mind the complicated legal boundaries established between state and federal governments. Even with clear administrative directives, government officials are occasionally reined in by the judiciary for overstepping their constitutional responsibilities.

As if the execution of public policy were not sufficiently complicated, officials must be mindful of the *property constraints*, which compel government entities to provide compensation for the regulation of some privately held resources.

In each of the three examples, administrative efficiency is sacrificed to ensure the preservation of basic personal liberties. However problematic or politically inexpedient, their basis in constitutional law renders many notions of practical reform virtually impossible.

Constructive Change Proposals, Assessing the Validity of

Elisabeth Wright

*School of Business and Public Management, George Washington University,
Washington, District of Columbia, U.S.A.*

INTRODUCTION

The theory of changes is unique to public contracting. While the parties to a commercial contract may negotiate the right to make subsequent changes to the contract in public sector contracting, the public entity generally retains the right, through the contractual language of a changes' clause, to make unilateral changes within some predetermined parameters. This right seeks to preserve the government's fiduciary duty in the expenditure of public funds.

However, changes outside of the contractual right to make changes can occur. Such changes are commonly known as constructive changes, i.e., the changes outside of the authority of a changes' clause. This article examines the nature of the constructive change and offers an approach for examining the validity of claims based on the constructive change argument.

THEORY OF CHANGES

Contracts between commercial and public entities generally contain a clause that permits the public party (i.e., the buyer) to the contract to make changes in specific areas related to or arising from the contract. Such a right protects the expenditure of public funds; that is, work or other contractual matters can be redirected or redefined to ensure that what is actually necessary is accomplished. The ultimate objective is simple and important: wise expenditure of tax dollars in pursuit of satisfying a government need.^[1]

The changes' authority is specific and is limited to certain predefined actions that can be taken only by those who have actual delegated authority to make or direct changes. The authority and scope of changes is limited by design. Decentralized or informal authority to make changes to any contract would undoubtedly cause systemic havoc and chaos—from a contract performance perspective and from a financial management perspective.

Contract performance is framed by the boundaries of the written contract. The supplier is required to furnish the items required by the contract according to the terms and conditions of the written contract. Thus a fundamental requirement of changes is the ability to

identify work performed, but not required by the contract. Changes that have been properly ordered according to the terms and conditions of the contract (i.e., a changes' clause) are considered to be formal changes and are recognized as within the changes' authority of the contract.^[2] This clause gives the government the right to unilaterally change the contract after it has been awarded. The specific language of the changes' clause limits the extent and scope of changes. In consideration of this extraordinary right, the government agrees that it will compensate the supplier for the additional costs of the work as changed, will extend performance or delivery dates, if appropriate, or will compensate with money and time.

The contract requires the government to issue changes in a formal written manner. However, circumstances may arise in which the supplier is directed to perform outside of the formal written contract. For example, a government inspector may impose more stringent acceptance criteria on supplies tendered under the contract. In effect, the inspector will change the acceptance criteria of the written contract; this may cause the supplier to incur additional costs or to experience a schedule delay. When this manner of effecting a contract change occurs, the government can be liable for the costs the supplier incurs in complying with the change. In addition to a cost impact, a schedule impact can occur as the result of a contract change. Changes that take place outside of the explicit authority of the changes' clause are considered as "constructive changes." The supplier attempts a legitimate argument that a constructive change occurred and that compensation is appropriate. That compensation can be in the form of additional money, time, or both. Such compensation is referred to as equitable adjustment.

CONSTRUCTIVE CHANGE

The constructive change can be thought of as an "informal" change to the contract. A formal change is written direction from a government official with the specific authority to direct a change. The formal change is followed by the issuance of a "Change Order," generally in the form of a modification to

the contract. The informal change lacks the formality of the written change; that is, it is a verbal or written act by a government employee that causes a change to the existing contract.

The constructive change can arise from any number of actions or inactions on the part of the government. If the government inspector failed to appear at the agreed upon time and date to accept the supplies, then a constructive change argument might be appropriate. Of course, it is necessary in any change situation that entitlement and quantum be proven. That is to say, mere failure to appear on time to accept supplies does not entitle the supplier to additional compensation. If the supplies were not ready for inspection and the inspector failed to appear, then a constructive change argument would not prevail.

Some examples of circumstances that have been held by boards and courts to constitute constructive changes are the following:

1. Impossibility of performance. Time, money, or impracticality makes it impossible to perform. Drawings or specifications tendered by the government that are impossible to meet would pass the test of practical impossibility. (Recognize that with unlimited time and money, many things are possible, but not practically possible.)
2. Defective specifications. Ambiguous or defective specifications that prevent the work from being accomplished. The supplier may have spent time and money after contract award attempting to comply with the specification as provided by the government.
3. Over-inspection and delays. Actions or inactions by government representatives that may place overly stringent inspection and testing requirements on the supplier after contract award. The supplier may have experienced delay and disruption when supplies rejected should have met the contractual inspection and testing requirements.
4. Additional tasking or direction. Actions that cause the supplier to perform work in excess of the level of work anticipated by the contract.
5. Failure to provide timely and/or suitable government-furnished equipment, property, or information. When the contract calls for items and/or information to be provided by the government, timely availability of those items may be critical to preserving contract price and schedule. Additionally, property or equipment provided as "suitable for its intended use" is warranted for its purpose. Unsuitable equipment that cannot be used by the supplier may constitute a constructive change.

There are many other circumstances that can occur during performance of the contract that provide grounds for claims of constructive change. Government contracting officers must ensure that all government personnel involved in postaward activities comply with stated terms and conditions and are fully aware of the scope of their authority and the potential consequences of their actions.

As a consequence of a constructive change, suppliers prepare and submit a proposal for compensation based on the changed work. The quality of the change proposal is of utmost importance because the government must evaluate the validity of the claim. The claim and its supporting documentation must undergo careful scrutiny and analysis. To that end, evaluators must look for specificity in all information provided. A claim that fails to support entitlement should be returned to the supplier. If entitlement is justified, then quantum may be subject to negotiation.

CONTENTS OF THE CONSTRUCTIVE CHANGE PROPOSAL

At a minimum, the supplier's change proposal should consist of the following elements:

1. Statement of the alleged change. This statement should clearly and precisely outline the basis of the claim and the equitable adjustment requested.
2. Statement of the relevant contract requirement. The contract requirements must be clearly established. The supplier's interpretation of the relevant contract requirement may be included. Attention must be paid to this interpretation because it may be unreasonable or inconsistent with the contract language. For example, the use of the word "shall" in the work statement connotes a requirement while "may" suggests a permissive state. Information given in this section of the claim is a critical component of the claim and forms the foundation for continued review and consideration. It defines what the supplier exactly perceived to be his responsibilities under the contract at the time it was signed.
3. Statement of the government action or inaction that caused the performance of work outside the boundaries of the contract. This statement provides detailed information regarding the government's action or inaction that caused the change. It must support the argument that a gap exists between the contract language and the government's action or inaction. In the absence of a well-written document pointing

- to government “interference,” this statement becomes difficult to prove. For example, a letter rejecting all supplies tendered for failure to meet a tolerance of 1 in. compared to the contract requirement of a 1.5-in. tolerance makes entitlement easier to prove. Evaluators are reminded that government action needs only contribute substantially toward the changed work for a supplier to successfully argue a constructive change.
4. Detailed discussion of the additional work performed. This portion of the claim must include a detailed discussion of the excess work performed. For example, specific information regarding increased scope of duties, increased performance levels, higher personnel standards, etc., must be provided. It is not sufficient for the supplier to make a broad-sweeping statement that “delay occurred as a result of government action.” The link between cause and effect must be clearly established. For example, if an item required rework because of overly stringent testing requirements, then the claim should include amount of rework (hours, dates, etc.) and the detailed bill of material substantiating additional material costs.
 5. Detailed cost proposal supporting the additional work performed. The claim must also include a detailed cost proposal showing the actual costs of the changed work. While some suppliers may attempt to use the total cost method approach toward justifying quantum, evaluators are cautioned that using such a method does not provide a causal link for purposes of additional costs incurred. To avoid such a circumstance, contracts should include a change order accounting clause that requires suppliers to have an accounting system in place that segregates costs of changed work. The cost proposal should contain the direct and indirect costs strictly associated with the constructive change. Sometimes, constructive change determinations are retroactive making the total cost approach the logical choice. However, total cost approach suggests that the difference between the contract price and the new cost of the work (plus profit) represents the total new value of the work. Oftentimes, this is not the case. Inefficiencies and other matters unrelated to the change may find a way into the cost proposal when the total cost approach is used. Detailed cost data should be included as a supplement to the claim and should include all pertinent cost back-up information. Detailed records, such as timesheets, supplier’s invoices, and payroll records, should augment the cost proposal.

6. Compensation requested. The supplier should state the specific compensation requested, i.e., time, money, or both. Remember that the existence of a constructive change does not automatically confer rights of compensation. The supplier must demonstrate a direct link between the alleged cause of the change, the change, and the additional costs incurred.

In addition, the well-documented claim should include supporting information that augments or “backs up” the alleged claim. Information, such as records of conversations, technical write-ups, copies of relevant portions of the contract, data analysis, and basis of cost estimates, are useful in analysis of the claim. Photographs can also lend credibility to the claim. In reviewing the content of the request for equitable adjustment, the evaluator should be cognizant of information that is noticeably absent or of conflicting information either among the documents submitted or among documents not submitted. For example, the supplier’s initial technical proposal may address some aspects of the work in a manner that challenges the constructive change argument.

Evaluators must also be alert to the submission of superfluous information that has no relevance to the constructive change itself. Well-organized, clear, and unambiguous information should provide support to the claim. If necessary, additional information should be requested.

IDENTIFICATION AND INVESTIGATION OF THE ALLEGED CHANGE

As part of the review process, the government must conduct an independent review and analysis. This will include a thorough review of all contractual records not only those contained in the official contract file but any that might exist in other government files. Interviews and meetings with government personnel involved or alleged to be involved provide a valuable opportunity to understand the facts and circumstances surrounding the alleged change.

A detailed technical review of the alleged change must be conducted if technical matters are relevant. Experts in the field are best suited to conduct a review and analysis of the supplier’s technical arguments and presentation of the alleged facts. An independent comparison of the supplier’s information and the government’s information must be made to identify any areas that are not in agreement. Such a comparison may form the basis for the denial of the claim or for negotiation of the claim. The evaluation must focus on the extent to which a cost and/or schedule overrun resulted from the government’s action or inaction.

The government team must establish the baseline contract requirements. Reviewing the contract and any extrinsic evidence, such as precontractual correspondence and records, may point to discussions or clarifications with the supplier. Additionally, the supplier's proposal can provide important information about the supplier's intent and understanding when entering into the contract. Review of the supplier's proposal is a critical part of the investigation that cannot be overlooked. In many contracts, the supplier's proposal is incorporated into the contract by reference. This most often occurs when the government elects to pay a premium for a better technical solution. In such cases, the supplier's proposal forms the baseline for technical expectations.

Recreating the history of what happened and who was involved is important. This can be a difficult task because of personnel change and records transfer. File documentation may not adequately represent the events surrounding the constructive change making the recollections of government personnel important. In such cases, oral findings must be documented and added to the government record.

This investigation is important for several reasons:

1. It enables the government to assess the validity of the claim.
2. It allows the government to isolate the extent to which the government may have caused the constructive change.
3. It enables the government to reconstruct the events for purposes of establishing a monetary and/or time value.
4. It prepares the government to support its position in the event of litigation.

RECOVERABLE COSTS

If entitlement has been determined, then every conceivable type of cost analysis should be performed. However, recognize that the extent of resources used during this effort should be commensurate with the value of the claim. Solid cost analysis will place the government in a solid position when negotiating the quantum aspect of the constructive change claim.

It is generally recognized that in a firm fixed-price bid, a supplier does not include contingency costs. A firm fixed-price contract type indicates a well-defined work statement for which no contingency costs are necessary. Additionally, firm fixed-priced contracts are often awarded to the low-priced bidder. That being

the case, suppliers are not motivated to include "unnecessary costs" into their bid price. If it is possible to reconstruct the bid price using some fundamental assumptions, then analysis of various cost elements and cost-estimating relationships may help develop a good negotiation position. Richard Newman's *Supplier Price Analysis* contains useful information that may assist evaluators in developing solid assumptions about a supplier. Typical examples of recoverable costs include increased labor costs caused by productive time problems, additional man hours, wage increases due to extended performance periods, overtime costs; increased material costs, increased overhead costs and repair and alteration costs. The causal relationship must be established prior to any establishment of reasonableness.

Suppliers are not expected to add costs for anticipated changes to their bid price. The costs caused by such changes, if they occur, are expected to be paid by supplemental agreement to the contract. Although a supplier may identify and quantify all costs incurred that are associated with the change and a reasonable profit, such costs may not be an accurate representation of due compensation. In fact, federal procurement regulations caution that costs incurred are not presumed to be reasonable. For example, inefficiency on the part of the supplier may have contributed to the additional costs. Constructive changes does not provide a supplier the opportunity to recover acquired losses that are not related to the change.

CONCLUSION

Constructive changes present unique challenges for government contract managers. Great care must be taken to avoid situations that can result in constructive changes. However, if such a claim is made, then a thorough identification and investigation of the circumstances and facts surrounding the allegation will ensure that the government's findings and conclusions result in a justifiable position that leaves the parties whole.

Contracting for Social Services

Nancy McCarthy Snyder

*Hugo Wall School of Urban and Public Affairs, Wichita State University,
Wichita, Kansas, U.S.A.*

INTRODUCTION

This article addresses the issues associated with growth in government contracting for human services. Interest in the contracting relationship between governments and non-profit organizations has increased since the 1980s. Political pressure to reduce the size of government has led states and municipalities to become more dependent on non-profits to deliver public human services. This trend has been reinforced by deinstitutionalization of disadvantaged populations. Non-profit organizations have stepped forward to design and deliver community-based services for the elderly, the mentally ill, abused and neglected children, and the developmentally and physically disabled. As a result, non-profits have become increasingly dependent on government.

Growth in the non-profit sector and heavy reliance on tax-supported revenue have led to increased scrutiny and concerns about the management capacity of non-profit agencies, particularly in human services where executive directors are typically promoted from line positions and lack training in finance and management. Therefore, the trend toward contracting raises important challenges for governments. Public officials have less control over contracted services than they do over directly produced services. This article further discusses the need for government capacity to monitor the contracting relationship and to ensure accountability for public resources.

HISTORICAL CONTEXT

The primary challenge of public finance is always resource allocation, including how the level and content of government services fits in the overall mix of public, business, and non-profit sector production. The history of social welfare in the United States is a case study in federalism, as well as in the division of responsibilities between the public and private sectors. Relationships between governments and non-profit social service agencies have a long tradition in the United States. At the turn of the twentieth century, it was common for local governments to fund orphanages, hospitals, and relief organizations that were operated by private organizations.

The Social Security Act of 1935 brought the federal government into the social welfare policy arena. However, the federal role was limited, with the exception of retirement insurance, to small grants to states for a few welfare programs. During the 1960s and 1970s, the federal role expanded greatly with the creation of new programs (e.g., foodstamps, Medicaid, Medicare) and large increases in existing programs (e.g., Aid to Families with Dependent Children, child care, and social services). The 1980s was marked by retrenchment in many areas of social welfare. By fiscal year 1997, social service agencies received 20% less from the federal government (as a percent of gross domestic product) than they had in 1980.^[1] In addition to reducing relative spending, the federal government devolved operating responsibility for many programs to state and local governments. At the same time, major changes in policy toward services for the elderly, the mentally ill, and physically and developmentally disabled individuals resulted in the creation of community-based programs to replace institutional care. Thus, at the turn of the twenty-first century, state and local governments had considerably more responsibility for human services and turned increasingly to non-profit organizations to deliver services.

Two major factors have increased attention to the contracting relationship between governments and non-profits organizations. First is a general growing interest in the U.S. non-profit sector. The overall size of the sector increased dramatically during the second half of the twentieth century, from 50,000 to approximately 1.5 million organizations, over one-third of which are “charitable” (i.e., eligible to receive tax-deductible contributions; other categories of non-profit agencies are religious congregations, foundations, and mutual benefit organizations, such as labor unions and professional associations). Today, the non-profit sector, broadly defined, receives revenue equal to almost 9% of gross domestic product and employs roughly 11 million people or 7% paid employment.^[2] This success has led to increased scrutiny and concerns about the management capacity of non-profit agencies,^[3,4] particularly in human services where executive directors are typically promoted from line positions and lack training in finance and management. Attention to non-profit operations has also grown because human service non-profits have become increasingly

dependent on government. By 1980, over one-half of the revenue of these agencies came from the public sector.^[5]

The second trend that has stimulated interest in contracting is political pressure to reduce the size of government. For the most part, Americans have always been suspicious of the public sector, but the period from 1935 through 1980 was marked by significant expansion in all levels of government. Although the trend toward contracting with non-profit agencies for human services predates the strong privatization ideology of the last two decades, the movement has been accelerated by the desire to limit the size and scope of government that has been evident since 1980.

THE CONTRACTING DECISION

The contracting decision involves two major questions: what services should government produce itself, and what should it contract out? Second, when it does contract services, what mechanisms should be employed to ensure effective service delivery?

Governments contract with non-profit and for-profit agencies for services for various reasons—most often to save money, to limit the size of the public labor force, or to use specialized expertise (e.g., legal, architectural, or construction services), for which there is insufficient need for in-house production. In the case of human services, there are additional motives. Among them are to offer consumers greater choice in service providers, to minimize bureaucratic red tape that restricts or slows innovative policy, a belief that non-profit values are more suitable to human service delivery, and a desire to avoid political blame for the failures that inevitably occur. In some jurisdictions, contracting is simply a matter of history or habit. Relationships between governments and non-profit agencies are well established and are maintained with little thought given to their costs or advantages.

Most recently, the increase in contracting has been reinforced by ideological beliefs that markets and competition work better than governments. The traditional accountability tools employed in contracting with for-profit firms are unlikely, however, to be successful with human service non-profits. Contracting works best when market forces are present (i.e., a demand and a supply made up of many buyers and many sellers who compete with each other). To capture competitive efficiencies, the market should be more or less perfect: balanced and complete information, no externalities, increasing costs, homogeneous products, rival consumption, etc. The more imperfect the market, the lower the potential benefits to taxpayers.

The market for human services is characterized by imperfections on both the demand and supply sides.^[6] There is often a single buyer (a monopsonist), either

the state or local government, purchasing specialized services from relatively few suppliers. The problem of limited supply is particularly acute outside large urban areas. The presence of market imperfections means that government has limited alternatives, increasing its interdependence with private providers, exacerbating the problem of acquiring accurate information to make contracting decisions and raising the potential for conflicts of interest. The result is similar to a bilateral monopoly, the very antithesis of competitive efficiency. As Don Kettl pointed out: “a too enthusiastic embrace of the competitive prescription might produce the wrong medicine for a misdiagnosed disease.”^[6] Nevertheless, the trend toward expanded contracting is unlikely to be reversed in the foreseeable future. As a result, governments need effective tools to manage the contracting process.

ACCOUNTABILITY

When governments produce services directly, accountability to the public is assured through the electoral process and the presence of hierarchical bureaucracies that make line workers answerable to supervisors who are ultimately answerable to elected officials. When governments contract for services with for-profit firms, market competition enforces accountability for cost and service quality. Non-profit organizations lack both political and market feedback systems to ensure accountability.

Early financing relationships between government and non-profits involved grants with few strings attached. As government has come under increased scrutiny and demands for accountability, public officials have passed those demands on to non-profits. Increased contracting for human services creates challenges for both governments and non-profits to develop additional methods of assuring the public that its resources are being efficiently and effectively used. Contracts essentially substitute for markets and typically incorporate two different accountability models:^[3] standards/compliance and outcomes/performance.

Standards/Compliance

The standards/compliance approach is the most commonly used method of ensuring accountability. It compares agency operations with a set of established standards. It asks questions such as: How many clients were served? Were clients accurately screened to determine eligibility for services? What services and how much of each service did they receive? Are client records complete and current? Are procedures in place to protect client confidentiality? Do employees possess the appropriate professional licenses? Are clients made aware of

the agency's process for appealing a service decision? Does the agency have a governing board of at least seven members that meets at least four times per year? Are copies of last year's audit and IRS Form 990 on file?

The standards/compliance model is used extensively because it is the cheapest and most easily managed accountability tool. Standards are relatively easy to write into contracts and auditors can easily monitor and document compliance. The major disadvantage of this model is that it does not guarantee effective services. It is possible to meet all standards and not achieve program goals.

Outcomes/Performance

In recent years, funders of human services have placed greater emphasis on identifying program outcomes and measuring performance toward achievement of those outcomes. This outcomes/performance model of accountability addresses many of the weaknesses of standards/compliance techniques. It keeps agencies focused on desired outcomes, rather than on mere service levels. It starts with the underlying question of "what is this program trying to achieve?" It then asks questions such as: Is the client improving? Has the client gained knowledge or changed their behavior? Is the client avoiding negative outcomes (e.g., hospitalization, incarceration, truancy)? Is the client satisfied with the services received?

Outcomes/performance accountability has been difficult to implement. Non-profit agencies argue that much of the work in human services is inherently unmeasurable.^[7] The outcomes/performance model is also hampered by the fact that consistently effective treatments do not exist for some conditions. So even when measurable outcomes are known, dependable interventions may not be available to achieve desired outcomes. Contracting agencies are naturally resistant to being held accountable for outcomes that are not consistently achievable or when factors outside the contractors' control (e.g., judicial decisions) affect outcomes.

Because human service goals are hard to define, results hard to measure, and treatments uncertain, it becomes difficult to write meaningful quality specifications into requests for proposals (RFPs) and contracts. This creates a tendency to substitute client satisfaction or professional standards for quality. Although satisfaction is a legitimate concern, what happens if the client is satisfied, but does not appear to be improving?

Professional standards have their own set of problems, the greatest of which is cost. Although most national accrediting bodies would argue that they enforce minimal standards, they tend to have biased views of what is minimal or acceptable. Substituting professional standards for quality measures (e.g.,

client-staff ratios) can have the effect of forcing government to purchase a higher level of service than the public generally demands. Decision makers need to be able to distinguish a "Cadillac" from a "Chevy" in terms of service quality and allocate resources with knowledge of those distinctions. However, despite these weaknesses, outcomes/performance approaches show considerable promise for improving the effectiveness of human service programs.

Capacity Building

It has been convincingly argued^[4] that overemphasis on outcomes can create problems for non-profits and ultimately for society. As funders (United Ways and foundations, as well as governments) have become more outcomes conscious, they have moved more and more toward program funding (as opposed to general grant funding). The result is that it is increasingly difficult for non-profits to use "profitable" programs to subsidize unprofitable ones or to fund administrative overhead.^[7] Outcomes are more expensive for agencies to document and for funders to monitor. Social service agencies are generally resource poor relative to other non-profits. In 1996, human service organizations comprised 40% of active charities (those that file IRS Form 990), but expended only 13% of the resources.^[8] Many lack up-to-date computer technology, appropriate accounting systems, and generally accepted management practices.

Analysts of non-profit reform^[3,4] have begun to argue that far too little attention has been given to the potential of capacity-building in the non-profit sector as a way to ensure accountability. They claim that effective non-profit organizations are more important than effective programs in providing lasting social impacts. Programs do not stand alone and are a weak base for large scale social reform because client needs and the operating environment are always changing. A capacity-building model of accountability asks questions such as: Does the agency have the ability to identify changing community needs? Can the agency adapt to shifting needs and operating environments? Does the agency possess the information systems to accurately track finances and client outcomes? Does agency staff possess the managerial, financial, and technical skills to design, fund, and implement innovative programs?

The advantage of capacity building is that it institutionalizes responsiveness, learning, and innovation, and ultimately reduces the need for detailed contract monitoring. It is, however, a more expensive and long-term accountability method than either standards/compliance or outcomes/performance, requiring efforts and resources that may be beyond those of a single government.

GOVERNMENT CAPACITY

Contracting imposes significant transaction costs on both governments and non-profits. The latter must adapt to short lead times, voluminous reporting requirements in formats that vary among funders, uncertain political climates, limited discretion, divergence from declared mission to respond to government service priorities, fragmented planning and program structures, and cost shifting resulting from demands that they supplement contracts with their own resources.^[9] Both governments and non-profits need good information systems, the full cost of which is rarely covered in contracts.

Governments incur other transactions costs that are typically not calculated in the cost of contracting. It has become a truism that “contracts do not manage themselves.” It takes time and resources to effectively monitor the performance of non-profit service providers. Particularly when employing outcomes/performance accountability, government agencies need staffs who can write detailed and specific RFP and contract specifications, identify effective rewards and penalties, and who know how to advertise and solicit bids, review proposals, resolve technical disputes, analyze costs, negotiate final^[6] agreements, and monitor for service quality and costs. They need a strong mix of program expertise and contract management skills, as well as communication skills and sound judgment. Staff members with long histories of monitoring standards/compliance-type contracts often find it difficult to loosen the control necessary for successful outcomes/performance contracting.

Effective contract enforcement requires independent audits of reported outcomes. In addition to hiring individuals with the requisite skills, governments need to have sufficient internal resources to effectively manage the existing contract caseload in both program and legal departments. From a broader policy perspective, contracting makes it more difficult for government managers to develop a clear jurisdictionwide picture of services and beneficiaries, hindering effective policy planning.

The challenge for governments is to assist in capacity building in the non-profit sector, as well as to instill best practice in non-profit management and operations, while resisting the temptation to dictate, dismiss, duplicate, or micromanage the contracting agencies. In an era of privatization, government performance depends on contractor performance. “[G]overnment is no longer a buyer dealing at arm’s length with a seller, but a partner in a virtually seamless, mutually dependent interrelationship.”^[6]

The most effective partnerships incorporate joint planning in identification of need, service design, and specification of performance measures. Non-profits are more likely to embrace outcomes/performance

accountability if they participate in selection of the measures and targets. Partnerships are characterized by mutual respect for the values and demands of both parties. Public managers need to develop a deeper appreciation of the strengths of the non-profit sector^[10] while they work to teach non-profit managers to speak the language of performance, outcomes, and accountability. Successful contracts depend more on the personal relationships between contract monitor and program director than on legal specifications. Communication and trust can overcome many technical hurdles.

POLICY ISSUES

Contracts add organizational layers between taxpayers who finance human services and the non-profit workers who deliver the services. This inevitably increases administrative costs and hinders effective communication. It also complicates questions of accountability for public resources, and of who gets political credit for successes and blame for failures.

The recent push toward privatization is based less on clear evidence of its benefits than on ideology. Historically, human service non-profits have developed informal networks of like-minded agencies to serve disadvantaged populations. The advent of winner-take-all contracting and the forcing of competitive “business-like” practices on individuals and organizations that are naturally non-competitive appears to be breaking down the cooperative infrastructures that makes non-profits so appealing as service delivery agents (i.e., values of compassion and service, responsiveness and flexibility, disregard for profit motives, willingness to assume contracts at less than full cost of production, acceptance of below-market wages, openness to sharing information).

Public sector human service systems (e.g., public welfare, mental health, developmental and physical disability services, senior services) were created in the mid-twentieth century because the private social welfare system was unable to meet public demand for serving the most difficult client populations. State and local governments are now asking non-profit organizations to assume a larger portion of service delivery to the most needy clients. This raises questions about the sustainability of non-profits’ willingness or ability to assume public duties. It also begs the question of what is public and what is private.

CONCLUSION

Overall, contracting for human services is a public policy tool that can serve useful purposes. It is not a substitute for answering the underlying policy questions. What services should be contracted and with

whom? What benefits are achieved if a government service delivery monopoly is replaced with a non-profit monopoly? Are efforts to improve accountability forcing uniformity that undermines the diversity and flexibility of non-profit service delivery? With what justification do governments treat non-profit contractors different from for-profit contractors? When resources are inadequate to serve all those who are eligible, what allocation decision should be made (e.g., restricted eligibility, waiting lists)? Who should make those decisions? How thin can resources be spread before they become ineffective for clients? Is the public willing to accept the reality that there are some clients who are unlikely to improve no matter how many services are provided, or that in the best human service delivery systems, there will be occasional failure? Finally, who is ultimately responsible for caring for the hardest to serve, most vulnerable and needy populations?

Control Systems

Lynda M. Dennis

Public Administration Department, University of Central Florida, Orlando, Florida, U.S.A.

INTRODUCTION

Control systems in governmental organizations vary greatly based on the type of organization as well as its size and service capacity. These systems help assure accountability with respect to the receipt and expenditure of public funds.^[1,2] Effective control systems require cooperation between and among officials, management, and staff at all levels of the organization.^[3] At the end of the day, elected officials are ultimately and directly accountable to citizens and stakeholders (external accountability). Management and staff of the governmental organization, however, are accountable and responsible for their actions day after day (internal accountability).^[4] Therefore, public policy efficacy is determined in large part by the quality of financial management information and its underlying control systems.^[5]

Safeguarding the assets of the governmental organization has been the traditional goal of most control systems and this was achieved through any number of methods, policies, and procedures. As such, these control systems focused on producing accurate and reliable financial information and encouraged adherence to the established policies and procedures.^[6] A secondary focus of the traditional control systems was to promote operational efficiency primarily by establishing methods, policies, and procedures^[6] based on their cost–benefit to the organization.^[2]

There are a number of characteristics unique to governmental organizations that influence the design, implementation, execution, and review of their respective control systems. Governmental organizations are established by, and operate under, a myriad of laws, regulations, statutes, and rules; and, as such they are subject to far more legal constraints than nongovernmental organizations. The political aspect of governmental organizations may result in elected officials that are not familiar with governmental activities, the impact of regulations, and the totality of external accountability.^[2] This coupled with finite terms of office and/or term limits may cause them to make short-sighted decisions and/or focus more on visible results rather than the strength of the underlying control systems.^[7] Senior management staff appointed by elected officials, acting alone or as a governing body, may find themselves subject to the same political

influences as the elected officials.^[2,7] The public aspect of governmental organizations often results in elected officials and management being held responsible by the press and constituents for insignificant matters. This same “publicness” also requires elected officials and senior management to respond to the results of audits and other regulatory reviews.^[2] The education and experience of an organization’s leadership, management, and staff influence whether control systems have a control, management, or planning orientation. In a control oriented organization control systems focus on completion of specific tasks and strict observance of policies and procedures. Efficiency and effectiveness in daily operations are hallmarks of a management orientation while a planning orientation focuses on organizational goals and how to achieve them.^[8] In small and medium governmental organizations, there may be a limited number of administrative personnel and/or a limited number of qualified personnel in administrative positions. The lack of qualified personnel in these governmental organizations may affect the orientation, scope, and effectiveness of its control systems.

Overview

This chapter discusses control systems in governmental organizations in the context of accountability from both a traditional and innovative perspective. Stakeholders insist that their governments provide services economically, efficiently, and effectively.^[1] They want to know that programs are not only operating as designed and achieving the desired results but that this is accomplished at a reasonable cost.^[3] As such, managers and elected officials are accountable to all stakeholders for the activities of their organizations and the related results.^[1] In this chapter, control systems, as a measure of accountability for public resources, are presumed vital to the governance process and an essential element for a healthy democracy.^[1]

CONTROL SYSTEMS AND ACCOUNTABILITY

Financial or performance audits performed by independent auditors external to the governmental

organization are considered the most objective measure of accountability for governmental organizations.^[8] External auditors performing audits of governmental organizations are usually certified public accountants (CPAs) that conduct their audits in accordance with professional auditing standards referred to as generally accepted auditing standards (GAAS). Auditing standards related to financial statement audits of nonpublicly traded companies are promulgated by the Auditing Standards Board of the American Institute of Certified Public Accountants (AICPA). All CPAs conducting audits of nonpublicly traded entities must abide by these auditing standards.^[2]

Auditors conducting financial or performance audits of governmental organizations may be required to also adhere to government auditing standards (GAGAS) which are promulgated by the Comptroller General of the United States and the Government Accountability Office (GAO). These additional government auditing standards apply to financial and performance audits of governmental organizations receiving government assistance (i.e., federal grants) at or above certain statutory amounts (currently \$500,000 in the aggregate).^[1] A number of states require that audits of local governments located in their states be performed in accordance with GAGAS (in addition to GAAS). Additionally, some state auditors promulgate standards, rules, or regulations that auditors must adhere to in financial or performance audits of governmental organizations. These requirements typically apply regardless of the level of federal government assistance received and/or if state financial assistance is received.^[1,2]

Auditing standards related to governmental organizations (GAAS and GAGAS) require the audit be planned to provide “reasonable assurance” the financial statements are free of material mis-statements due to illegal acts having a direct and material effect on financial statement amounts. Illegal acts include violations of laws, rules, regulations, or contract/grant provisions.^[1,2] In audits of governmental organizations where GAGAS are required, illegal acts also include instances of “abuse” (which is different from violations of laws, rules, etc.) if such instances could significantly affect financial statement amounts or program performance results. Abuse occurs when a program/entity falls short of reasonable and necessary businesses practices expected by a prudent person.^[1] The standard of “reasonable assurance” is also extended to material misstatements due to errors or fraud.^[2]

Inherent in both GAAS and GAGAS is the requirement for the auditor to review the governmental organization’s system of internal control.^[1,2] Because of this auditing standard, financial managers in a governmental organization may tend to be control oriented in their approach to the organization’s control system.

Unfortunately, managers in other functions within the organization may believe such controls to be onerous.

The auditing standard related to reviewing the system of internal control requires that the auditor obtain and evaluate evidential matter concerning the amounts reported by management in the financial statements and/or supporting books and records. To do this, the external independent auditor will examine such supporting documentation as vendor invoices, bank statements, billings to customers, etc. The purpose of this review is to determine the legitimacy of the transaction, accuracy of transaction amounts and coding, whether any unrecorded transactions exist, and/or the existence of any related rights and/or obligations. In addition to the detailed review of the internal control system, the external independent auditor will also review the control environment of the governmental organization.^[2] This may include ascertaining the following:

1. Management’s reputation in the community;
2. Management’s attitude, awareness, and actions concerning the control environment;
3. Effectiveness of overall financial controls related to operating within approved budgets and management’s ability to produce timely and accurate financial reports; and
4. Degree of centralization/decentralization in the accounting systems and whether or not it is warranted in the circumstances.^[2]

A financial or performance audit conducted by an independent auditor external to the governmental organization is a key component of providing accountability to stakeholders. In the case of audits performed under GAGAS, the auditor also reports on the governmental organization’s system of internal control noting any significant deficiencies in it found during the audit.^[1] The financial or performance audit allows stakeholders and other parties to have confidence that the reported financial and/or program operating information is reliable.

MANAGEMENT’S RESPONSIBILITY FOR CONTROL SYSTEMS

In a governmental organization, management as represented by elected officials and senior staff is responsible for its control systems. As such, management is concerned with the efficient, economic, and effective application of resources in order to legally achieve the purposes for which they were established.^[1,9] Management is responsible for ensuring its control systems comply with all applicable laws, regulations, statutes, and rules.^[1,2] Additionally, management is responsible

for providing the public, oversight agencies, and other stakeholders with appropriate reports showing accountability for resources used and program results.^[1,2] To summarize, control systems established and maintained by management should ensure the following:

1. Appropriate goals and objectives are met;
2. Resources are used efficiently, effectively, and economically;
3. Resources are safeguarded;
4. Applicable laws, regulations, statutes, and rules are followed; and,
5. Data produced is reliable and fairly disclosed.^[1,2]

Statement on Auditing Standards No. 99, *Consideration of Fraud in a Financial Statement Audit* (SAS No. 99), was issued by the AICPA in October of 2002. As defined in this statement, fraud is an intentional act that results in material misstatements in the financial statements that arises from fraudulent financial reporting and/or misappropriated assets. Generally, fraud occurs when three conditions are present: 1) incentive/pressure; 2) opportunity; and 3) rationalization/attitude.^[10] It is the responsibility of management to design, implement, and maintain control systems to deter, prevent, and detect fraud.^[9,10]

Public demands on elected officials and staff to provide more services with fewer resources may place undue pressure on staff and create situations conducive to fraud. Pressure put on staff by elected officials to report positive financial results may also create situations that encourage fraudulent financial reporting.^[9] Situations that auditors might look at as creating opportunities for fraud include the following:

1. No formal budgeting or planning process;
2. Budget not prepared by appropriate level of management or prepared without input from employees understanding the budgetary aspects of the organization's activities;
3. Uncontrolled, or ineffectively controlled, access to cash or cash equivalents;
4. Appropriate documentation for time worked, overtime, etc. is not required and/or properly documented; and,
5. Department/agency directors have authority to spend outside of budgetary process.^[2]

With respect to rationalization/attitude, auditors may be concerned if the governing body/management does not support public accountability or programmatic efficiencies. Likewise, a governing body/management displaying significant disregard for regulatory, legal, and/or oversight requirements of regulatory agencies would be of concern to the external

independent auditor.^[2] Under SAS No. 99, external independent auditors are required to consider opportunities management may have to override existing control systems as a fraud risk factor.^[10,11]

TRADITIONAL CONTROL SYSTEMS

Historically, the background of many of the chief financial officers of governmental organizations was strongly routed in accounting, auditing, or both. As such, they typically viewed governmental accountability as a function of strict internal controls primarily in the areas of spending, procurement, payroll processing, and hiring practices.^[8] Traditional control systems were principally concerned with the following:

1. Properly qualified personnel in appropriate positions;
2. Proper segregation of duties;
3. Separating operations from accounting (often created through centralization of all or most accounting functions);
4. Assignment of responsibility as appropriate in specific circumstances;
5. Maintaining control over bank accounts, cash receipts, and cash disbursements;
6. Recording transactions accurately and timely; and,
7. Safeguarding assets by limiting access to source records, accounting systems, etc.^[6,8]

Under the traditional concept of control systems, administrators used the budget as the primary financial control mechanism. The budget was utilized to prevent overspending, ensure budgetary balance, and ascertain funds were spent in accordance for approved budget purposes and amounts.^[3] Following the scientific administration theorists, early control systems focused on technical skills and work efforts. During this time, resources were focused on the efficient achievement of goals and objectives albeit using a scientific management orientation.^[12,13]

CONTROL SYSTEMS AS FINANCIAL MANAGEMENT CAPACITY

During the 1980s and 1990s, techniques such as budgeting for outcomes were developed to accommodate the delegation of decision making to lower levels and to increase accountability among public organizations.^[14] In an effort to link resource allocation decisions with performance and outcomes, alternative budgeting techniques and formats such as program, zero-based, target-based, outcome-oriented, and

performance budgeting were adopted by a number of governments.^[15,16] Decentralization of functions and moving from rules to guiding principles occurred in such areas as purchasing, budgeting, and personnel.^[17–19]

In the context of control systems, managing for results entails establishing controls that ensure the sound financial condition of a governmental organization. In other words, effective management is necessary for effective governance. As such, management capacity is not only personal qualities but organizational processes and activities as well. Without effective management, government organizations will never reach their optimum level of overall effectiveness. Management capacity is the crucial link between government resources and public services. Understanding how management capacity relates to results is the first step in improving performance and accountability in government organizations.^[12,20]

Financial management capacity is the fundamental ability of a governmental organization to develop, direct, and control its financial and economic resources. Similar to supply chain management, financial management capacity is having the right resources in the right place at the right time. Drivers of financial management capacity include: 1) characteristics of the financial management system; 2) nature and extent of support from top leadership; and 3) the degree of integration and alignment across other management systems.^[12] As a control system, financial management capacity includes policies and procedures related to procurement, accounting, cash and investment management, debt management, and budgetary execution and control. To be effective, financial management control systems should support managers while allowing them autonomy and holding them responsible for results.^[12,21]

The objective of a government's control system related to financial management capacity is to ensure and maintain sound financial condition without negatively affecting service levels and/or quality. For any government the challenge is identifying those components of an ideal financial management control system that can be effective in their specific circumstances. An effective financial management control system provides information related to how well the governmental organization used its available resources. It also provides quality information on a timely basis that is appropriate for the intended decision maker.^[21]

Applying management capacity theory, financial management control systems that simply measure inputs and outcomes without considering the context of, and capacity for, organizational performance are misleading. Therefore, financial management control systems should treat the traditional functions of analysis and measurement as neutral activities. Conversely, managers should be viewed as decision makers,

strategists, and analysts rather than neutral bureaucrats. This nontraditional focus of financial management control systems on organizational performance necessitates allocating the appropriate level of resources in accordance with strategic concerns. In so doing, public managers will spend the governmental organization's limited resources effectively and accountably.^[12]

Accurate revenue and expenditure forecasting is critical to the effectiveness of this nontraditional model of financial management control systems. Additionally, elected officials and staff must focus on the long term including planning, both financially and operationally, for contingencies. It is also necessary that all involved in this type of nontraditional financial management control system understand the relationship between cost, performance, and resource allocation. As with any control system focused on overall organizational performance, appropriate flexibility must be included in this nontraditional type of financial management control system.^[12]

COMMUNICATION, COORDINATION, AND INTEGRATION FOR FLEXIBILITY AND CONTROL

Various relationship networks exist within and across all levels of today's complex governmental organizations. These internal and external environments significantly impact the classic policy/performance equation (public resources to public management to public policy results) in any governmental organization. Effective implementation of a nontraditional financial management control system requires network-wide cooperation. As such, common objectives should exist that unite the various network components in essential ways and that contribute to the development of integration strategies.^[12]

The number and complexity of financial controls increased in many governmental organizations in response to stakeholder demands for increased accountability.^[3] It may prove difficult to integrate a nontraditional financial management control system in organizations where existing budget allocation and execution systems are mired in control oriented processes and procedures. In such organizations, elected officials and management may need to be reminded of the objectives of public expenditure management. Such objectives include not only fiscal discipline (through expenditure control) but also resource allocation consistent with policy priorities and good operational management.^[4]

Chances for successful integration of financial management control systems can be increased by combining managerial and political needs. This can be done

most effectively by using citizen articulated goals to combine the routine needs of departments with policy goals of elected officials.^[3] There still exists, however, a need to balance this strategic and citizen-driven process with effective financial controls. For example, decentralization typically reduces micromanagement and unnecessary oversight. Therefore, if certain processes are decentralized based on the mutual agreement of the affected networks, there should be an increased level of accountability for performance. Decentralization only works if managers possess the requisite skills related to the decentralized process. If funds are allocated using a strategic focus and based on projected results, managers should be held accountable if the projected results are not achieved.^[3]

Other areas where it may be possible to achieve effective communication, coordination, and integration of nontraditional financial management control systems include the following:

1. Increased budget and contract authority for senior management;
2. Increased spending authority at all levels of the organization as deemed appropriate in specific circumstances;
3. Allowing budget transfers at various administrative levels but within statutory limits;
4. Establishing discretionary spending accounts for use in unforeseen emergencies or in certain other qualifying circumstances; and,
5. Full integration of performance and/or program budget formats including linkage to budget allocations to increase effectiveness.^[3]

CONCLUSIONS

This chapter discussed control systems in governmental organizations in the context of accountability from both a traditional and innovative perspective. It was pointed out that stakeholders want their governments to provide services economically, efficiently, and effectively and that they want to know programs are operating as designed and achieving the desired results. This chapter focused on the idea that managers and elected officials are accountable to all stakeholders for the activities of their organizations and the related results. Key to this chapter was the point that as a measure of accountability, control systems are vital to the governance process and an essential element for a healthy democracy.

In this chapter, it was emphasized that an integrated financial management approach balances control with effectiveness. A number of ways this balance could be accomplished were discussed in this chapter. The chief premise of this chapter was that control systems should

be viewed in the context of management capacity theory. Control systems, as financial management capacity, expand the traditional concept of financial management (i.e., control systems) from a narrow accounting/budget focus to one of strategic issues and program results. As such, governmental effectiveness depends on the quality of financial management information and procedures.^[5]

For some governmental organizations, the quality of financial management information may be improved by a more comprehensive and/or consistent budget process and/or format. Better integration of accounting and budgeting data with operational results can also improve the quality of financial management information for some organizations. For others, financial management information may be improved by simply installing up to date information technology systems. Improvements to increase the quality of financial management information will be in vain unless there is increased accountability for costs and results.^[5]

For purposes of external and internal accountability, control systems are a necessary part of the operations of all governmental organizations. External independent auditors rely on an organization's control systems in assessing the effectiveness of the related controls. Moving from a traditional control oriented system to one focused on financial management capacity is not a short-term effort.^[5] It requires a paradigm shift in thinking at all levels of the organization as well as a high level of trust between citizens, elected officials, and staff.

Cooperative Purchasing

Alex Sekwat

*Institute of Government, Tennessee State University,
Nashville, Tennessee, U.S.A.*

INTRODUCTION

Cooperative purchasing refers to a variety of arrangements in which two or more entities buy goods and services under the same agreement or contract. The National Association of State Purchasing Officials (NASPO) (Ref.^[1], p. 94) defines cooperative purchasing as “buying through public solicitation of competitive bids or competitive proposal by two or more other public jurisdictions, authorities, or agencies.” According to NASPO (Ref.^[1], p. 94), cooperative purchasing “may include the resale or exchange of goods and services without competitive bidding and the shared use of facilities, procurement information, and procurement personnel.” Generally, cooperative purchasing arrangements require that participating entities sign a voluntary agreement or memorandum of understanding specifying, among other things, procedures for participation in contracts, warehousing, fee payments when applicable, contract dispute resolution, terms of agreement, and payment of invoices. Sponsorship of cooperative purchasing programs vary among states. However, all require participating jurisdictions to use best value in the procurement of goods and services.

OVERVIEW

There are many forms of cooperative purchasing agreements. The most common types include the join-bid contract, piggybacking, and joint administrative or consolidated purchasing. The join-bid method is popular among state and local government units. Under this technique, two or more jurisdictions take advantage of the benefits of centralized purchasing by reaching consensus on specifications, contract terms, and conditions for common products. The bidding requirements of the participating jurisdictions are pooled in a single invitation for bids to realize larger volume and better unit pricing. The piggybacking method requires a lead jurisdiction or large purchaser of product(s) to invite bids, enter into a contract, and arrange for other jurisdictions to purchase the same products under the same conditions.^[2] Local jurisdictions often piggyback

purchases on procurement done by state agencies especially of heavy equipment. The joint consolidated or administrative purchasing method is a formal contractual arrangement where several jurisdictions agree to set up an administrative agency responsible for partial or entire purchases for the participating entities. Under this method, each jurisdiction must give up its freedom to comply with terms of the formal contract. The lead agency is in charge of preparation of specifications, solicitation and evaluation of bids, monitoring participation, and administration of the contract. Participants share the administrative costs of the program. Joint purchasing is typically used by public agencies within a specific metropolitan area, agencies within a state, jurisdictions taking advantage of contract prices negotiated by a state, and educational institutions using contract prices negotiated by national educational associations.^[3]

Other variants of cooperative procurement, especially among local jurisdictions, include the joint use of facilities and exchange of technical information and personnel.^[2] Under the former method, two or more entities may agree to jointly use facilities such as a warehouse or a testing laboratory. Such an arrangement is intended to reduce procurement costs. In the event that jurisdictions are not in position to purchase cooperatively, “they at least can help one another by sharing information, loaning their staff, or letting others use their facilities or product specifications” (Ref.^[2], p. 352).

Cooperative purchasing is used by private, public, and non-profit sector entities. In the public sector, federal agencies, state agencies, and the approximately 87,000 local jurisdictions in the United States can engage in cooperative procurement. Non-profit agencies, such as hospitals, colleges, universities, and religious organizations, are also major participants in cooperative purchasing. Although jurisdictions or organizations may have operational differences, they buy basically the same types of goods and services. The most jointly procured goods and services by state and local jurisdictions include vehicles, computer systems, software, office supplies, gasoline, automotive and heavy equipment parts, furniture and office equipment, asphalt, tires, pharmaceuticals, janitorial supplies, training services, travel services, and telephone

services. In general, products or services, which are utilized by a large number of jurisdictions, are awarded by competitive bids.

HISTORICAL BACKGROUND

Cooperative purchasing is not new in the United States. The earliest known established practice in the public sector dates back to about 1930 in Alamosa, CO, when eight school districts formed a purchasing pool. Other early initiatives in cooperative purchasing included the formation of a joint procurement venture between the City of Cincinnati, OH, and the Hamilton County, OH, in 1931 and the purchase of fire hoses by the Michigan Municipal League for eight municipalities in 1938. The Cincinnati–Hamilton County plan was formed on a voluntary basis and managed by a coordinating committee of purchasing agents of Hamilton County composed of the purchasing agents of Hamilton County, the City of Cincinnati, the Cincinnati Board of Education, the Public Library of Cincinnati, and the University of Cincinnati.^[4] By the late 1970s, intergovernmental cooperative purchasing reached its maturity. The publication in 1978 of the Model Procurement Code marked a milestone in the efforts of state and local governments to adopt laws and ordinances that encouraged and facilitated intergovernmental purchasing cooperation. Today, the practice is widespread among states, counties, cities, towns, villages, school districts, special school districts, colleges, universities, agencies, authorities, commissions, and other bodies with the power to award public contracts.

BENEFITS

Cooperative or pool purchasing has several benefits. First, by buying identical or similar goods and services in large volumes, participants save money and time. Volume purchasing provides participants with economies of large-scale purchasing by lowering unit costs of products. Pooling of purchasing functions further lowers administrative costs by substantially reducing duplication of efforts associated with competitive procurement. Second, cooperative purchasing programs save participants time to research specifications, to identify vendors, and to prepare, advertise, and administer a bid proposal or maintain a contract. Third, pool purchasing offers program subscribers standardized specifications, better quality control, and broader selection of goods and services. Finally, cooperative purchasing facilitates information sharing and expertise, especially among smaller jurisdictions that lack resources to hire full-time professional purchasing

managers. Professional management of purchasing functions further benefits smaller jurisdictions in technical procurement functions such as preparation of specifications, training, economic analysis, development of buying strategies, testing and inspection of products, and disposition or exchange of surplus property.^[1]

DRAWBACKS

Despite the benefits highlighted above, cooperative purchasing has some major drawbacks. First, certain legal and political obstacles impede the growth and development of cooperative purchasing programs. The major political obstacles include “preference of local vendors, the fear of loss of autonomy, the difficulty of settling on standardized items to all, and the feeling of the larger participants that their savings will be less than those of the smaller units.”^[3] Experience indicates that over time, political barriers are more difficult to overcome than legal barriers.^[3] Second, sharing of administrative and technical overhead costs, especially under a join-bid arrangement, is problematic. Great effort is needed to assemble the participating jurisdictions, to draft and coordinate terms and specifications, to prepare bidders’ lists and draft solicitations, and to tabulate and evaluate responses.^[4] Last, if poorly designed, a cooperative purchasing program can increase the carrying costs for participating jurisdictions. Volume buying typically increases storage, insurance, coordination, and transportation costs. As noted by Reed and Swain,^[5] “when items are purchased in large amounts, those items will need to be stored since products must be stored for an extended period of time. They must be stored so that they do not deteriorate, which may require special facilities. . . . Clearly, considerable thought needs to be given to the costs of such enterprises.”

CONCLUSION

Cooperative purchasing promotes sound administrative values, including economy and efficiency, by maximizing the time and resources of participating units. It is cost-effective and provides participants with the economies of large-scale purchasing. Thus it renders high value for taxpayers dollars. Well-rounded cooperative purchasing programs further foster intergovernmental cooperation and reduce duplication of work. However, as noted by NASPO (Ref.^[1], p. 96), “successful programs need favorable laws, adequate implementing regulations, energetic leadership, and cooperation among the parties.”

INTRODUCTION

The American correctional system consists of four major components including jails, prisons, probation, and parole. These components are interdependent, working together to protect society and carry out the criminal sentence. Because corrections is a matter of public policy, its goals and activities are often dependent on which political ideology is dominant at the time.^[1] As such, correctional policy has vacillated between the liberal agenda of rehabilitation and the more conservative approaches of deterrence and incapacitation. For the past 25 years, the latter has won out with “get-tough” policies that have contributed to unmanageable growth in the correctional population. Most of a correctional administrator’s time is devoted to managing this growth and to developing practices that promote the objective and efficient allocation of resources. This article will first review the evolution of correctional policy and discuss the consequences of getting tough on crime. It will then describe four correctional trends that have emerged to manage the ever changing and growing population of offenders.

THE EVOLUTION OF CORRECTIONAL POLICY

In an effort to compete for limited resources and gain public support, correctional policies have adapted over time to reflect the prevailing political ideology. This chameleon-like shift in policy has resulted in two very different approaches to achieving the correctional goal of public safety.

The Rehabilitative Ideal

The Rehabilitative Ideal served as the basis for our criminal justice system from the early 1900s until the 1970s. It was an outgrowth of the positivist school of thought, which assumed that criminal behavior was determined by biological, sociological, and psychological factors over which people have little control. As such, the focus was on identifying and addressing these factors as a way to curb criminal behavior. The

Rehabilitative Ideal involved the Progressives’ plan for individualized treatment, which featured broad discretionary practices, and reflected their abiding faith in the state to act in the best interests of the offender.^[2,3] Offenders were sentenced to an indeterminate period of incarceration (e.g., 2–5 years) with their release based on their demonstrated reform.^[2] Probation was introduced as an alternative to incarceration for those who did not require incarceration, and parole was instituted to facilitate an offender’s reintegration to the community.

Several events throughout the 1960s and 1970s led to the dismantling of the rehabilitative agenda. In 1974, Robert Martinson published an article about what works in offender reform. In the article, Martinson reviewed 231 community- and institutional-based programs and concluded that there was no appreciable evidence that rehabilitation works to reduce the recidivism of offenders.^[4] While Martinson is often credited for undermining rehabilitation, several authors speculate that the lost faith in rehabilitation was more of a reflection of the times than a careful consideration of Martinson’s research.^[2,5] The 1960s were turbulent times with protests against Vietnam, Watergate, the deaths at Kent State, and the emergence of the Civil Rights movement. For conservatives, these times were signs of a disintegrating moral order; for liberals they were signs of a corrupted government.^[2] Both views prompted changes in the criminal justice system.

According to Cullen and Gilbert,^[2] conservatives viewed rehabilitation strategies as signs of a permissive society. They believed that the criminal justice system was coddling offenders and decreasing the costs of crime by releasing offenders early. They called for determinate sentences (i.e., a fixed period of incarceration) aimed at minimizing discretion and tougher sentencing practices designed to restore social order. Liberals, believing that the government was “using the mask of benevolence” to inflict suffering on offenders, agreed that discretion must be limited through the use of determinate sentences. However, they wanted to reduce the length of sentences to minimize the harm caused by the coercive prison environment. In the end, punishment won out,^[3] and the get-tough movement was set into motion.

The Get-Tough Movement

The get-tough movement is characterized by deterrence and incapacitative-based strategies. The concept of deterrence can be traced back to the 1700s and the classical school of thought.^[6,7] The classical school of thought assumes that people are rational beings who calculate the benefits of crime against the potential risks of getting caught and behave according to what will bring them the most pleasure and the least pain. Thus, according to deterrence theory, as the severity, swiftness, and certainty of punishment increases, crime will go down. Tough-on-crime policies such as mandatory sentences, truth in sentencing, and three-strikes legislation are designed to create special deterrence for the individual experiencing the punishment and general deterrence for others who observe the punishment.^[8]

Incapacitation, which emerged in the early 1980s, is designed to prevent crime through the physical constraint of individuals. Advocates of incapacitation make no claims of offender reform; they simply assert that offenders will not be able to commit crimes against society while incarcerated or otherwise restrained.^[9,10] Incapacitative measures are seen by many as the shortest path to public safety and thus, are popular in the American culture that is permeated by the principle of efficiency.^[11] Together, incapacitative and deterrent ideologies have contributed to unmanageable growth in the U.S. correctional population.

THE CONSEQUENCES OF GETTING TOUGH ON CRIME

Unmanageable Growth

The persistence of the get-tough movement over the past 30 years has contributed to an expanded net of social control in the United States. According to the Bureau of Justice Statistics, there were 6.5 million people, or 1 in every 32 adults, under some type of correctional supervision by the year-end of 2000.^[12] Of this correctional population, one-third, or 1,933,503 people, were in prison or jail, an annual increase of 5.6 percent since the year-end of 1990 and the continuation of a trend that began in 1971.

It is often assumed that the growth in the prison population reflects an increase in crime rates, but comparisons of trends have revealed that changes in the crime rates and changes in the prison populations are loosely matched over time.^[13,14] Other explanations offered for the growth in prison population include the introduction of tough legislation such as mandatory sentences, truth in sentencing, and three-strikes legislation,^[15-17] and the increased willingness by judges to imprison convicted felons.^[18] Regardless of

the cause, the increasing prison population has created overwhelming challenges for the American correctional system.

In an effort to keep pace with the growing population, states have added 351 correctional facilities in the past decade.^[19] Still, many state prisons are operating at 15% above their rated capacity,^[19] a situation that creates management nightmares for prison administrators. Prison crowding has been found to contribute to negative psychological and physical reactions among inmates^[20] and to increased rates of violence.^[21] It also limits the number and quality of vocational, educational, and counseling programs that are available to inmates,^[22,23] and thus, impedes the extent to which correctional facilities can achieve the goal of rehabilitation.

Recognizing that it is impossible to build their way out of the current correctional crisis, states have instituted a range of community-based correctional options that are designed to divert low-level offenders from prison. Two of the most popular programs are intensive supervision programs (ISP) and electronic monitoring, which are typically operated by probation and parole agencies. The defining characteristics of ISPs are small caseloads (e.g., 25-40 offenders) and an emphasis on controlling offenders in the community through increased contact, drug testing, and stringent responses to technical violations.^[24] Electronic monitoring involves the electronic surveillance of offenders to assure compliance with home confinement.^[25] Other, less popular, options include community service, house arrest, and day reporting centers. Despite their community placement, all of these correctional options (often referred to as intermediate sanctions or alternatives to incarceration) are tough programs designed to protect the public by providing close surveillance of offenders in the community and quick responses to violations or new criminal behavior. These tough new programs were well received by the public, politicians, and practitioners because they "shared the rhetoric of punishment but offered to accomplish crime control at a reduced cost."^[26] Their continuing popularity has contributed to an alarming growth in probation and parole populations.

By the end of 2000, approximately 4.6 million men and women were on probation or parole, representing an annual increase of 3.6% since 1990.^[12] Unfortunately, state budgets have not kept pace with the growing probation and parole populations. Despite the fact that three-fourths of the correctional population is under probation and parole supervision, only about one-tenth of the correctional budget is allocated to probation and parole agencies.^[27] This translates into high caseloads for officers: The national average for the number of cases per officer is 124 for probation and 67 for parole.^[28] As is the case with the prison

system, this type of unmanageable growth in probation and parole populations has limited the scope of services that can be provided to offenders. Without the type of meaningful treatment and supervision that is capable of promoting long-term behavioral change, significant reductions in recidivism are unlikely and the correctional system appears inadequate in its pursuit of public safety.

Lack of Credibility

Public opinion polls have repeatedly revealed that what the public wants from corrections is to be safe from crime.^[29–32] Thus, in the eyes of citizens and public officials, the value of correctional policies lies in their ability to reduce recidivism and crime rates. Repeated news reports of heinous crimes committed by offenders under correctional supervision have contributed to a lack of confidence in the correctional system. Unfortunately, the results of more objective outcome studies would do little to bolster this confidence.

Recidivism rates generally refer to the proportion of offenders under correctional supervision who are arrested or convicted for a new crime. A national study of adults on probation found that 43% of probationers were rearrested for a felony within three years of their probation sentences.^[33] Recidivism rates for parole are equally disheartening. According to a recent report by the Bureau of Justice Statistics, about 60% of parolees were returned to prison in 1999; 70% of those returned had been arrested or convicted for a new offense.^[34]

Studies of control-oriented, intermediate sanction programs have revealed that they are no better at reducing recidivism than the more traditional probation and parole programs. As compared to control groups of offenders placed in other correctional options, participating offenders had an increase in technical violations (i.e., violations of the rules of probation/parole) but no significant differences in the rates of new arrests.^[35–38] In fact, a meta-analysis of studies on these control-oriented intermediate sanctions revealed that they produced a slight increase in recidivism.^[39] As a result, more offenders in these specialized programs are returned to prison, thus limiting the extent to which any diversionary effect or cost savings can be achieved.

Recidivism rates and studies, such as those cited above, show that a substantial proportion of offenders (the people most directly affected by get-tough strategies) are not deterred from future crime. Crime rates offer a better reflection of whether or not these strategies are providing a general deterrent. The two primary methods of crime measurement are the Uniform Crime Reports (UCR), which reports on crimes reported to the police, and the National Crime Victimization

Survey (NCVS), which estimates crime rates based on interviews with members of a nationally representative sample of households in the United States about victimization they have experienced in the past year. According to the UCR, rates of serious crime in 2000 were 14% lower than in 1996 and 22% lower than in 1991.^[40] Statistics from the NCVS reveal a similar downward trend since 1993.^[41]

There are disparate views as to whether these statistics provide support for get-tough legislation. Langan, for example, sees the rising incarceration rates from 1973 to 1986 and the concomitant decline in crime rates as evidence that prisons were “responsible for sizable reductions in crime.”^[18] Similarly, a report by the National Center for Policy Analysis concludes that the recent reduction in crime can be attributed to an increase in “expected punishment” (i.e., an increase in the likelihood of going to prison and the median sentence length).^[42]

Other research disputes the role of imprisonment and other get-tough strategies in reducing crime. For example, given Langan’s contention regarding the benefits of prison, how would he explain the increase in violent crime in the wake of rising incarceration rates from 1986 to 1993?^[43] Reiss and Roth report that violent crime rates remained stable despite a tripling in the average prison time served per crime.^[44] Similarly, Visher examined several studies on the effect of incapacitation and concluded that despite a doubling of the prison population crime, reductions were limited to 10–30%.^[45] Spokespersons for the Campaign for an Effective Crime Policy summarize the debate in a 1995 report by concluding that “clearly, imprisonment has an incapacitative effect on the individual offender. The key issue, however, is whether increased imprisonment results in an overall decrease in crime and at what cost.”^[46]

A review of recidivism studies and crime rates reveals little support for get-tough policies. Despite this, they persist as the basis of the American correctional system leaving correctional administrators to deal with large populations, limited resources, and a lack of public confidence. The remainder of this article will focus on measures that are being taken to overcome these obstacles.

MOVING TOWARD RATIONAL CORRECTIONAL POLICY

Keeping pace with the growing correctional populations and managing constant change is no easy task. Proposed solutions often are nothing more than stopgap approaches designed to appease a particular audience. Four recent trends, however, represent a sincere effort to find long-term answers and to interject

rationality and accountability into the system. Following are brief discussions on how community justice initiatives, privatization, structured decision making, and the development of research-based intervention programs are improving services and decision making in the correctional systems.

Community Justice

Traditional correctional practices, whether rooted in rehabilitation or deterrence and incapacitation, have focused on things to be done *to* or *for* offenders.^[47] One of the most persistent trends in corrections is to shift from this offender-focused model of justice to a model of community justice that “places the community and victims at the center of justice activities and efforts.”^[47] Toward this end, correctional agencies are redefining the way they do business. Instead of working as a closed system, in isolation from the community, they are seeking community input and developing opportunities for citizen involvement.

A common approach to involving citizens is through the use of community advisory boards. Most states have some form of citizen advisory board although the composition and functions may differ. The role of the 21-member State Advisory Board in New Jersey, for example, is to advise the Supreme Court on matters related to probation. The Community Corrections Advisory Committee in Multnomah County, Oregon, is a statutory requirement of the Community Corrections Act adopted in 1977; it helps develop the county’s community corrections plans and oversee its operations. Advisory boards bring many benefits to corrections agencies including a sounding board and a set of allies for correctional personnel, diverse views and perspectives, access to private and public resources, accountability to the public, and a forum in which public officials and private citizens work together on developing opportunities and strategies for change.^[48]

Another common approach to involving citizens in corrections is through restorative justice initiatives. Restorative justice is a philosophy that views crime as a violation of people and interpersonal relationships.^[49] As such, it seeks to repair these relationships by: 1) providing victims with support, opportunities for input, and restitution; 2) holding offenders accountable for the harm they caused; and 3) empowering communities to develop constructive responses to crime that recognize our mutual responsibilities to one another.^[50] Two of the more popular restorative justice programs include victim offender mediation (VOM) and community sentencing panels. The VOM programs provide an opportunity for the victim of a crime to meet face-to-face with the offender and a volunteer mediator

to discuss how the crime has impacted their lives and to work out an agreement for restitution.^[51] Community sentencing panels involve citizen volunteers in the sentencing of offenders. For example, in Minnesota, volunteers serve on a community intervention team that communicates to offenders the impact of their behavior on the local community, sets special conditions of probation, provides support to offenders, and periodically reviews offender progress.^[52]

Although there is evidence to suggest that these types of programs lead to an increase in both victim satisfaction and citizen awareness of the justice process, there is little research available to ascertain the extent to which community and restorative justice initiatives are effective in controlling crime.^[51] Despite this lack of evidence, and unlike other correctional initiatives, community and restorative justice have gained acceptance from both conservatives and liberals.^[53] This widespread appeal and the pragmatic need to expand resources and support for correctional services is likely to sustain the movement toward a more open and inclusive system of justice.

Privatization

Complaints about ineffective practices, crowding, and rising correctional costs have led policy makers to turn to the private sector for solutions. Although private non-profit organizations have a history of involvement in the provision of diversion and drug treatment programs for offenders in the community, it has only been since the early 1980s that private for-profit corporations have engaged in the full-scale operation of prisons.^[11] There are several objections to the privatization of prisons. Most of the controversy, however, surrounds the issues of the profit motive and the right to punish and use force. It has been argued that the profit motive of private corporations will contribute to a lower quality of services in an attempt to cut corners and to lobbying for excessive use of incarceration because it is good for business.^[54,55] More fundamental is the concern about granting private corporations the power to punish and use force.^[56] Some authors claim that punishment is a government function and that granting this right to private corporations undermines the legitimacy of the state.^[57,58]
